Mr. Caird proceeded to say that the principles on which the system of collecting returns proposed by him was based, were—1. The main object is to obtain trustworthy returns, and these with the least necessary expense. 2. Trustworthy returns can be obtained only through trustworthy officers, responsible for the correct performance of their duty, and working under a system which affords a ready test of accuracy. 3. Economy will be promoted by employing a small number of competent and responsible men, rather than a very numerous body of local officials, each of whom must receive a fee, while they would be comparatively irresponsible, and, from their numbers, subject to no satisfactory test of accuracy. 4. As the returns, to be useful, must be made within a very short time after harvest, and before much of the corn can be threshed, they must necessarily be of the nature of an estimate, in so far as the yield per acre is concerned. 5. It is desirable, for many reasons, that the collection of the returns be made in a manner as little inquisitorial or offensive as possible; if either, they will be apt to fail in their main object—correctness. The employment of confidential officers, bound to secresy, will be a guarantee against the use of the returns for any but public purposes. 6. The first point to be ascertained is the acreage under each different crop; and this, as will be shown,* is by far the most important part of the inquiry. This will be not an estimate, but a record of facts. It is requisite, therefore, that it be conducted with care and deliberation; and, as it may be begun as soon as the seed is sown, the three months of May, June, and July may be occupied in this part of the inquiry. 7. There can be no reasonable objection on the part of any occupier to an inquiry as to the manner in which the surface of his farm is cropped. That is quite a different question from demanding to know the total produce of his crops. Nor would there be the same objection on the part of the farmers to answer such questions when put by a responsible and confidential officer, as by what might be thought a prying and irresponsible neighbour. 8. The varying measures and weights in use throughout the country are a further argument in favour of competently qualified officers who could personally ascertain the local measures, and convert them into the recognised standard; and this might be made the direct means of introducing and gradually establishing a uniform standard of weights and measures. 9. The acreage under each different crop having been ascertained, the occupier would be required to say not what was the actual produce of a particular field, but the actual produce per acre of each crop on his farm in ordinary years. 10. Before harvest these important facts would thus have been ascertained, viz.:—1st, The extent under each kind of crop. 2d, The average produce per acre of ordinary years. There would remain to be ascertained after harvest only—3d, How much the yield of that crop was above or below the average. 11. The effects of good or bad cultivation on each farm having been ascertained by the average produce, it follows that the effects produced by good or bad weather would be all that would remain to be learned after harvest; and, as the effects of weather over a parish would be pretty uniform, a single answer from a competent judge of light and heavy soils in each parish would fix this point. An alteration in the average quantity to the requisite extent could be made with great facility. 12. It will be necessary that each collector of returns be provided with an accurate map of the districts committed to him, and a correct list of the occupiers of land in each parish. 13. The Tithe and Inclosure Commission Office is suggested, as it affords a machinery already organised, with competently qualified officers locally employed in every part of Great Britain. This office is also possessed of the most complete system of maps of the various districts of the country which can at present be had. From these and the ordnance surveys, with local information, a very accurate map of each county and parish could be compiled. An accurate list of the occupiers of land would be obtained from the collector of rates in each parish. Taking the foregoing data as the principles on which to conduct the inquiry, we should proceed thus:—*Plan of Operations.* We shall suppose a branch of the Tithe and Inclosure Commission Office, or such other office as the Government may deem most suitable, to be the central office for issuing instructions, controlling officers, inspecting and testing the accuracy of the returns, and for arranging them for publication. One, two, and in some cases, three collectors of returns for each county, according to its extent, would be appointed. These would be selected men, of known competence. Each collector would be employed on an average 90 days before harvest in ascertaining the acreage under each crop, and other particulars, and 10 days after harvest in ascertaining the comparative yield of the last crop. The collector, provided with his map and list of occupiers, would between the 1st of May and the end of July, personally visit every occupier of land within his district, and mark down in a book the several particulars required to be ascertained. This book would, when completed after harvest, be forwarded to the central office in London, and would be preserved for being afterwards tested by the personal inquiry of a superior officer. Immediately after harvest, the collector would again visit each parish in his district, and satisfy himself as to whether the crop of each kind was an average, or in how far it was above or below an average. Having already calculated the average produce of each crop in a parish, he would alter that to correspond with the actual produce of the particular season. Thus, for example, if he had ascertained that a certain parish had 1500 acres in Wheat, which, at the rate of the average of years yielded 39,000 bushels, but that the actual yield of that year had proved 2 bushels an acre below the average, he would subtract 3000 bushels from the above quantity, and return 36,000 bushels as the estimated yield of Wheat in that parish. The main part of the calculations having been completed before harvest, the alterations necessary after harvest would be made with great facility, and the gross returns of the crops be ready for publication by the 10th of October. Monthly reports of the state of the growing crops at the most critical period would be made during the three months of inquiry. It would be part of the duty of the central office to test the returns of every collector by an inspector taking his returns for a particular parish, and investigating on the spot each statement recorded. This should be done in spring, so that the estimate might be compared with the fact after the crop was threshed out; and thus any carelessness or gross inaccuracy would be detected, and a useful guide be supplied for the future. Incompetency or carelessness would be visited with loss of employment. After the gross returns of produce were issued, which would be the first object, it would be the duty of the central office to compile from the returns such valuable statistics as had a special bearing on the agricultural improvement of the kingdom, and of every separate district in it. As to the expense of obtaining the returns, it is obvious that there will be considerable economy in taking advantage of an existing department of government, such as the Tithe and Inclosure Commission, upon which this scheme might be without much difficulty engrafted. The officers employed in the various parts of the country by this department are chiefly occupied at present in the autumn, winter, and spring months, so that the duties of this inquiry would not interfere much with their ordinary duties. For the first year a greater number of persons would be required to organise the system, but in after years the whole cost would certainly not exceed 25,000*l.* per annum. When it is considered that the estimated produce of the United Kingdom in grain of all kinds is 60 million quarters annually, 40 millions of which come upon the market for sale, and that 1*s.* per quarter of fluctuation in price amounts to 2,000,000*l.* sterling, the cost of collecting accurate information which should limit this fluctuation by only 1*s.* a quarter would be repaid one hundredfold. Each year's experience would render these returns more perfect, as all the persons engaged would acquire greater accuracy in every branch of the inquiry.

* The greater importance of ascertaining accurately the number of acres under each crop than the yield per acre, is shown by the Statistical Returns of Ireland, which tell us that

In 1849 there were	687,646 acres of Wheat, yielding	2,148,893 qrs.
In 1852	„ only 353,566	„	1,151,205 qrs.
Decrease in acres . 334,080		In Wheat .	994,688 qrs.

But, if the variation above or below average produce had been alone taken without inquiry at the same time, as to the proportion of acres under Wheat, the returns would have been entirely fallacious, the yield per acre in 1852 having averaged 26 bushels against 25 in 1849. Thus, taking the acreage of 1849, 687,646, and applying to it the average yield of 1852, the returns would be 2,234,849, which would be an error of no less than 1,080,644 quarters beyond the actual produce of 1852. The ascertainment of the area under each crop is thus clearly the most important part of the returns, and this branch, as already mentioned, may be conducted with care and deliberation, as it extends over a period, if necessary, of three months.

At the adjourned discussion, Mr. Lumley stated the Government plan which had succeeded in Hampshire and Norfolk. He said:—

It had been employed with remarkable success. The failure—if such a phrase could be used—in embracing the statistics of these two counties was only from 2 to 4 per cent. Inspectors had a county each under their control, and were assisted by district unions. Every union formed its own statistical committee, and took cognisance of three or four parishes. Forms, returns, and schedules were duly delivered to occupiers of the land, to .. l up with the number of those employed under them. Obstacles had been thrown in the way, and gross misapprehensions had en entertained by many residents in these counties, but they had been in a great measure removed by explanation and pers al communication. Some might wish to adopt as a working machinery the tithe commission. That would be useless, as its staff of officers would soon be broken up. But the Poor-law Board was fixed for centuries, and was permanently arranged over the whole face of the country.

Mr. Leone Levi then referred to his plan for collecting the information desired; and we confine our report to the statement of the three plans, not having room for the discussion which ensued upon them, to which reference has been shortly made in a leading article:—

Two great machines would be required—a good central board possessing all the requisite knowledge of the subject, and of the instrumentalities to be used; and a local organisation possessing some influence. The tithe commission, combined with some of the Poor-law Board, would get the best and most accurate particulars. He read the following resolutions, which embodied his views as to gathering agricultural statistics:—1. That a central commission be authorised to obtain from the several boards of guardians in England and Wales annual returns of the total acreage comprised in each union, showing therein the total acreage of each parish or extra parochial place within the union separately, together with the acreage of the several crops or state of the whole land in such parish. 2. The board of guardians to be authorised to prepare the requisite returns by such ways and means as they may deem most expedient, having due regard to the utmost practicable accuracy as well as economy. 3. These returns to be forwarded to the central board on or before the 1st of June in each year, for the purpose of arrangement and publication. 4. Meteorological observations to be made throughout the country, and monthly accounts of the same to be forwarded to the central board, deducting the influence of the weather on the growing crops at the most critical period during the three months previous to harvest operations. 5. That the central board be authorised to appoint one fit and competent inspector in every county in England and Wales, to undertake the superintendence of certain defined districts, and report to the central board, on or before the 1st October, what in his judgment would be the average yield of the several crops in the district so superintended. 6. Such district to represent as far as possible the average of the county in which it is situated. 7. Each inspector's return to be signed by him, and to be published. 8. The several inspectors to be instructed to furnish the central board with such general remarks as to those crops on the lands in his county, not included in the district specially assigned to him, as he may deem important. These returns, when received, to be published by the central board without delay. 9. The expenses incident to be about 40,000*l.* per annum, and to be defrayed by Government. 10. The Highland and Agricultural Society of Scotland to be entrusted with the collection of agricultural statistics of that part of the kingdom, to be published in the same form, and as nearly as possible at the same time as those of England and Wales. The agricultural statistics of Ireland to be collected on the same plan by means of the stipendiary force which has hitherto performed so well those duties.

Farmers' Clubs.

LONDON.—On Wednesday, a paper was read by Mr. Spooner on *Liquid Manuring*, a report of which, and of the discussion which ensued upon it, we must postpone till next week.

Reviews.

A Treatise on Pigeons. By J. M. Eaton. Author of "The Almond Tumbler." Published for the Author at 7, Islington Green.

WE have more than once been asked for a book on this subject, and have now the pleasure of recommending the one before us. It is apparently a collection of publications on the subject, and these somewhat multifarious and ill-arranged; but it is full of practical and useful information—the advice and experience of a man who has long made its subject his study.

Miscellaneous.

Agricultural Machinery and Implements.—The exhibition of machinery and implements, in connection with the Cattle Show of the Smithfield Club, held recently

in Baker Street, was of a very interesting character. We availed ourselves of the opportunity there afforded of inspecting the American threshing-machine, to which we had occasion to make reference in No. 1573 of our current volume. The result of our examination of this machine is an entire confirmation of what we before suggested concerning it; namely, that its novelty consists in but very little more than a mere modification of certain mechanical arrangements already well known and in extensive use. Those of our readers who are acquainted with the threshing-machines already in extensive use in this country will probaby read the foregoing description with some surprise, and will be able to estimate the real value of the invention, upon which Mr. Mechi has freely bestowed his praise, and of which English journals have written with so much laudation. Does its novelty consist in the revolving pegs, or in the travelling apron, or in the winnower, or in the screw? Or is it not rather to be seen only in the bringing together of these familiar parts into one machine, and mounting it upon wheels? The latter surmise is the true one. But we must not omit to state, that if the machine exhibited is to be considered a fair specimen of the American machines, as it no doubt is, it is impossible for English agriculturists to adopt them; for of all the machinery and implements exhibited, it was decidedly the most fragile and imperfect. The contrast between it and the machines of Garrett, Ransome, Dray, and other English manufacturers, was certainly very apparent. In fact, we are convinced that a machine similarly constructed, and sufficiently strong to bear the wear and tear of its operation for any reasonable length of time, must necessarily weigh much more than 14 cwt., which is said to be the weight of the American machine. We are anxious to insist upon this point, because of the error which has been so commonly propagated in unscientific periodicals concerning the relative cost of this and of our own machines. The fact is that the low cost of the American machine is entirely due to its inferiority. We have not space to notice at length the variety of new instruments exhibited, many of which were of evident worth. We especially regret the want of an opportunity to point out what we conceive to be serious defects in the principle of Smith's reaping, and several other machines; there is perhaps, however, but little necessity for this, since it is a fact, as we are willing to allow, that British farmers generally are not likely to adopt any invention which has not a well-established reputation both for utility and economy. In conclusion, we cannot refrain from pointing out the attempt made to palm off, as Bell's reaper, a machine of which the form of blade introduced by Mr. M'Cormick was, perhaps, the most conspicuous feature; and we may also add, that Mr. M'Cormick's blades were employed in nearly the whole of the reaping-machines on exhibition. *Mechanics' Magazine.*

Calendar of Operations.

MARCH.

LAMMERMUIR SHEEP FARM, *March* 21.—Ewes are now put on Turnips during the day with a run off at night. Those ewes which are crossed with a Leicester tup begin to lamb on or about the 1st April, and those with the pure Cheviot, lamb a fortnight later. In this district the system of crossing as above has been very considerably practised of late years. Many farmers cross their whole flock of ewes, and buy in small or second Cheviot lambs in autumn, to keep up their Cheviot stock. This is, perhaps, not carried to the same extent this season as formerly, owing to the very high prices which had to be given for small Cheviot lambs last year. This system, where a regular breeding mountain stock is kept, has very little to recommend it, as if pursued for a number of years, the stock degenerates sadly, from the inferior quality of the bought in lambs; and is only to be tolerated on the farms which are mostly arable, and where extra treatment can be given to the stock (generally small) by means of Turniping well during winter. But even then the breeding ewes will be an inferior and incongruous lot, entirely deficient in that similarity of shape, countenance, and contour so telling and so pleasing in the well-selected and carefully-bred flock. The large prices obtained for lambs of the above-mentioned cross, of late years, induced many to pursue the system further than a due regard to the ultimate quality and profitableness of their flocks will warrant. The Turnip crop is now nearly consumed, and few farmers have been able to reserve a sufficient quantity for spring use. About six weeks' Turnips are usually considered sufficient for Cheviot ewes in spring, commencing to give them about three weeks before the beginning of the lambing season. From the scarcity of Turnips, Grass is letting uncommonly high—from 30*s.* to 50*s.* per cent. above last year's rents; and many Grass fields are already stocked. Cheviot hogs are now turned to the hills. The usual plan in this district is to give the hogs half Turnips during winter, beginning them about the end of November, and continuing up till about the first or second week in April. This season, from the want of Turnips, they are turned off to the hills a fortnight or three weeks sooner than usual. *Lammermuir.*

Notices to Correspondents.

BOOKS: *J W Reilly.* Blackie's "Agriculturist's Calculator."—*P P.* Low's "Elements of Practical Agriculture;" Stephens' "Book of the Farm;" Blackie's "Cyclopedia of Agriculture."

DAIRY: *K B.* The American churn has been generally approved of, and is very suitable to the quantities you name.

GRASS LAND: *A B.* will probably find 1 cwt. per acre of nitrate of soda to be as efficient a dressing for his Grass as an equal value of any other manure. Apply it in wet weather in this month. It may be applied to Wheat, Barley, and Oats.

HEMP: *Tyro.* It likes deep rich alluvial land. It should be sown in the end of this month, or beginning of May. Two bushels of seed per acre are sown broadcast upon well manured land. Full details of after culture are given in agricultural works. See "Hemp" in Blackie's "Cyclopedia."

MINERAL COAL TAR: *L.* asks where it is to be had. The answer, which we are unable to give, is properly an advertisement.

ERRATA. In the article on "Bean Straw," p. 203, first column, second and third lines of Table, for "Oil (Oat straw), 40," read "Oil, sugar, gum, &c. (Oat straw), 40." In second line from bottom, for "40 gum protein, &c.," read "40 per cent. gum pectine, &c." In second column, after the Table of comparison with Turnips, read "Shows a like per-centage in my food of protein, and a less in oil, starch, &c." *T.*

TESTIMONIAL
TO
J. B. LAWES, ESQ., OF ROTHAMSTED.

A number of Herts Tenant Farmers, influenced as well by their knowledge of Mr. LAWES' private worth as of his public services, met by previous arrangement, at the Town Hall, St. Albans, on December 24, 1853, for the purpose of considering the best manner of promoting and presenting him with a TESTIMONIAL in acknowledgment of those services; and since the benefits which he has conferred upon Agriculture could not be considered as merely local, it was desired, if it were found that the movement was responded to in other districts, that it should be in some degree a national one, though, from the great interest which it is known is taken by many foreign visitors in the researches at Rothamsted, Mr. LAWES' services cannot be considered as even limited to this country.

It was considered—that Mr. LAWES has for many years been engaged in a series of scientific and disinterested investigations, for the improvement of agriculture generally; which, having been carried out to an extent—with an attention to accuracy and detail—and at a cost never before undertaken by any individual, or even by any public institution. That, besides the Laboratory and other labours, from 40 to 50 acres of land are devoted exclusively to these investigations, the results of which, he, from time to time, gives freely, faithfully, and without exaggeration to the public, in the various agricultural periodicals. It was also considered, that he had, after a persevering course of practical experiments, introduced into the Turnip culture of this country, means more successful than any other known, for insuring the crop; whereby, the value of certain lands, and the produce of corn, meat, and wool, particularly in certain districts, has been much increased.

It was unanimously agreed by the Meeting, that a GENERAL ACTING COMMITTEE, from the County of Herts, should be at once formed, for the purpose of promoting such a Testimonial to Mr. LAWES as would be worthy the acceptance of a man who may thus be considered as a benefactor to his country.

It was also agreed, that prior to issuing a General Circular, and thus giving a more national character to the movement, the Herts Committee should, through their Secretary, communicate with owners and occupiers of land in various parts of the kingdom, for the purpose of ascertaining their feeling in regard to it; and also, with a view to the formation of an HONORARY COMMITTEE.

In many of the letters that have thus been received, the most gratifying testimony has been given, as to the respect in which Mr. LAWES' services are held by various classes of the agricultural interest; and, the following is a list of those Noblemen and Gentlemen interested in the improvement of agriculture, who have up to the present time given in their names as members of the Honorary Committee.

HONORARY COMMITTEE.

Ashburton, the Rt. Hon. Lord
Ames, Colonel
Alexander, Caledon, Esq.
Baker, Sir E. B., Bart.
Baldwin, W. T., Esq.
Betts, A., Esq.
Breadalbane, the Most Hon. the Marquess of

Whatman, James, Esq., M.P.
Walter, William, Esq.
Windsor, the Hon. and Very Rev. Dean of

Chairman of the General Acting Committee—Mr. F. GOUGH. *Treasurer*—T. W. OVERMAN, Esq.
Honorary Secretary—Mr. WILLIAM KERL, Harpenden, St. Albans. *Bankers*—London and County Bank, and its Branches.

Contributions may be paid by draft or Post-office order, on the St. Alban's Office, payable to T. W. Overman, Esq., Flamstead Bury, St. Alban's; or at any of the Branches of the London and County Bank, to the credit of the Treasurer of the Lawes' Testimonial Fund.

In now making an appeal to the Agricultural Interest generally, the Committee would suggest for the guidance of the large body of Tenant Farmers, who, it is believed, will desire to record their respect and gratitude to Mr. Lawes for his services, that even a higher tribute of respect would be paid to him, by the contribution of moderate sums from *a large number of Subscribers*, than by that of large sums from a comparatively limited number.

It may be interesting to Mr. Lawes' friends to know, that in a letter which has been received from Sir J. M. Tylden (Chairman of a local Committee formed in Kent, for aiding the movement in that County), he has communicated the result of a discussion which had taken place at a meeting of the Kentish Committee, as to what might might be considered a fit memorial to present to Mr. Lawes. It was suggested by that Committee, that as an *Heir-loom*, a piece of plate might be the more suitable; but that, in addition to this, to build him a new Laboratory for the prosecution of his Agricultural Investigations, would be exceedingly appropriate to the services which it was wished should be acknowledged; and it was thought that, in this point of view, the presentation of the Testimonial in some such form would probably be more acceptable to Mr. Lawes than that of any other. Decision on this point is, of course, at present quite premature; but, as these suggestions from the Kentish Committee are fully coincided with by the General Acting Committee, it was thought it might be well, even thus early, to afford some intimation of what would, in due time, come more fully under the consideration of the Committees.

The next Meeting of the General Acting Committee will be held at the Town Hall, St. Albans, on Saturday, April 8, 1854, at half-past eleven.

The Committee will have much pleasure in at any time receiving suggestions (addressed to the Secretary), from Gentlemen interested in the movement, prior to meeting (as they eventually hope to do) such Members of the Honorary Committee, or Deputations from District Acting Committees, as may signify their desire to confer as to the final appropriation of the fund.

W. KERL, Hon. Sec.

AMONG THE SUBSCRIPTIONS ALREADY ANNOUNCED ARE THE FOLLOWING:—

JAMES BARTON, Ironmonger, &c.; Manufactory and Warehouse, 370, Oxford Street (a few doors east of the Pantheon), London.

PURVEYORS OF LIVE BIRDS

BY SPECIAL APPOINTMENT TO HER MAJESTY AND H.R.H. PRINCE ALBERT.

BAKER'S POULTRY RESTORATIVE.—Ten years' experience of its success, in all Diseases of Poultry, justifies them in recommending it with the greatest confidence; one among its many advantages being the facility with which (in its liquid form) it is administered, obviating the troublesome necessity of handling the birds, and speedily imparting such vigour and high condition that can be acquired by no other means. Price 2*s.* 6*d.*, either in Liquid or in Pills, with directions for Roup, &c. By all Chemists.

BAKER'S REGISTERED FOUNTAINS, for Poultry, Pheasants, and Pigeons, supplant all others. Four quarts, 6*s.* 6*d.*; nine quarts, 8*s.* 6*d.*—Messrs. BAKER, City; and the Pheasantry, Beaufort Street, Chelsea.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

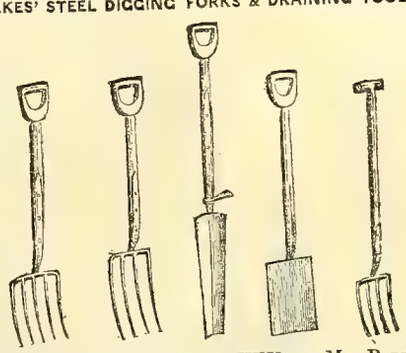
BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

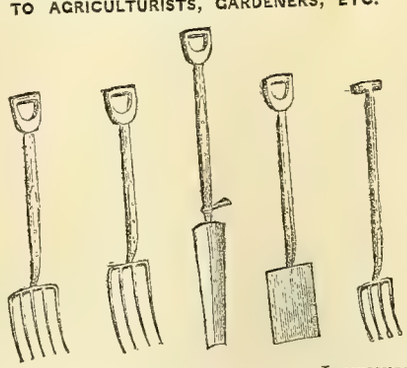
PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

TO AGRICULTURISTS, GARDENERS, ETC.



BENNETT AND NAYLOR, GENERAL IRONMONGERS, and FACTORS, Sole West End Agent for PARKES', late WINTON PARKES' CELEBRATED STEEL DIGGING FORKS and TOOLS. Also for the only efficient Stove, with or without a flue, suited particularly for Conservatories and Greenhouses, Patronised by her Majesty. Price 12*s.*, and upwards, at the Great Western General Ironmongery Warehouse, 255, Oxford Street, between Park Street and North Audley Street. Established for the sale of all descriptions of Ironmongery at Wholesale Prices. Sheet, Hoop, Rod, and Bolt Iron; Locksmiths and Bell-hangers. Patent Fuel, to be used with the Stove, 2*s.* 3*d.* per bushel.

HALL'S GARDEN NETTING, the best protection against FROST, STORMS, OR SCORCHING HEAT.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

FRUIT TREES, POULTRY, RABBIT, SHEEP, and CAT FENCING.—Worsted Netting to protect the Bloom of Peach, Nectarine, and other Trees, Flower, or Seed Beds, from Frost, Blight, and Birds, 2 yards wide, 5*d.* per yard. NEW TWINE NETTING (Tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; Half-inch Mesh ditto, 2 yards wide, 6*d.* per yard. TANNED NETTING, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard; or 5*s.* per 100 yards, 1 yard; 10*s.* per 100 yards, 2 yards; and 20*s.* per 100 yards, 4 yards wide. ELASTIC HEXAGON GARDEN NET, or Scrim Canvas, 4½*d.* per square yard. COCOA NUT FIBRE, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* to 6*d.* per yard. Rabbit Net, 4 feet wide, 1½*d.* per yard; 6 feet wide, 2½*d.* per yard; 8 feet wide, 3*d.* per yard. Each Edge Corded, ½*d.* per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing, against fowls, cats, &c., at W. CULLINGFORD'S. Orders by post with Post-office order or town reference, punctually attended to. The Trade supplied. Fishing Nets of all kinds in stock. Nets made to order. Tents, Marquees, Rick Cloths, Tarpaulin, Lines, Rope, Twine, &c., made to order.—1, Edmund-terrace, Ball's Pond Road, Islington, London.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

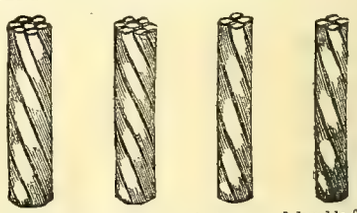
	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

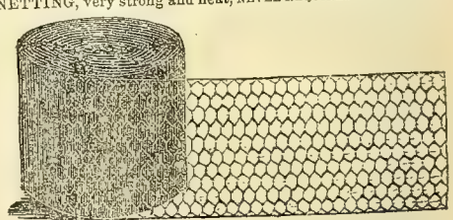
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.

24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

RICHMOND AND CHANDLER'S No. 1 CORN CRUSHER (Price 5*l.* 5*s.*) was first introduced a few years ago, as a decided improvement upon others theretofore made. Subsequent time and experience have served to render it more perfect, and to greatly extend the pre-eminent patronage of members of the Royal Agricultural Society, and distinguished scientific authorities throughout the world.—Address, RICHMOND & CHANDLER, Implement Works, Salford, Manchester; and 32, South John Street, Liverpool.

Export orders completed on the shortest notice.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

ADAMSON'S REGISTERED ORNAMENTAL GARDEN EDGING, a cheap, durable, and perfect substitute for all other Edgings, for Conservatories, Terrace Walks, or Garden Borders, being of an agreeable colour, a thorough drain for the walks, applicable to borders of any form or size, and does not harbour vermin. To be obtained only of the Inventor and Manufacturer, T. H. ADAMSON, Jun., Builder, High Street, Putney, where Prospectuses may be obtained on application.

May be seen laid down in the Horticultural Society's Gardens, Chiswick, where it has withstood the late severe winter.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

READ'S GARDEN ENGINES, SYRINGES, &c.—When an article of real utility attracts public attention, imitators start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice to exhibit in the windows of ironmongers and others Syringes of the VERY COMMONEST DESCRIPTION, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

READ'S Instruments have the royal arms, with the address—

35, Regent Circus, London.

☞ Descriptions sent post free.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

GIDNEY'S PRUSSIAN HOE.—Gardeners and Amateurs are informed that this useful Tool is now becoming a general favourite in the garden, and only needs a trial to be appreciated. Price 1*s.* 6*d.* handled. To be had of every Ironmonger and Seedsman. Manufactured only by GIDNEY & SON, East Dereham, Norfolk.

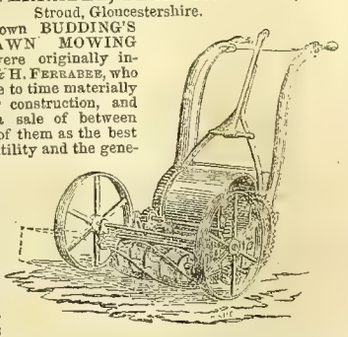
BUDDING'S LAWN-MOWING MACHINES, with Registered Improvements.

MAPPLEBECK & LOWE, MACHINISTS & MANUFACTURERS, Birmingham.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

THE IMPROVED LAWN MOWING MACHINE,
MANUFACTURED BY

J. AND H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.



The well-known BUDDING'S PATENT LAWN MOWING MACHINES were originally introduced by J. & H. FERRABEE, who have from time to time materially improved their construction, and can refer to a sale of between 4000 and 5000 of them as the best proof of their utility and the general satisfaction which they have given.

The Machines offered this year by J. & H. FERRABEE are superior to any yet produced, being perfectly adapted for cutting the Grass on Lawns and Verges, and between flower beds; while their strength and durability have been increased and their management simplified. Any person can use them effectually without the least practice. They can be adjusted to cut various lengths of Grass, and will produce a more even and uniform surface than the most skilful mower. The Grass is cut best when dry, so that a machine can be employed at the most convenient time to the workman, and more than double the work may be done with the same manual labour that is requisite with a scythe.

SIZES AND PRICES.		£	s.	d.
Hand Machine, for One Man, cutting	16 inches wide	5	15	0
Ditto for Two Men,	22 ditto ...	6	10	0
Pony Machine,	28 ditto ...	10	0	0
Horse ditto	36 ditto ...	16	0	0

The Horse Machine will cut the longest and coarsest Grass usually met with on Lawns and Pleasure Grounds.

London Agents:—Messrs. BOULNOIS & SON, Baker Street Bazaar, Portman Square.

TOBACCO PAPER! TOBACCO PAPER!

THE Cheapest and most effectual article for Smoking Greenhouses, and destroying the Fly on Plants, is Genuine Tobacco Paper, which JOSEPH BAKER, of 73, Fleet Street, can supply in large quantities, at 1*s.* per lb.; and if under 7 lbs. at 1*s.* 2*d.* per lb. Post-office Orders payable at the Strand Office.

JOSEPH BAKER, 73, Fleet Street, London (opposite the *Dispatch* newspaper).

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds	8 gallons,	throws 25 feet high	...	£2	15
No. 13	12	"	"	30	"	...	3	5
No. 11	16	"	"	40	"	...	4	0
No. 12	24	"	"	45	"	...	5	0
No. 14	30	"	"	45	"	...	5	18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

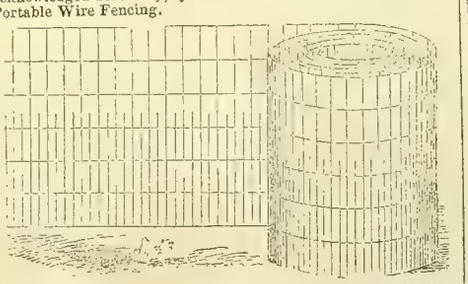
J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PORTABLE POULTRY FENCING, MANUFACTURED BY PATENT MACHINERY.

The great increase in the number and quality of POULTRY in the United Kingdom within the last few years has created a demand for an efficient Poultry Fence, which has called into existence every possible contrivance and adaptation of the Wire and Cord Netting, all of which have more or less proved failures.

B. GREENING & CO. have succeeded in supplying this acknowledged deficiency, by the introduction of a variety of their Portable Wire Fencing.



No. 11. PATENT DOUBLE FENCING (Proof against Poultry and Chickens).

This Fencing (which they manufacture by machinery, patented last year) is light, portable, and elegant in appearance, yet stronger and more durable than any Fence before the public. It requires few standards, and is fixed with the utmost facility by a labourer or gardener.

Notwithstanding the present high price of iron, B. G. & Co. offer these superior Fences at the following low prices:—

COCHIN CHINA FENCE.

36 inches high, 1*s.* 6*d.*; or, if Galvanised, 1*s.* 10½*d.* per lineal yard.
42 " 1*s.* 9*d.*; or, if Galvanised, 2*s.* 2*d.* "

SPANISH, OR DORKING FENCE.

5 feet high.....2*s.* 0*d.*; or, if Galvanised, 2*s.* 5½*d.* per lineal yard.
5 feet 6 in. high, 2*s.* 3*d.*; or, if Galvanised, 2*s.* 9*d.* "

NOTE.—It is a well-known fact, that fowl of these species will not fly over any fence, unless they can alight upon the top of it. To prevent this, B. GREENING & Co. have produced another variety of Fence, whose top, instead of being horizontal, is composed of a series of perpendicular wires, or spikes, thereby rendering it completely proof against even the lightest fowl of the above kinds.

FENCE TO CONTAIN THE SMALLER VARIETIES OF FOWL,
(Polish, Hamburghs, and the Common Kinds.)
6 feet high, 2*s.* 6*d.*; or, if Galvanised, 3*s.* per lineal yard.

Every information respecting this new and valuable system of Fencing may be obtained from BENJAMIN GREENING & CO., 1 and 3, Church Gates, and 2, Cateaton Street, Manchester.

Cattle Fencing, Sheep and Lamb Fence, Hare and Rabbit Proof Fencing, Ornamental Fencing for Gardens, Poultry Fencing, Trainers for Peas, Garden Bordering, Export Fencing, &c. &c., manufactured by Patent Machinery by BENJAMIN GREENING & CO.

1 and 3, CHURCH GATES, and 2, CATEATON STREET, MANCHESTER.

(Prospectuses and Engraved Sheets of Patterns, gratis.)

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cliveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom, as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The Machine is made to cut the breadths of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

Further particulars, with prices, may be had on application.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50*s.*, and upwards.

HEAL AND SON'S SPRING MATTRESSES.—The most durable Bedding is a well-made SPRING MATTRESS; it retains its elasticity, and will wear longer without repair than any other mattress, and with *one* French Wool and Hair Mattress on, it is a most luxurious Bed. HEAL & SON make them in three varieties. For prices of the different sizes and qualities, apply for HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced LIST OF BEDDING. It contains designs and prices of upwards of 100 Bedsteads, and prices of every description of Bedding, and is sent free by post.

HEAL & SON, 156, Tottenham Court Road.

MECHI'S SHILLING PENKNIVES.—These and the SIXPENNY TOOTH-BRUSHES will prove that, whilst he has the most elegant shop in London, he is determined to do business on the most reasonable terms. He manufactures extensively on his premises, No. 4, Leadenhall Street, London, Desks, Work-boxes, Dressing-cases, Bagatelle Tables, Table and Small Cutlery, Razors, Razor Strops, Brushes, Combs, and everything for the work-table and dressing-toilet. Every article is warranted. He is the sole inventor of the Mechian Dressing-case, the Patent Castellated Tooth Brush, the Magic Strop and Paste, and the Peculiar Steel Razor. Beware of counterfeits, none being genuine without his Name and Address, No. 4, Leadenhall Street, London.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

ASTROLOGY.—Persons residing in London or elsewhere can send any Address, Christian and Surname, and Age, in a letter containing 13 postage stamps, to Professor MELVILLE, Princes Road, Lambeth, London (the only Acrostic Astrologer in the universe), and they will receive by return of post, special Poems on their names, in which their destinies will be revealed.

YOURSELF! WHAT YOU ARE, AND WHAT FIT FOR. ELLEN GRAHAM continues to give her novel and interesting delineations of character from an examination of the Handwriting, in a style of description peculiarly her own, filling the four pages of a sheet of paper. Persons desirous of knowing their true character, or that of any friend, must send a specimen of the writing, stating sex and age, or supposed age (including 13 postage stamps) to Miss GRAHAM, 14, Hand Court, Holborn, London, and they will receive in a few days a minute detail of the gifts, defects, talents, tastes, affections, &c., of the writer, with many other things hitherto unsuspected.

Seventh Edition, "A Few Words before Matrimony," price 6*d.* sent post free on receipt of six postage stamps.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTRIFICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

ELECTRICITY FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MR. MEINIG'S new and greatly improved GALVANIC ELECTRO GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishment, 103, Leadenhall Street. All wet and metallic contact with the body is entirely obviated; it acts with water alone, without acid, the action lasts more than 24 hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck. The extraordinary curative virtues of these mild currents of Electricity are now fully established by experience; the Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last 18 months, and this remedy is now adopted in nearly all the hospitals, and by the most eminent practitioners. Sold at 5*s.* upwards, according to power, at C. MEINIG'S, 103, Leadenhall Street. N.B.—It is impossible, when wearing a Generator, to be attacked by Cholera.

EASTER HOLIDAYS.

THE ZOOLOGICAL GARDENS in the Regent's Park will be open to Visitors on payment of SIXPENCE each, every day in the week, except Saturday.

THE ST. MARGARET'S ESTATE, RICHMOND. —The magnificent Mansion and picturesque Park at St. Margaret's, opposite Richmond Gardens, may be viewed daily, between the hours of Twelve and Five o'clock (Sundays excepted) by cards only, to be had of the EXECUTIVE COMMITTEE of the CONSERVATIVE LAND SOCIETY. The purchase-money having been paid up on Lady-Day, the allotment of this valuable Estate on the Banks of the Thames has been fixed for WEDNESDAY, the 7th of June. Cards will be duly forwarded to the Members and their friends, on application to the Secretary. St. Margaret's may be reached either by the River Steamers, by Omnibus to Richmond, or by the South Western Railroad, at the Twickenham, Isleworth, or Richmond Stations.

CHARLES LEWIS GRUNEISEN, Secretary.

Offices, 33, Norfolk Street, Strand; April 8, 1854.

THE DIVIDENDS PAYABLE ON THE 8TH AND FOLLOWING DAYS.—Families visiting London upon this occasion will find the best assortment of ELASTIC BALBRIGGAN SUMMER HOSIERY, at Balbriggan House, 33, Lombard Street, City.

NO CHARGE FOR STAMPING ARMS, CRESTS, INITIALS, &c., on paper and envelopes, at LOCKWOOD'S well-known establishment, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Envelopes, 3*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks, 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Mourning Stationery equally cheap. Wedding Orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands, Gold Pens, Church Services, &c. Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free.

THE CHOLERA

PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts, 2*s.*; Pints, 1*s.*; Half-pints, 6*d.* Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

HYGIENIC BATHS, A POWERFUL PROMOTER OF HEALTH AND WELL-BEING.—JENSEN'S Herbaceous Daphne Marina Salt for Baths, when dissolved in a cold, tepid, or warm bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known sea bath. Highly recommended by that distinguished Physician, Dr. Andrew Ure, M.D., F.R.S., &c.—Sold at 1*s.* per Packet, by C. MEINIG, 103, Leadenhall Street, and by all Chemists and Bathing Establishments.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.

ALL Sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, cash, or Post Office order, payable at the General Post Office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily, except Sunday, from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

THE ADVERTISER wishes to meet with a Capitalist to Advance, temporarily, from 1000*l.* to 2000*l.* on good security, by which advance a valuable property would be secured, in equal moieties, without cost. The advance would not be required for long, and would yield a good rate of interest until repaid. This is an excellent opportunity of making a good provision for a family, by a temporary advance of money, and without ultimate cost.—Full information will be given to *bonâ fide* applications from principals or their solicitors, addressed to MR. GOGIN, 320, Regent Street.

TO BE LET, suitable for a Florist or a Market Gardener, a FIVE-ROOMED HOUSE, with TWO ACRES of LAND, situated in Hampton Lane, close by the Parish of Hanworth, one mile from the Feltham Station.—Apply to Mr. GATFIELD, Hanworth; or to Mr. J. POOLE, Covent Garden Market, London.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

COCHIN CHINA FOWLS.

MR. THOMAS GILBERT, of Grays, Essex, having purchased of THOMAS STURGKON, Esq., his entire breed of 1853, Gentlemen and Amateurs are informed the Birds are now on Sale, and are bred exclusively from his best Stock Birds, Jerry and Nelson. Eggs may be had at 16*s.* per dozen, from the above.

EGGS.—An Amateur has some very good Partridge, Cochin China, Dorking, and White India Game Fowls' Eggs to dispose of, at 4*s.* 6*d.* per dozen. Also, a few young Partridge Cochin China Fowls, at 1*l.* 3*s.*, and Golden-laced Bantams at 18*s.* the pair, packing included. — Address, An Amateur, Matlock Bath, Derbyshire.

EGGS FROM PURE WHITE-FACED SPANISH FOWLS, at 10*s.* per set of 13.—Letters and Post-office orders to be addressed to Mr. JOHN COMPTON, Portchester, Fareham, Hants.

EGGS FROM WHITE-FACED SPANISH FOWLS AND PURE WHITE AYLESBURY DUCKS.—White-faced Spanish Fowls, pen 27 at Birmingham, pure white face, large size, and the cock's comb perfectly erect; Eggs 12*s.* per doz. Pure White Aylesbury Ducks, pen 1885 at Birmingham; the birds are of large size, bills and legs of a perfectly pure colour; Eggs 6*s.* per dozen.—W. POTTS, Neithrop House, Banbury.

BRAMAH POOTRA FOWLS' EGGS, from the stock that took the first prize in England at Birmingham, in 1851, as a new and distinct breed; they are heavily feathered and vulture hocked 20*s.* per dozen; true white faced Spanish, 10*s.*; speckled Dorking, 6*s.*; white Aylesbury Duck Eggs, 6*s.* per dozen. A few choice Spanish fowls for sale.

WM. TURNER, Drayton, Abingdon, Berks.

TO AMATEURS OF THE HAMBURGH FOWLS.—A few sittings of Eggs of each class of the Hamburgh Fowls, viz.:—Gold and Silver Pencilled, Gold and Silver Spangled, and Black, to be disposed of in the spring, from birds which have taken thirty prizes at most of the principal Shows during the past season. Eggs will be supplied according to the dates of the orders received. Also, Eggs of Prize Game Fowls and Aylesbury and Rouen Ducks.—Apply to the Feeder, Mr. ROBERT HUGGINS, Beighton Rectory, Acle, Norfolk.

BRAHMA POOTRA FOWLS.

TO BE SOLD, a few Sittings of EGGS of this breed (according to priority of application), from the prize and selected birds of a gentleman—Brahmas of whose breeding have, during the past year, taken prizes at the following important Poultry Shows: the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Winchester, Norwich, and Manchester.—W. C. G., Post-office, Sandbach, Cheshire.

PEA-FOWLS.

TO BE SOLD, a handsome PEACOCK and PEAHEN; the cock four and the hen three years old, price 3*l.* 10*s.* If a purchaser required two Pea-hens, an additional one could be parted with, price 30*s.* The foregoing birds are in full plumage.—Apply, by post, to A. B., Post Office, Wellington, Somerset.

TO BE SOLD, A SUBSTANTIAL POULTRY HOUSE, 12 feet by 4 feet; House 4 feet square and 6 feet high, with covered Run for Fowls, 8 feet long. Price 4*l.*, complete, with Perches, Ladder, and Nest Boxes. Drawings of several Garden Summer Houses from 50*s.* each. Small House, 6 feet square, with door and windows, neat-shaped, 5*l.* All are portable, and can be erected by any ordinary labourer.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

N.B.—Maker of Iron and Wood Houses for Emigrants; 21 Drawings sent free.

GREENHOUSE.

TO BE SOLD.—15 feet by 9, with Stage and Flue complete. Price moderate. For particulars apply to Y. Z., 10, Highbury Park, London.

A GOOD HIT FOR A YOUNG BEGINNER.

TO BE SOLD, THREE GREENHOUSES, and Plants to be taken at a Valuation or Private Contract, with sundry other useful articles—Frames, a Pit, a quantity of Stocks, Tools, Mould, Manure, with House, and Fixtures. 28*l.* a year, with three years' agreement.—For further particulars apply at 6, Alpha Road, Regent's Park.

TO NURSERYMEN, FLORISTS, ETC.

TO BE SOLD, and may be entered upon immediately, at a fair valuation or by private contract, a most eligible and old-established NURSERY, of nearly ten acres, well stocked, situate in a large town in the centre of England, close to the London and North-Western Railway, convenient for railway transit to all parts of the kingdom; and to a person of good capital disposed to carry it well out, presents an opportunity rarely to be met with. The entrance grounds have recently been laid out, and are most pleasantly situated. The greenhouses, pits, and frames (well stocked with Camellias, Geraniums, &c.), with commodious potting and other sheds, are of recent erection, and have been arranged with strict attention to usefulness and convenience. There is an excellent supply of water from cisterns in each house, supplied from the roof, and a fine pond in the centre of the grounds with an ornamental fountain. There is a handsome seed shop at the entrance, well fitted up, also a warehouse and counting-house attached. The purchaser would be required to pay half the amount on entrance, and give satisfactory security for the remainder in six months.—For particulars apply to Mr. J. OGDEN, Nurseryman and Seedsman, Coventry.

Sales by Auction.

EALING PARK.

MRS. LAWRENCE'S STOVE AND GREENHOUSE PLANTS, AZALEAS, AND HEATHS, THE MOST IMPORTANT AND VALUABLE COLLECTION EVER OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is honoured with instructions (in consequence of the ill-health of Mrs. Lawrence) to Sell by Auction, at the Gardens, Ealing Park, on WEDNESDAY, 26th April, and following days, at 1 o'clock precisely, this unrivalled Collection of Magnificent Specimen STOVE AND GREENHOUSE PLANTS, AZALEAS and HEATHS, in all about 500. The Plants are so well known that it is sufficient to say they are the finest and best cultivated in the world, in admirable health, well set with bloom buds, and offering to Gentlemen and Nurserymen an opportunity of possessing specimens of transcendent splendour for exhibition at the forthcoming shows.—May be viewed two days before the Sale, by Catalogues only, to be had (2*s.* 6*d.* each, returnable to purchasers) of Mr. J. C. STEVENS, 38, King Street, Covent Garden. It is probable that for the purpose of enlarging the Flower Garden, 10 out of Mrs. Lawrence's 26 Plant Houses may be offered for Sale. They consist of two long Ranges, a Centre, &c., with 2500 feet of Pipe, four Boilers, slate and wood Stage, Stone Pavement, &c., which may be viewed any time before the Sale, by applying to the head gardener at Ealing Park.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, April 13th, at 12 o'clock, a first-rate collection of Carnations, Picotees, and Pinks, a fine assortment of Fuchsias, Verbenas, Dahlias in dry roots, American Plants, &c. On view the morning of sale. Catalogues may be had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT SALE OF YOUNG SPECIMEN HEATHS, GREENHOUSE PLANTS, AND ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions by Mr. Epps, of the Bower Nurseries, Maidstone, to Sell by Auction, on TUESDAY, April 25th, at 12 o'clock, at the Auction Mart, Bartholomew Lane, nearly 300 Splendid Young Specimen Heaths, Greenhouse Plants, and Orchids. The Ericas consist of Obbatas, Hartnellis, Tricolors, Massoni, Ampullacea, vars. ferruginea jasminoides, vars. Cavendishi, Ventricosas, &c., &c.; the Orchids, Cattleya, vars. Dendrobiums, Oncidiums, Brassias, Maxillarias, Cœlogyne, Vandas, &c. It is needless to state that the Ericas grown by Mr. E. are the finest and most healthy plants known; and on no occasion has there been submitted to the public so splendid a collection; they are calculated to suit all purchasers, as they consist of specimens in 8 to 20 inch pots, the bulk in 11 inch pots. The Orchids are choice and valuable species.—May be viewed the morning of Sale, Catalogues may be obtained (6*d.* each, returnable to purchasers), of Mr. Epps, Bower Nurseries, Maidstone; the principal Seedsmen in London; at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. J. WILLMER will sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY, April 12th, at 12 o'clock, a fine collection of CARNATIONS and PICOTEES, including a fine selection of yellows; also Pinks, Dahlias, Climbing Roses, Auriculas, Pœonies, Hollyhocks, &c.—May be viewed the morning of Sale, and Catalogues had at the Mart, and of the Auctioneer, Sunbury, Middlesex.

BABRAHAM HALL, CAMBRIDGESHIRE.

MR. CHARLES WISBEY will Sell by Auction, on THURSDAY, April 13, at 11 o'clock, on the Premises, by direction of the representatives of the late Robert Jones Adeane, Esq., a valuable and very choice collection of STOVE, GREENHOUSE, and other PLANTS, comprising fine specimen Plants of Indian Azaleas, Ericas, Epacris, &c. Also, in great variety, the following tribes:—Camellia, Cytisus, Acacia, Correa, Stove Ferns, Fuchsia, Cactus, Cape and other Geraniums, Specimen Chrysanthemums, Alpines, Hybrid Rhododendrons, &c., all of the newest and most choice description; also 80 Succession Pine Plants.—On view the day preceding and on the morning of sale, and Catalogues had at GARRAWAY'S Coffee House, Cornhill, London; and of CHARLES WISBEY, Auctioneer, Valuer, and Estate Agent Trinity Street, Cambridge.

This day is published, in Two Volumes, demy 8vo, price 25*s.*,

By a PHYSICIAN.

Also, by the same Author, price 2*s.* 6*d.*; by post, 3*s.* 6*d.*,

A MEDICAL TREATISE ON NERVOUS DEBILITY AND CONSTITUTIONAL WEAKNESS, with Practical Observations, illustrated with Anatomical Plates, on Health and Disease.

This work, emanating from a qualified Member of the medical profession, the result of many years' practical experience, is addressed to the numerous classes of persons who suffer from the various disorders acquired in early life. In its pages will be found the causes which lead to their occurrence, the symptoms which indicate their presence, and the means to be adopted for their removal.

London: JAMES GILBERT, 49, Paternoster Row; HANNAY, 63, Oxford Street, MANN, 39, Cornhill; and all Booksellers.

Now ready, considerably enlarged, price 5s. 6d., the Third Edition of

RURAL CHEMISTRY:

AN ELEMENTARY INTRODUCTION TO THE STUDY OF THE SCIENCE IN ITS RELATION TO AGRICULTURE.

BY EDWARD SOLLY, F.R.S. F.L.S. F.G.S.

HONORARY MEMBER OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND, PROFESSOR OF CHEMISTRY TO THE HORTICULTURAL SOCIETY OF LONDON; LECTURER ON CHEMISTRY IN THE HONOURABLE EAST INDIA COMPANY'S MILITARY SEMINARY AT ADDISCOMBE, &c. &c.

PREFACE TO THE THIRD EDITION.

"In accordance with numerous suggestions, very considerable additions have been made to this little book, in preparing it for a new edition; several important practical matters, not treated of in any former editions, having been introduced. Brief descriptions of the more important of the domestic arts, such as Wine and Vinegar Making, Brewing, the Manufacture of Spirits, Baking, Cheese-making, Cookery, &c., have been added, together with some account of the Scientific Principles involved in those arts. Numerous recent analyses of agricultural crops have likewise been given, and the whole has been carefully revised and corrected."

Published by J. MATTHEWS, at the Office of the *Gardeners' Chronicle*, 5, Upper Wellington Street, Covent Garden, London; and may be had by order of any Bookseller.

4, GREAT RUSSELL STREET, COVENT GARDEN, 1854.

JOHN KERNAN,

IN OFFERING TO HIS FRIENDS AND THE PUBLIC THE ANNEXED

LIST OF VEGETABLE AND FLOWER SEEDS,

WHICH INCLUDES EVERY NOVELTY INTRODUCED UP TO THE PRESENT SEASON,

BEGS TO ASSURE HIS CUSTOMERS THAT HE HAS SPARED NO TROUBLE IN SECURING EVERY ARTICLE AS GOOD AS IT COULD POSSIBLY BE PROCURED.

☞ *From the unfavourable weather in the late harvest, many articles are in short supply.*

PEAS.

	Per qt.—s.	d.
Early Emperor	1	0
Shilling's new early Grotto	1	0
Bishop's new long-podded	1	0
Fairbeard's Champion of England	1	0
Fairbeard's Surprize ...	1	0
British Queen	1	0
Knight's dwarf green and tall	1	0
Scimetar	0	9
Woodford or Nonsuch ...	1	0
Victoria Marrow	1	0
Dwarf green Mammoth ...	1	6
Tall white do. ...	1	6
With all other varieties worth cultivating.		

BEANS.

	Per qt.	
Early Mazagan	0	6
Sword Longpod	0	8
Hangdown	0	6
Taylor's Windsor ...	0	8
Johnson's Wonderful ...	0	8
Green Genoa	0	8
Dwarf French, of sorts ...	1	0
Scarlet Runners	1	0
Painted Lady do.... ...	1	0

	Per oz.	
Beet, fine London Red ...	0	6
„ Silver, or Seakale ...	0	6
„ Whyte's black ...	0	6
Borecole, new heading, per paper	0	6
„ red and white, variegated, for garnishing	0	6
„ dwarf curled, per oz.	0	6
Brussels Sprouts (foreign seed, fine), per oz.	0	9
„ English do.	0	6
Kohl Rabi, per paper ...	0	6
Savoy, green curled, per oz.	0	6

BROCCOLI.

	Per oz.	
Myatt's Early Purple Cape	1	0
Miller's Dwarf	1	0
Chappell's Cream... ...	1	0

Willcove White, late ...	1	0
Grange's Early White—from the original raiser	1	0
Invisible White	1	0
Purple Sprouting	1	0
Walcheren	1	0
Imperial Winter	1	0
Dwarf Siberian	1	0
Purple Syrian	1	0

CABBAGE.

	Per oz.	
Nonpareil	0	6
Shilling's New Queen, fine	0	6
Atkin's Matchless ...	0	6
Early Venus	0	6
Knight's Early Dwarf ...	0	6
Early York	0	6
Large York	0	6
Early Battersea	0	6
True Cornish	0	6
Couve Tronchuda, per paper	0	6
Red Dutch	0	6
And all other kinds in cultivation.		

CARROT.

	Per oz.	
Early Scarlet Horn ...	0	3
Long Orange	0	3
Fine Surrey	0	3
Altringham, per lb. ...	1	6
White (for Agriculture), per lb.	1	6
Parsnip, Hollow-crown, per oz.	0	3

CAULIFLOWER.

	Per oz.	
Mercer's fine Pearly ...	1	6
London Particular ...	1	6
Large Asiatic	1	6
Walcheren	1	6

PARSLEY.

	Per bush.	
Plain, for sheepwalks and early lambs ...	14	0
Extra curled, per oz. ...	0	3

CRESS.

	s.	d.
Plain, per pint	0	9
Curled	1	0
American, per oz. ...	0	3
Water, per paper	0	6
Mustard, per pint	0	9

CELERY.

	Per oz.	
Cole's Superb Red ...	0	6
Seymour's Superb White „ Superb Red ..	0	6
New Rose, solid	0	6
New Giant	0	6

CUCUMBER.

	Per paper.	
Victory of Bath	0	6
Acme of Perfection ...	1	0
Syon House	1	0
Weedon's Free Bearer ...	0	6
Early Frame	0	3
Kerrison's	1	0
Walker's Rambler ...	0	6
Windsor Prize	0	6
Early Handglass	0	3
Early Ridge	0	3

MELONS.

True Syon House... ...	0	6
Snow's Hybrid Green-flesh	0	6
Beechwood	0	6
And all the better sorts grown for this market.		

ENDIVE.

New Imperial, per packet	0	6
Batavian, per oz.... ...	0	6
Green curled	0	6
White curled	0	6
Herbs, all the kinds, p. pkt.	0	6

LETTUCE.

Brighton Cos, per oz. ...	1	6
Imperial Cos	1	6
Victoria Cabbage	1	6
Green Paris Cos	1	6
White Summer Cabbage	1	6
Fine London White Cos	1	6
Paris Cos	1	6
Ady's Cos	1	6
Drumhead	1	6
Bath Cos, and others ...	1	6

ONION.

	Per oz.	
James's Long Keeping ...	0	9
Fine White Spanish ...	0	9
Globe	0	9
Strasburgh...	0	9
Deptford	0	9
Silver-skin...	0	9
Tripoli	0	9
Blood-red	0	9
Two-bladed, for pickling	0	9

RADISH.

	Per oz.	
New Scarlet Olive-shaped, a delicious new variety	0	3
New Rose	0	3
Early Frame, per pint ...	1	6
Long Scarlet	1	6
Red and White Turnip ...	1	6
Black Spanish, per oz. ...	0	3

SPINACH.

New Flanders, per pint ...	0	6
Round, or Summer ...	0	6
Lettuce-leaved (new) ...	0	6
New Zealand, per oz. ...	0	3

TURNIPS.

	Per oz.	
Early Snowball	0	3
Red American Stone ...	0	3
Teltow, for stewing ...	0	3
Early Dutch	0	3
Yellow Maltese ... ... „ Stone	0	3
Early Snowball, per lb. ...	2	0
Early Dutch (earliest), true imported	2	0

AGRICULTURAL TURNIPS.

	Per lb.—	
Yellow Bullock	1	0
Skirving's Swede... ...	1	6
Laing's ditto	1	6
Ashcroft ditto	1	6
Dale's Hybrid	1	0
Red Round...	1	0
White Round	1	0
White Globe	1	0
Oxheart	1	0

	per lb.	
Drumhead Cabbage ...	1	6
Thousand Headed ...	1	6

Furze, per lb., 1s. Broom, 1s.
Coarse Grasses for Game Covers, 8s. per bushel.
Yellow Globe and Long Red Mangold Wurzel, per lb., 1s.
White Silesian or Sugar Beet, per lb., 1s.
Chevalier Barley; Hopetoun, Tartarian, Sandy, and other Oats.
Flax, from Riga seed, one year grown in this country.
A fine collection of all the best Permanent Grasses (hand picked) separate or mixed. If mixed, per bushel, 8s.
Sweet Vernal, the earliest and most suitable Grass for early Lambs, 2s. per lb.
White, 1s. 3d., and Red Clover, 1s.; Lucerne, 1s.; and Trefoil, 6d.
Kohl Rabi, for Agriculture, per lb., 2s.
Italian Rye-grass. Spring and Winter Tares.
A few of the very finest Grasses for Lawns, per lb., 1s. 6d.
Myatt's fine new Strawberries.
Asparagus plants, according to age, per 100, 2s. 6d. to 5s.
Seakale plants, according to age, per 100, 5s.; do. for forcing, 10s.
Dulley's Early Scarlet Admirable Rhubarb, per root, 1s.
Myatt's Victoria do. (the largest in cultivation), 1s.
Mushroom Spawn, per bushel, 5s.
Cornwell's Victoria Raspberry, per dozen, 2s. 6d.
All the fine new Raspberries, 2s. 6d. to 3s. per dozen.
Seeds of all the new Strawberries, Raspberries, Gooseberries, and Currants, per paper, 6d.: with Tree Seeds recommended to Emigrants.

POTATOES.

Per bushel.—s.	d.	Per bushel.— s.	d.
Soden's Early Oxford ... 10	0	Walnut-leaved Kidney... 10	0
Barnard's Early Frame 10	0	Ash-leaved Kidney ... 10	0
Shilling's Early Prolific 10	0	Forty-fold... 6	0
Kirke's True Ash-leaved Kidney 10	0	Early Hen's Nest ... 6	0
		Early Shaw 6	0
		Prince Regent's 6	0

And many other most productive late kinds; also seed saved from the best varieties, 6d. per packet.
Garlic, per lb., 8d. Shallots, per lb., 8d.
Budding and Pruning Knives.
Russia Mats, 2s. each. Cuba Bass, per lb., 2s.
Buckwheat, Indian Corn, Rape, Hemp, &c., for Aviaries.
The trade supplied on moderate terms, with every article true to its kind. Catalogues may be had on application.

FLOWER SEEDS.

The following are the most recent introduced Flower Seeds:—Per packet, 1s.

Abronia umbellata
Ageratum albiflora
Calliopsis marmorata
Collinsia Bartsiæfolia
Dianthus Garneriana
Gaura Lindhemani
Linum grandiflorum
„ rubrum verum
Limnanthes rosea
Lupinus monogynia
Lobelia ramosus alba
Lobelia rubra
Lophospermum Jacksoni
Mimulus cæruleus
Nolana grandiflora alba
Œnothera acaulis
Perilla nankinensis
Salpiglossis, scarlet
Saponaria multiflora
Thunbergia Bakeri (white)
Morina elegans

Asters, 24 distinct German varieties, in sealed packets, suitable for exhibition, the collection, 8s.
A mixture, including all the colours of the above, per paper, 6d.
Do. in 12 distinct colours, the collection, 4s.
A mixture of the best varieties of late Asters, 6d.
Superb German and Prussian Stocks, 24 distinct varieties, or exhibition, the collection, 8s.
12 varieties of do., distinct in colours, 4s.
12 autumn flowering do., in distinct colours, 4s.
A mixture of all the finest varieties of Ten-week, per paper, 6d.
12 varieties Brompton Stocks, 4s.
A mixture of Brompton do., per packet, 6d.
12 named varieties of Hollyhocks, 3s.
S named varieties of Marvel of Peru, 2s. 6d., fine, for the front of Shrubberies.

Ornamental Trees and Shrubs of all descriptions.
Cedrus Deodara, Cryptomeria japonica, Taxodium sempervirens, 2s. 6d. to 10s. 6d. each; all the new Pinus.
Named Double Anemones and Ranunculuses: Gladiolus Brenchleyensis and gandavensis; Tigridia pavonia and conchiflora, with many other flowering Bulbs, and Herbaceous Plants, which may be planted out till the middle of May.
Carnations, Picotees, and Pinks, per pair, from 1s. to 3s. 6d.
All the better named Heartsease from 6s. to 30s. per dozen.
Fine named Dahlias, per dozen, 12s.
„ Chrysanthemums, new kinds, 12s.
Standard Dwarf and Climbing Roses, 1s. to 2s. 6d. each.
Rivers' Miniature Fruit Garden, with directions for culture and root-pruning, 2s. Rivers' Orchard House, 2s.
Rivers' new edition of the "Rose Amateur's Guide," 6s.
Rivers' new Fruit Catalogue, 6d. [distribute to cottagers.
Paxton's "Cottage Calendar," 3d., which ladies and gentlemen should
Collections of 24 Annuals, mixed, recommended by Dr. Lindley as suitable for Shrubberies, 5s. [on the most liberal terms.
Seeds for distribution by Gentlemen to their Tenants and Cottagers
24 papers of Hardy Annuals, 5s.
Seeds selected and carefully packed for Australia, North and South America, India, and New Zealand, in the most secure way to arrive safe at any of the above places.

Ladies and Gentlemen relying upon the judgment and experience of JOHN KERNAN, instead of being supplied (as is often the case) with what is neither useful nor ornamental, may depend upon having a selection of the most useful and indispensable Vegetables to any amount named, by the parties forwarding him their orders. The same economy will be observed in the choice of Flower Seeds. J. K. feels it almost needless to observe that the liberality of discount will be with the amount.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, APRIL 8, 1854.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

In accordance with the wishes of Farmers, Millers, and others interested in the Corn Trade, an Edition is published in time for post every Monday afternoon, containing a Full Report of the Mark Lane and Smithfield Markets of the day.

In consequence of the Advertisement Duty having been taken off by the Government, the customary charges for Advertisements in *The Gardeners' Chronicle and Agricultural Gazette* have been reduced.

Advertisements appear in both Editions without extra charge.

Very superior assortment of Imported GERMAN FLOWER-SEEDS, NEW ANNUALS, &c., of which separate Lists may be had.—Edinburgh: Edgehill Nursery, and 145, Princes Street.

NEW ROSES FOR 1854.

BENJAMIN R. CANT has now ready for sale, strong plants in pots of all the NEW ROSES, some of which have never before been offered to the public, descriptive Catalogues of which can be had on application.

St. John's Street Nursery, Colchester.

PERMANENT PASTURE.

R. H. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his Mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., to lay down Land to Permanent Pasture, at 25*s*. per acre, allowing 3 bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

E. SPARY respectfully announces that he has commenced cutting HOTHOUSE GRAPES in fine condition, and will have a constant supply through the year.

His New Dahlias, Ariel and Glory, with other first-rate sorts, will be ready, in fine plants, on the 1st of May. Catalogues of which, including a variety of Plants ornamental to Greenhouses Drawing-rooms, and Flower Gardens, may be had on application Vines, Seeds, &c.—Queen's Graperies, and Western Road, Brighton

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is as delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL & CO., who will forward per post free (on receipt of postage stamps) packets containing six Seeds, 1*s*.; 18 Seeds, 2*s*. 6*d*.

This Advertisement will not be repeated this season.

Royal Nursery, Great Yarmouth.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. Corbett's Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent also, just arrived very moist and open Parmesan Cheeses.

"WELLINGTONIA GIGANTEA."

MESSRS. VEITCH, of Exeter and Chelsea, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant ... 2 guineas	For 8 Plants ... 10 guineas
For 4 Plants ... 6 guineas	For 12 Plants ... 12 guineas

And all orders will be executed strictly in the rotation in which they are received.—April 15.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7*s*. 6*d*. each, of Messrs. Veitch & Son, Exeter, and Mr. James Veitch, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—April 15.

MORTON'S YELLOW GLOBE MANGOLD WURZEL, *saved by Thomas Bennett, Esq., Gloucester, from the Stock originally grown by J. C. Morton, Esq., the Editor of the Agricultural Gazette.*

Seed of this most excellent variety can now be obtained from William E. Rendle & Co., Seed Merchants, Plymouth, who have purchased the whole of the Stock.

NEW ALSIKE CLOVER, Price Ten Guineas per cwt., or in small quantities at 2*s*. per lb., may be had on application to Mr. H. Raynbird, Basingstoke, Hants. Also, New Home-grown ITALIAN RYE-GRASS, of good and genuine Stock, at 30*s*. to 35*s*. per quarter.

BALSAM SEED.—Mr. Glenny has none but mixtures left, but they contain all the varieties; 60 seeds for 13 stamps.

DAHLIA SEED.—A few sealed packets of 100 seeds from 12 first-rate flowers, grown by themselves, 30 stamps. Mr. Glenny engages to procure all the subjects recommended in his Almanac, if they are to be had at all; letters only attended to.—420, Strand.

ROBT. DEBRON has a fine stock of SEEDLING PETUNIAS; the seed was saved from a very fine collection, carefully impregnated. The Plants are established in separate pots. May be had at 6*s*. per dozen, or three dozen for 15*s*., with Plants to compensate for carriage—hamper included. Also nice Plants from mixed impregnated seeds, 3*s*. per dozen.

Ely Nurseries, Ely, Cambridgeshire.

FLOWER SEEDS, for present sowing, sent post free, at the annexed prices: Antirrhinum, from 50 fine varieties, 6*d*.; Carnation, fine, 1*s*.; Auricula, fine, 1*s*.; Double Daisy, fine, 6*d*.; Hollyhock, extra fine, 6*d*.; Gloxinia, extra fine, 1*s*.; Mimulus, fine, 6*d*.; Petunia, fine, 6*d*.; Verbena, extra fine, 1*s*.; 100 fine varieties of hardy annuals, 5*s*.; 50 ditto, 3*s*.; 12 ditto, 1*s*.; the following at 3*d*. each; Aquilegia, Digitalis, Potentilla, Polyanthus, Sweet William, and Phlox Drummondi. Catalogues of seeds sent on application for one stamp.—Wm. Knight, Florist, 67, High Street, Battle, Sussex.

CAPE HEATHS AND NEW AZALEAS.

W. J. EPPS begs to call attention to his extensive and rare Collections of Heaths and Azaleas, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c. AZALEAS—Prince Albert, Gledstanesi, Excelsa, Murrayana, Alba magna, Duke of Devonshire, Holderi, Toilette de Flora, Glory of Sunning Hill, Symmetry, Splendens, Ignescens, &c., &c., 9s., 12s., 18s., and 21s. per dozen; 5l. per 100 varieties, carriage paid to London. All the new Stove and Greenhouse Plants, Fuchsias, Verbenas, and Roses, equally moderate. Catalogues of the above sent on application.—Nurseries, Maidstone and Ashford.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer: and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21s.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gauffred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21s.

MESSRS. J. AND H. BROWN offer to the Nobility and Gentry the following CHOICE SELECTED PLANTS, &c., which they will forward to any part of the Kingdom, and their new descriptive Catalogue of Plants and Seeds by post.

		s.	d.

Remittances are requested with orders from unknown correspondents. Post-office Orders to be made payable to BASS & BROWN, or to STEPHEN BROWN.—The Autumn and Spring Catalogues supplied free by post for three penny stamps each, the cost of which may be deducted from orders sent.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk. ESTABLISHED ABOUT HALF A CENTURY.

EXTRACT OF A LETTER FROM DR. LINDLEY:—

"Messrs. SUTTON,—*We have already made a trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(*Signed*) "JOHN LINDLEY.

"*Horticultural Society, 21, Regent Street, London, Nov. 9, 1853.*"

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1s. 3d. per lb., 3s. per gallon, or 21s. per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, in forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.

SUTTON'S GRASS SEEDS *for forming Permanent Pasture, 24s. to 30s. per acre;* SUTTON'S RENOVATING MIXTURE *for Improving Old Pastures, 1s. per lb.*

JOHN SUTTON AND SONS, Seed Growers, Reading, Berks.

Natural Grasses, of sorts, at very moderate prices; Flower, Tree, and Kitchen Garden Seeds; Boiling and Split Peas, Bird Seeds, Double Superfine Mustard; Garden and Agricultural Implements, Saynor's Pruning Knives: Archangel Mats, Cuba Bast, Mushroom Spawn; fine Ornamental Vases, all sizes; Fruit, Forest, Ornamental Trees and Shrubs, Greenhouse, Herbaceous, and Alpine Plants, &c.

TURNIP SEEDS.

THE SUBSCRIBERS are now selling, from a large and carefully selected Stock, the following varieties of TURNIP SEEDS. Prices are moderate.

SWEDES.—Skirving's Purple Top. (*On strong clays or other heavy soils no variety of Swede will produce so bulky a crop as this.*)

„ Lothian Purple Top. (*An established well known sort, rounder shape than Skirving's, and does not grow so much to "long necks."*)

„ Hardy Green Crop. (*There is nothing to equal this variety for* mellow *and* peaty *soils. It is less liable to* ROT *than any other Swede, and it possesses excellent feeding properties, being crisp, juicy, and sweet.*)

„ Laing's Improved. (*A beautiful shaped bulb, and on rich loamy soil yields a great crop, but is not equal in hardiness to any of the preceding.*)

YELLOWS.—Green Top, or Aberdeen Bullock—Improved Stock. (*It is questionable if there be a better Yellow Turnip than this, provided it be grown from a properly selected stock; it has, however, above all others, in too many instances, disappointed the farmer in consequence of the spurious character it has assumed through a bad stock of seed, which, instead of giving a heavy crop of large well shaped bulbs, with moderate sized tops, produce only stunted small bulbs with a profusion of large coarse tops.*)

„ Improved Purple Top Aberdeen—Skirving's variety. (*A very superior sort, yielding a heavy crop, but is not considered equal in hardiness to the preceding.*)

„ Dale's Hybrid. (*Yields a very heavy crop, and is a first-rate kind for early winter consumption. From the bulbs growing considerably above ground, it is well adapted for sheep-feeding.*)

„ Improved Early. (*A superior sort; bulbs large and finely shaped, with small top and tap root. Unless wanted for early use it should not be sown till the end of June, and sowing may be continued up to the middle of July, with the certainty of having a good crop.*)

WHITES.—Large Globe,

„ „ Green Globe Imperial. (*A superior hardy sort.*)

„ „ Red Globe.

Priced Lists of the above, with every other description of Farm Seeds, may be had on application, post free.

All parcels of Seeds are delivered carriage free to the principal Railway Stations and Shipping Ports throughout the kingdom.

W. DRUMMOND & SONS, Seedsmen, Stirling, N. B.

NEW FUCHSIAS OF 1854, raised by Mr. Batten, who sent out Fuchsia Clapton Hero, which gave universal satisfaction.

Oxalis, new species from Chili, very large, bright rose-coloured flowers, and an abundant bloomer, 30s. per dozen.

Tropæolum azureum, large sound roots, 30s. per dozen.

„ tricolorum „ „ 15s. „

„ brachyceras „ „ 15s. „

The usual discount to the Trade.

HUGH LOW AND CO., Clapton Nursery, London.

FIRST-RATE NEW DAHLIAS, FUCHSIAS, VERBENAS, PETUNIAS, GERANIUMS, CINERARIAS, PANSIES, BEDDING PLANTS, ETC., AT VERY REDUCED PRICES.

WILLIAM RUMLEY AND SONS are now sending out the following, in fine strong plants, hamper included, or free by post, viz.:

DAHLIAS.—The following best new varieties of 1853, 15s. per dozen, six for 8s., or 1s. 6d. each: Comtesse de Chambord, British Queen, Grand Duke, Ma Beauté, Miguel, Madame Portier, Mr. Souchet, Plantagenet, Queen Victoria, Sir John Franklin, Mr. Duglerc, Miss Caroline, and Victoire, &c.

Purchaser's selection from the following extra fine show varieties, 9s. per dozen; our selection, 6s. to 9s. 6d. per dozen. Alert, Annie Salter, Beauty of Versailles, Black Diamond, Edmund Foster, Defiance, Dr. Frampton, Evening Star, Rose of England, Sir F. Thesiger, Sir R. Whittington, Toison Orange, Red Gauntlet, Jaune de Passy, Barmaid, Lady E. Cathcart, Sylph, Malvina, Queen of Beauties, Louis de France, Douglas Jerrold, Queen of Scotland, &c.

FANCY DAHLIAS.—The following choice varieties, 9s. per dozen, or six for 5s.: Claude, Laura Lavington, Reine des Fleurs, Duchess of Sutherland, Picturata, Uncle Tom, Lilliput, Von Bagreuth, Kossuth, Miss Bathurst, Vulcan, Forget-me-Not, Gaiety, Miss Blackmore, &c.

FUCHSIAS.—The following best new varieties of 1853, 9s. per dozen, or six for 5s., viz.: Brilliant, Dr. Lindley, Duchess of Lancaster, England's Glory, Glory (Banks'), Incomparable, King Charming, Lady E. Cavendish, Lady Franklin, Model, Mrs. Patterson, Perfection, Premier, Sir J. Paxton, Vauban, Vandyke, Vesta, &c.

VERBENAS.—Purchaser's selection from the following best new varieties of 1853, 6s. per dozen; our selection, 5s. per dozen: Brilliant de Vaise, Danecroft Beauty, Elizabeth, Fulgorie, Garland, Glory, Grandeur Lyonnaise, Lady Franklin, Madame Boucharlat, Madame Ivery, Madame Lemonier, Madame Panmary, Madame Rougier, Monsieur Dervint, Mrs. Kirkpatrick, Orestes, Purity, Princesse Marianne, &c.

PETUNIAS.—The following best varieties of 1853, 6s. per dozen: Brilliant, Commander, Delicata, Eastern Beauty, Eva, Fairy Ring, Goliah, Lavinia, Lady Cullum, Lilac Perfection, Ponceau, Queen of Roses, Uncle Tom, Venosa Perfecta, &c.

GERANIUMS.—Choice show and fancy varieties, 9s. to 18s. per dozen.

CINERARIAS.—The best new varieties of 1853, 9s. to 12s. per dozen; good show varieties, 6s. per dozen.

PANSIES.—Extra fine varieties, 4s. to 7s. 6d. per dozen.

CHRYSANTHEMUMS.—The very best, large-flowered, and Lilliputian varieties, 4s. to 6s. per dozen.

BEDDING PLANTS.—Choice varieties, 3s. to 6s. per dozen.

The above will be forwarded immediately on receipt of a Post-office Order, payable at Richmond.

All orders of 1l. and upwards carriage free; for particulars see our General Descriptive Spring Catalogue of the above, which may be had on application.—Gilling, near Richmond, Yorkshire.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6 to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.

„ Goveniana, 2 to 3 and 4 feet.

„ Funebris, 2 and 3 feet.

„ thyoides variegata, 2, 3, and 4 feet.

The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.

„ Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.

„ repandus, 3, 4, 5, to 8 feet.

„ Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns, and, except at Elvaston, unequalled.

„ Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.

„ Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.

„ Gold striped, 1, 2, and 3 feet.

„ do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.

„ elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.

„ Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.

„ insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.

„ cembra, 3, 4, to 6 feet.

„ Canadensis (Hemlock Spruce), 3, 4, and 6 feet.

„ morinda, 3, 4, and 6 feet.

„ Menziesi, 3, 4, 6, and 8 feet.

„ cephalonica, 3 to 4 feet.

„ Pinsapo, large and handsome, 3 and 4 feet.

„ Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.

„ nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.

„ Weareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.

„ aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

EUGENIA OR MYRTUS UGNI.

MESSRS. VEITCH AND SON, of Exeter, and the Exotic Nursery, Chelsea, have much pleasure in offering to the Public the above beautiful evergreen flowering shrub of THEIR OWN introduction, from Patagonia, through their collector, Mr. Wm. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by its Strawberry-flavoured red berries, eaten in Chili as dessert. It is a plant of easy culture, flowering in a very small state, when not above 6 inches high, and is well adapted for pot culture. It is figured by Sir Wm. Hooker in Curtis's "Botanical Magazine" for January, 1852.

Strong blooming plants, in 48-sized pots, 21*s.* each.
Second size do. in 60-sized pots, 15*s.* each.

With the usual discount to the Trade, and one over on either class when three are taken.—Exeter, April 15.

BEAUTIFUL NEW BEDDING PLANT.
MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s.* per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

BLOOMFIELD NURSERY, EDMONTON.

HENRY LEGGE begs to inform the Trade that he intends sending out, in May next, the under-named DAHLIAS, which will be found to surpass all in their respective Classes, and to be the most constant and free blooming ever sent out.

MIDDLESEX HERO.—Rose, full size, superb form and petal, high centre, free and constant; 10*s.* 6*d.* per plant.

SCARLET UNIQUE.—Large scarlet, first-rate form, close high centre, and constant; 10*s.* 6*d.*

MRS. COOPER.—White, tipped with crimson, splendid form, medium size, every bloom fit for exhibition; 10*s.* 6*d.*

SARDANAPALUS.—Black, tipped with white, a complete ball in shape, every bloom fit for show, extra fine fancy; 10*s.* 6*d.*

JOHNNY GILPIN.—Scarlet, tipped with white, this will be found to surpass every other of the colour, a complete gem; 10*s.* 6*d.*

DINAH.—Purple, tipped with white, fine form and petal, free bloomer, and constant; 7*s.* 6*d.*

All the leading Sorts sent out last season at 12*s.* per dozen; older varieties, 4*s.* per dozen. Catalogues can be had.

J. COLE begs respectfully to inform the Floricultural Public that he has two very fine Shrubby Bedding CALCEOLARIAS to offer them, namely, PRINCE OF ORANGE and ERECTUM. The former a dark orange with a large umbel of flowers nearly as large as "Kentish Hero;" the latter an orange with a scarlet tinge, of erect habit, similar to "Viscosissima," with much larger flowers. J. C. flatters himself they will give the greatest satisfaction to all purchasers, being entirely shrubby and free from that coarseness of foliage many of the varieties evince. "Prince of Orange" is of dwarf habit, with small green glossy foliage, and never infested with green-fly, which is a great acquisition in the Calceolaria. J. C. offers them at 5*s.* per plant. The usual discount when three are taken. Flowers of them were submitted to some of the leading London nurserymen, who wished to have plants when sent out. A remittance solicited from unknown correspondents.

Keyfield Nursery, St. Albans, Herts.

CANADIAN SEEDS.

COCKBURN & BROWN, NURSERYMEN, SEEDSMEN, and FLORISTS, Montreal, solicit orders for the seed of Balsam and Spruce Firs, Canadian Larch or Tamasac, Red and White Pine, American Oaks, Sumachs, &c. We particularly refer to the beautiful Hemlock Spruce, any quantity of the seed of which we will undertake to furnish. They can be sent from Montreal either by steam or sailing ship. Samples can be had from Mr. JOHN BROWN, 44, Norfolk Street, Glasgow.—Orders for next Autumn delivery to be sent not later than middle of August. We can furnish all sorts of Canadian Plants.—April 15, 1854.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. It is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London; also of the Advertiser, 57, Queen Street, Hull.

TO DAHLIA GROWERS.—EDWIN HARRISON (PERRY'S), is the most brilliant crimson Dahlia ever raised; build and form of General Fauchier, and more constant than any crimson Dahlia in cultivation. No grower can be without it; as an ornamental plant it has no rival. It has obtained one first-class Certificate and three first Prizes as the best crimson Dahlia, beating all other varieties. Plants in May, 10*s.* 6*d.* each.

ALEXANDER POPE (PERRY'S), is a constant well-formed Dahlia, with very high centre; colour pale lemon. It has obtained one first-class Certificate and two first Prizes as the best yellow or buff Dahlia. The *Gardeners' Chronicle* says—"We like the flower much for its novelty." Plants in May, 7*s.* 6*d.*

Early orders are solicited, as the stock is small.—HENRY POPE, Gib Heath, near Birmingham.

EUGENIA UGNI, a very fine new Myrtaceous plant, recently received by the Subscribers from Mr. Bridges, of Valparaiso, will prove hardy in most parts of Great Britain. It is figured in the January number (1853) of Curtis's "Botanical Magazine," and Sir William Hooker describes it as forming a charming Evergreen Shrub, the flowers and leaves of which are fragrant. This peculiarity alone would be sufficient to ensure its general cultivation, independent of its merits as an ornamental shrub of easy culture. Small established plants 21*s.* each. No discount unless three are ordered.

LAPAGERIA ROSEA; young plants in a growing state, 31*s.* 6*d.* each.

AZALEA INDICA (Beauté de l'Europe).—A new variegated variety of great merit—received a First Class Certificate at the National Floricultural Society, also at the Exhibition of the Society of Horticulture, of the Seine, held at Paris in March, 1853. It is one of the most abundant flowering Azaleas in cultivation. Price 7*s.* 6*d.*

BORONIA DRUMMONDI.—In the style of B. pinnata; colour, beautiful rosy crimson. Unlike other species of this genera, that now offered is of extremely easy culture, elegant habit, and will undoubtedly prove the finest greenhouse plant suitable for exhibition purposes that has been introduced to this country since the Subscribers offered for the first time Pimelea spectabilis. Price 7*s.* 6*d.* each. From the last three Plants usual discount will be allowed to the trade.

HUGH LOW & CO., Clapton Nursery, near London.

FIRST-CLASS NEW VERBENAS, FUCHSIAS, GERANIUMS, ROSES, PANSIES, &c.

CHARLES H. GARDINER offers the undernamed, in strong plants, at the following prices, hamper and packing included.

VERBENA JESSIE, large, white, with purple centre, extra large truss, fine form, good for bedding or exhibition; strong plants, 5*s.* each. Choice and new kinds of 1853, 9*s.* per dozen.

FUCHSIAS.—Selections from the following choice and new kinds, strong plants, 12*s.* per dozen:—Glory, Incomparable, King Charming, Model, Dr. Lindley, England's Glory, Beauty of Clapton, Premier, Commodore, Nil desperandum, Duchess of Lancaster, Ariel, Mrs. Patterson, Perfection, Lady Franklin, Lady Cavendish.

BEDDING GERANIUMS.—Hendersoni, Boule de Neige, White Unique, Lilac ditto, Shrubland Pet, Bagshot Park, Mrs. Rickett's—fine scarlet with white eye, very dark horse-shoe leaf—strong plants, 9*s.* per dozen.

PANSIES.—Choice and best kinds, 9*s.* per dozen.

TEA ROSES.—Strong plants in pots, of the best kinds, 12*s.* per dozen.—Fant Nursery, Maidstone.

CHOICE GERANIUMS.

WILLIAM HUSSEY begs to offer the undernamed GERANIUMS, fine healthy Plants, for 20*s.*, basket and mat included.

Chloe (Hoyle)	Mohanna (Hoyle)
Enchantress (Foster)	Narcissus (Foster)

DAHLIAS, 21*s.* per dozen:—Alice, Attraction, Annie Neville, Annie Salter, Brilliant, Exquisite, Gloire de Paris, Harlequin, Lilac King, Lilliput, Lord Byron, Lord Lyndhurst, Motley, Mrs. James, Queen Victoria, Scarlet King, Sir John Franklin, Wonderful, Zebra.

The following at 9*s.* per dozen:—Bathonia, Beeswing, Beauty of Kent, Box, Caractacus, Captain Warner, Cardinal, Duke of Wellington, General Fauchier, General Negrier, John Edward, Louis de France, Magnificent (Edwards'), Magnificent (Keynes'), Madame Gaubert, Princess Louisa, Queen of England, Queen of Primroses. Older Varieties, 6*s.* per dozen.

Also, AGRICULTURAL AND GARDEN SEEDS of every description.

Price Lists of Plants and Seeds sent post free, on application.

PRIZE MANGOLD WURZEL AND SWEDE SEED.

SUTTON AND SONS have a fine stock of Seeds of the best kinds of Swedes, Mangold Wurzel, Carrot, &c., similar to those they supplied last season, the produce of which gained prizes at all the principal root shows throughout the kingdom.

At the Annual Root Show, held at Basingstoke, Hants, on December 21, 1853, at which 16 prizes were awarded for root crops, 13 were gained with the produce of our seeds; and at the Reading Show, on the 1st of the same month, every prize was awarded to roots grown from our seeds.

A Priced List, with Hints on Cultivation, may be had, post free, in return for one penny stamp.

SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S IMPROVED SWEDE TURNIP.—*The Stock of this excellent Swede has been grown for us this season by R. H. Watson, Esq., Dorsley, near Totnes. It is a most hardy and valuable variety. Price 1s. 6d. per lb. For further particulars and testimonials of its excellence see* "FARMING PRICE CURRENT," to be procured from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

NORTH DEVON EVERGREEN RYE-GRASS.—*This Grass, which is held in great celebrity in the West of England, should be introduced into every mixture —for* PERMANENT PASTURE.

It is a very hardy Grass, and remains evergreen throughout the most severe winter. It forms a fine bottom, and is much liked by cattle. The true sort can be had from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

Price from 5*s.* to 6*s.* per bushel, or 4*d.* per lb.

This Grass can be recommended with the greatest confidence.

SEEDS TO IRELAND.—*Plymouth is admirably situated for supplying our sister country with some English Seeds. The Subscribers can refer to some of the leading families in Ireland, who have for many years obtained the whole of their supplies of Garden and Farm Seeds. Seeds delivered free to many of the Irish ports. See Price Current.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

PAGE AND CO.'S

BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. 4*s.* per gallon, sufficient to make four. For testimonials see back leaf *Gardeners' Chronicle*, March 11, 1854.

GARDEN AND AGRICULTURAL SEEDS, first quality, and lowest market price.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

The Gardeners' Chronicle.

SATURDAY,	— 22	Royal Botanic	3½ P.M.

THE wants of PAPER MAKERS can only be satisfied by the production of more raw material. That material can be as well provided in our own fields as by foreign importation, and we believe as abundantly. Whether, however, we can grow paper materials as cheaply as they may be imported is a question to be answered by no other means than by experiment. Country gentlemen, living near paper mills, are those by whom the experiment should be tried. It cannot cost much; their gardeners are the men to conduct it; and now is the time to set about it.

The problem to solve is, whether it is more profitable to grow an acre of corn, of root crop, or of paper materials?

Paper materials are vegetable fibre. All plants consist largely of this substance, but in some it is more abundant than in others, or more separable, or finer, or of a better colour. Those plants will be best suited for the purpose in question in which it is most abundant, most separable, finest, and whitest.

We are surrounded by suitable plants, but they are not cultivated. Nettles and Mallows in particular are well known to possess the requisite qualities; so does the Spanish Broom, and probably the Common Broom; any of these thrive in poor soil, where better crops cannot be produced.

The common Stinging Nettle is an example of what we mean. Its roots can be procured everywhere; and as it is perennial it will not only keep itself sufficiently clean, but may be cut two or three times a year. The principal cost consists in collecting its roots for planting, rent, &c., of land, and the labour of cutting and preparing. Its fibre is very fine and good; scarcely inferior to hemp, and has been used in Germany in the manufacture of first class paper. Fishing lines and cordage of good quality are also said to have been prepared from it. Wherever anything can grow, there the Nettle is at home; no bad seasons hurt it; no neglect injures it; and it is subject to neither blight nor mildew, nor the ravages of insects.

A larger produce may, no doubt, be had from the Hemp-leaved Nettle (*Urtica cannabina*). This plant does not sting; its stems grow 5—6 feet high, and it is perennial, like the last. But it can only be obtained sparingly in botanic gardens, and therefore is not immediately available.

Mallows are to be had everywhere; and from them a white fibre is procurable in abundance. We do not find that it has been employed in paper-

making, but its fibre is known to have been used for cordage. The best species, we imagine, for a trial would be one of the annual Mallows; either the curled-leaved (*Malva crispa*) or the Zebra Mallow (*M. mauritiana*), seed of both which is easily procurable of the great seed merchants. These are well known to gardeners, because of their being cultivated as ornamental plants; they grow 6—8 feet high, and come quickly to hand. They might be drilled in rows 18 inches apart, and 6 inches asunder in the rows.

As to the common Broom, it is worth ascertaining whether it may not be cut profitably for its fibre. Its near relative, the Spanish Broom (*Spartium junceum*), is reported to yield a very good substance without much trouble. So much of the former is to be found among plantations in poor sandy districts, that there can be no difficulty in procuring enough for a fair trial. It will only be necessary to cut it close in now, so as to force the bushes to produce plenty of young wood, which should, we imagine, be collected for the fibre, as soon as the wood shows the first signs of beginning to ripen.

It is by no means improbable, indeed, that many other neglected plants may be turned to similar account, by enlightened experimentalists; for there is no doubt that we are surrounded by wealth which we cannot recognise, and which never will be appreciated till "common things" are understood as well as useless rarities. In fact, there is now before us a sample of fibrous matter, produced in great abundance near Belmullet in Ireland, for which we have to thank Mr. Billington. He does not say what the plant is from which it was obtained, but he states that it will grow very luxuriantly in cold bleak situations where other crops refuse to thrive, and it seems to us to be very much more easily convertible into paper than white wood of any kind.

If, as we imagine, the object of the cultivator is to obtain the greatest amount of money out of land at the smallest possible expense, we venture to submit the above considerations to our country friends. For ourselves we would as soon grow an acre of Thistles as an acre of Potatoes, if we could obtain as much profit; and this, although, like all other speculations, it belongs at present to what Mr. Justice Maule happily calls the "regions of indistinctness," seems to us a subject extremely well worth careful investigation.

The report of progress in the grounds at Sydenham, which appeared lately in our columns, will have shown how rapidly the gigantic works in the Park and Garden there are approaching completion. To the decoration of the interior we have not hitherto alluded, nor are we prepared even now to say more than that we entertain no doubt that the effect produced within the building will be worthy in all respects of the exterior.

It is, however, to be remembered that while effect is easily given to the open ground by shifting the position of large trees already growing there, it is quite different with the landscape gardening of the interior. For this purpose an abundance of tender plants of considerable growth is absolutely necessary, and they cannot be procured among the nurserymen. The purchase of Loddiges' noble collection, by the directors of the Crystal Palace, almost exhausted the plant market; a few straggling specimens may have been procurable elsewhere, but their presence could scarcely be discovered in so vast a building.

That such plants exist, however, plentifully in private collections, we have no doubt. Almost every body who possesses large conservatories must have specimens either already too large to be confined within them or rapidly becoming so. The usual fate of such plants is destruction, greatly to the regret of those under whose eyes they have been reared for so many years. In the nave of the Crystal Palace they would find already welcome, such good treatment as would ensure their future health, and free space in which to develop their natural magnificence. We therefore venture to suggest that all who possess fine specimens of plants too large to be longer retained in their own conservatories, should hasten to confide them to Sir Joseph Paxton, at Sydenham. Under any circumstances this would be better than destroying them; we have reason to know that they would be gratefully received, and every donor would have the satisfaction of feeling that he too has contributed something to a palace which promises to become the eighth wonder of the world.

Few matters of greater mortification can happen to a gardener, anxious to have everything in its proper season, than the loss of his crop of early Strawberries; and yet it is very possible that the same misfortune, which has happened in part to one of our ablest and most scientific cultivators, may fall to the share even of those who seldom or never fail, where it is possible to use preventives. A crop of Cuthill's Black Prince has been entirely destroyed by a little white mildew, attacking first the leaves, but soon infesting, with increased vigour, the flowers and footstalks, and ultimately inducing very much the same appearances as those which are unhappily too well-known in the case of the shoots and foliage of Vines infested with the Grape mildew. At present, the evil has been confined to one variety of Strawberry—the plants of Keens' Seedling, on the same shelf, being perfectly free. Those, however, may soon be equal sufferers, and the malady may appear, or possibly has already appeared, in other quarters. The main question is, can anything be done by way of prevention? Now, happily, there is no doubt about the nature of the malady. It is induced by a little *Oidium*, resembling closely that of the Vine, but differing in having a constriction at either end of the elliptic spores, so as to give them the same tunlike outline which is observable in the mildew which infests the leaves of different species of Verbascum, *Oidium Balsamii*, Montagne. Their length varies from .0012″ to .0013″.

Since, then, the parasite is so closely allied to that of the Vine, and to the Peach mildew, it is highly probable that the methods, which, if applied sufficiently early, are uniformly successful with the Vine and Peach, will be so in the present case. We should recommend, then, on the very first appearance of any white mealy parasite on the leaves, to syringe the plants thoroughly with a properly diluted solution of lime and sulphur, made according to the *procédé* Grison, which was detailed in this Journal, p. 419, 1852, and we have little doubt that the little enemy will immediately disappear. Should the Vines or Peaches in the house come in for a share of the sprinkling, there will be no fear of their suffering from it, but should any lurking seeds of mildew exist at this early period, they would at once be destroyed before they had done any serious injury. *M. J. B.*

We learn that a work on Orchidaceous plants is about to appear at Brussels, under the name of Pescatorea. It is to be published monthly, in folio parts, each containing four coloured plates, and as many leaves of letter-press. The gentleman whose name it bears, and by whose munificent support the cost of the work is to be partly provided for, possesses the finest collection of Orchids known upon the continent, at his Chateau de la Celle, St. Cloud, near Paris; and he is most richly entitled to the compliment paid him in the title of the work. The editors are to be, in the first place, Mr. Linden, the well-known traveller, now director of the Royal Zoological and Horticultural Garden of Brussels; 2, Mr. Lüddeman, the skilful superintendent of M. Pescatore's hothouses; 3, Prof. Planchon, of Montpellier; and 4, Prof. Reichenbach the younger, to whom, in intimate knowledge of the order no continental botanist even approaches. These favourite plants are now so largely imported by continental growers, M. Pescatore is so extremely rich in fine plants, and Mr. Linden has such abundant materials, both living and preserved in the Herbarium, that we anticipate the appearance of a work of sterling value. The first number is announced for the 1st of June in Brussels.

VEGETABLE PATHOLOGY.—No. XV.

59. In the process of vegetation, of the three component parts of the embryo, viz., root, cotyledon, and primary bud or plumule, the first in order of development is the root. The moisture imbibed by the spongelet induces the growth of the cotyledon*, whether one or more in point of number, and the primary bud, whether more or less distinctly visible at first, is then gradually developed. Its evolution gives rise to the stem, the surface of which is studded with as many buds, whether latent or apparent, as there are leaves. Below the first pair of cotyledons there is occasionally a portion called the neck, which it is difficult to assign correctly either to the root or stem. In general, this neutral portion is reduced to a mere imaginary point. In some cases, as in Beet-root, it is of some practical importance.

60. The primary bud at first consists merely of parenchym, as does the rest of the perfect embryo, in the majority of cases. As the root increases, the tissue of which it is composed assumes distinct forms, and some of the cells soon become vascular. In the same manner as the primary bud expands, and is elongated, the cells in Exogens, between the central and external parts of the tissue, become modified, and gradually give rise to two distinct strata, in immediate contact with each other, one of which increases centripetally, forming the inner bark, and the other centrifugally, forming the wood. The direction of these new cells is vertical, and the whole is connected by interposed wedges consisting of horizontal cells, and proceeding from the central tissue, which is known by the name of pith or medulla. In Endogens, the new vertical tissue is not combined into a distinct cylinder, but scattered about irregularly, and the mode of growth is in consequence modified. Various anomalies also occur in Exogens, which do not, however, demand notice in the present treatise.

61. The observations in the foregoing paragraph apply to perennial stems; but though the distinction is less marked in annual stems, the same law holds good.

62. The stem, then, consists of the external parenchymatous layers of the bark, of the pith, equally composed of parenchymatous cells, the inner bark and wood, and of the connecting horizontal cells, known by the name of medullary rays. The wood is interrupted here and there by bundles of bast cells, and various forms of spiral vessels and ducts.

63. The outer bark and pith are often merely temporary tissues, of great importance in an early stage of growth, but soon exhausted, though after a different lapse of time in different plants, from the constant demand made upon the substances suspended in their protoplasm by the advancing bud or plumule. The former in such case is gradually thrown off; the latter being inclosed in the centre of the cylinder remains for many years, sometimes during the whole existence of the tree, being variously modified by the increase of the tree in length, or the compression of the surrounding solidified wood cells. The nascent wood consisting of ligneous fibre, bast cells and vascular tissue with the intervening plates or wedges of the medullary rays and the maturation of the second year's buds, requires an immense quantity of nutritive matter in addition to what is brought to them by the descending current of elaborated sap, and this is mainly supplied by the pith, which is often of considerable dimensions, and which expands in every direction, while the growth of the vertical tissue and medullary rays takes place only at their outer limit. It is in consequence of this necessity that where the young pith is destroyed by insects, as is not unfrequently the case, the shoots inevitably die. It is probable that the old pith is for a time not without its uses, as the cells contain a great quantity of air. In some cases the old pith becomes diseased, and communicates its taint to the surrounding tissues when young, and thus rapidly impairs their vitality.

64. Pith is by no means confined to the stem, but occupies other parts occasionally, as the petioles of Catalpa syringæfolia. It is, however, very doubtful whether it ever occurs in true roots. The character of its general formation and component cells varies much in different plants. They consist sometimes of simple parenchym, sometimes of dotted cells, and occasionally there are wide intercellular passages, as in the stellate tissue of rushes. *M. J. B.*

* When the cotyledons are accidentally destroyed, as by snails or insects, the first pair of leaves sometimes assumes their form and texture, and the primary bud or plumule is then developed, as in ordinary cases. We have observed this more especially in *Centaurea atropurpurea*, where the seedling plant, with its new pair of cotyledons, could not be distinguished from any other seedling.

LILY OF THE VALLEY.

Although this is only a common English plant, there is, perhaps, no greater favourite than it is, more especially with the fair sex, nor any more deservedly so; its beautiful foliage, lovely white smart looking flowers, and delicious perfume, all conspiring to make it an object worthy of general admiration.

For many years I have made a practice of growing a few pots of it, for the purpose of winter and spring decoration of the drawing-room, as well as the conservatory. They are generally grown in 6-inch pots, and the average number of flower spikes has been from two to two and a half dozen, though they sometimes amount to above three dozen to each pot; and most people who see them through the months of February, March, and April, are in raptures with their loveliness, particularly those from the neighbourhood of towns. I have heard but few people say that they cannot grow them, but almost everybody complains that they cannot get them to bloom well; and from what I have seen of their culture, I might say that the fault lies in taking too much trouble with them; indeed, their cultivation is so simple, that I have often thought they would be almost the best thing a cottager or dweller in a town could have for a window plant in spring and early summer.

The only thing required is to provide a few 5 or 6-inch pots, and a few eyes, about the beginning of March; just as the eyes begin to show above ground a little rather light sandy loam should be placed in the pots, upon about half an inch of drainage; seven or eight eyes should then be placed equidistant about the pot, on the surface of the soil, allowing the eyes to be about level with the rim of the pot. A handful or two of the finest of the soil should then be placed on the top of the plants, and a good shake of the pot, by striking the bottom of it against the ground a few times, completes the work; plunge the pots as closely together as is convenient, in tan or ashes, or in the garden soil, in a situation where they can have the full sun for a few weeks. About the middle of April or beginning of May remove them to a situation where they may be partially shaded; the north side of a low deciduous hedge is a capital place, but they must be kept plunged. They will require no more care than a little water now and then till September, when a coat of about 6 or 7 in. of rotten manure may be thrown over them. The rains will carry the fertilising matter from the manure gradually through the soil amongst the roots; and if you force them they may be taken up about six or seven weeks before they are wanted in bloom and started at once in a very mild heat—say 55° by day and from 45°

to 50° by night. Another portion may be placed in a Vinery not at work, or in a cold pit, and introduced to the forcing house at intervals, and those left in the cold house will be in bloom all through the month of April. If they are wanted later, it is effected by placing them behind a wall with a north aspect; by this means they might be had in bloom from January till the middle of June. When done flowering, if very early, they must be put somewhere that will afford them full sun and protection from frost, but any that bloom in April will do very well plunged in a sunny sheltered place out of doors, and removed to the same quarters for summer and winter as before recommended.

If grown by the cottager, or where there is no convenience for forcing them, they may be taken at once out of the plunging material, and placed in the warmest corner of a south window, where the sun can play full on the outside of the pit, and when they have shot up about an inch or two, a pan may be placed under them with a little water in it, which should be quite used up before any more is added. When in bloom, they require plenty of water.

Now, all this is very simple, and some may say scarcely worth a place in your columns; and, indeed, I believe that the only secret in their management is to keep the same plants in the same pots and never shake them out, never cut them down (that is, never make a clean "shave" of all the top, as I have sometimes seen done to the destruction of Strawberries, Asparagus, Lilies, &c.), and always take care to well mould them before winter, covering up dead tops and all. If any strings remain of the last year's foliage, they can easily be pulled off in spring. The specimen you lately received from me had been potted at least ten years, and although there had been perhaps a dozen flowers with two leaves attached cut from it every year for the last seven or eight years, it has never been cut over for the sake of tidiness, and never been shaken out or repotted. I generally find that they bloom strongest when they have been potted three or four years; and so far from being injured by forcing, they absolutely grew, I should say at least twice as large as any I ever saw grown in the open air; the two spikes of cut bloom that accompanied the plant I sent for your inspection were grown on the top of a flue in an intermediate house, and cut from a plant in a 6-inch pot, containing 29 spikes of bloom. Some plants I shifted into larger pots last year have bloomed very finely, but they are not so ornamental as when they perfectly fill the pot to the rim.

Their value as a shrubbery plant need not be dilated on here, as everybody has seen them growing perfectly wild; but some are of opinion that a portion of manure strewed over them every autumn would much enhance their beauty at the proper season. *H. Cox.* [Mr. Cox's specimen was a beauty.]

INGA PULCHERRIMA.

I NEED scarcely say that the brilliant scarlet tassel-like flowers of this plant are extremely ornamental; under ordinary treatment they may be had in perfection from January to February, but with a sufficient number of plants there would be no difficulty in having them from December till May. This may be effected by growing a portion of the plants early in the season, so as to be able to afford them a period of rest, after which they may be introduced into a forcing pit, where they will soon come finely in bloom; they may then be removed to a warm part of the conservatory or show-house. Cuttings selected of short jointed bits of the young wood, when about half ripe, planted in sandy peaty soil, afforded a gentle bottom heat, and the protection of a bell glass, root freely. As soon as they have got sufficiently strong to bear handling, they should be potted singly in small pots, placing them in a warm moist situation, near the glass, and shading them from bright sunshine till they have become well established. When their roots shall have reached the sides of the pots, shift into others two sizes larger, and attend to keeping them close and moist, placing them near the glass; and also syringing them freely over head, during bright weather. Some of the species are very subject to the attacks of red spider, which soon disfigures their foliage, if not well watched and syringed. Frequent stopping will be necessary to secure compact, well furnished specimens; the shoots should be allowed to grow some length, and then be bent down and tied, so as to check the flow of the sap to the points, in order to get the lower buds prominent before stopping; and unless this is attended to, stopping will be of little service, as only the top buds will start. The wood is, however, very pliable, and may be bent in any direction without danger, and by bringing the shoots down to a level with their base the buds along their whole length will be induced to start into growth, and well furnished specimens will be the result. The plants should not be kept growing too late in the season, but should be removed to their winter quarters towards the middle of October, and be freely exposed to light and air, to ripen the wood. During winter they should be very sparingly supplied with water at the root, and a temperature of 45° or 50° will be sufficiently high during their season of rest; for if a high temperature is maintained while the plants are kept dry at the root, they will be devoured by red spider.

As early the following spring as it may be convenient to place the plants in a close moist growing atmosphere, give them a liberal shift, and as soon as the roots strike into the fresh soil prune well in, and attend to bending down the shoots, so as to induce the buds to break freely. If nice bushy specimens of the desired size are obtained, it will be unnecessary to stop them again this season, and when the first growth is completed the plants may be allowed their season of rest, placing them out doors under the shelter of a north wall during the autumn months, and removing them to an intermediate house or pit when the weather becomes cold or wet. After allowing them about two months of rest, and getting the wood well ripened, they may be brought into bloom at any season by merely placing them in a sufficiently warm moist temperature to induce growth, and keeping them properly supplied with water at the root. I ought perhaps, however, to state that the flowers are produced on the young wood of the previous season's growth, consequently pruning must not be thought of until after flowering. But it must be attended to as soon as the beauty of the flowers is over, otherwise the plants will soon become extremely unsightly. By attending to pruning, and affording the plants plenty of pot room, specimens of almost any size may be obtained in the course of a few years, and by supplying them liberally with manure water, when shifting cannot be conveniently resorted to, they may be retained in vigorous health for many years; or when it becomes inconvenient to increase the size of the pot they are in, they may be disrooted sufficiently to permit their being repotted in the same sized pots, thus affording fresh compost, with a view to secure healthy vigorous growth.

For soil, take one-third rather strong turfy loam, one-third rich fibry peat, and one-third well decayed leaf-soil, well intermixed with plenty of clean sharp sand, to secure an open medium for the roots, and for the percolation of water after the decay of the fibre has taken place. *Alpha.*

Home Correspondence.

Peach Protector.—From the very changeable, and often severely cold state of our climate, at this season of the year, and the consequent failure of our crops of Peaches and other wall fruits, it becomes a serious question how most effectually to protect, not only the early blossom of these valuable trees, but our wall fruits generally; and the great desideratum is, not only to do this effectually, but with as little trouble and as little expense as possible. As I find, from experience, that I have attained this very desirable object, and that, too, beyond all chance of failure, I hasten to make it known through your columns, in which I find such information often asked for, and I hope those more immediately interested may be in time to secure their crops this season, and thus prevent a repetition of the loss and disappointments so generally felt last year. By this very simple, yet most effective method, I attain the following valuable desiderata: 1st. Perfect security and protection from the most severe frosts during the night; 2d. Complete exposure of every part of the tree to the sun's rays during the day; 3d. Avoidance of all obstruction by shadow or shade, either on the wall or on the border opposite, so that neither room nor ground is lost by using the protector; 4th. Such facility of shutting up at night and opening in the morning, that a dozen trees may thus be protected, and again exposed, in less than five minutes; 5th. No risk or chance of either the blossom or fruit being rubbed off, or in any way injured; and last, not least, a lock may be so placed on each as to effectively prevent the fruit being stolen. Each protector, for a tree of the usual size, may be made at an average price of 6*s.*, and, as it will last for a dozen years, the general cost will thus be about 6*d.* a season for each tree; while the construction is so simple that it may be made by any handy gardener or country mechanic. While the most plainly made have a neat appearance, they may yet be so constructed as to prove decidedly ornamental to the garden, while in use; and they can be removed with ease and facility when the cold season is over. I will now briefly describe its very simple mechanism. Procure half-inch or three-quarter boards, 4 inches wide, and with these make a frame the length and height of the tree. On a line with its front edge nail upright bars, 3 feet apart, of the same sized boards, but with their broad side out. Tack upon these divisions yard-wide scrim canvass (which costs 4½*d.* per yard), or any other, more ornamental and expensive, according to taste. The frame or screen being now complete, let your blacksmith make a pair of common hinges, called hooks and rides. Nail the hollow portion to the bottom of the frame, in front, and near each end; and drive the hooks into slight blocks of wood, a foot long; sink these blocks on a level with the ground, and at such a distance as will allow the edges of the frame to be drawn up close to the wall, by means of a pulley, fixed at the top of the wall, and near the middle of the tree, or opposite the centre upright bar. With this pulley and rope the screen can be lowered to an angle of 45°, or to any other distance required, so as to admit the full sun to the tree, and at the same time cast no shadow. On being again drawn up at night, the frame will completely inclose the tree, and effectually protect the blossom, &c., from the most severe frost; while its canvass front will be 4 inches from the blossom or fruit, thus preventing all chance or risk of rubbing off, or other injury. I trust that the above description will be found sufficiently plain to enable those interested to make and adopt my principles; and that they may be equally well satisfied as myself with the result. *Æ., Surrey.*

Mr. Billington and the Chopwell Woods.—Mr. Billington having favoured me with a copy of his letter to Mr. Milne, with your permission I will make a few observations upon it in your columns. Into Mr. Billington's *casus belli* with Mr. Milne I will not enter, further than to observe, that Mr. Billington's letter supports the concurrent testimony of all parties here, that he thoroughly understood the management of woodlands in the valley of the Derwent; and I have little doubt, if he had been permitted to remain, he would have returned a very handsome yearly sum into the Exchequer, which I am much afraid is more than any of his enlightened successors will do. I am quite satisfied that Mr. Billington is right in his opinion, that a second profitable crop of Larch will not thrive upon this ground at such a brief interval of time; and as the former crop under its late gallant deputy surveyor gained a signal victory over the young Oaks, so the day of retribution for the Larch is at hand, and the Oak shoots will amply avenge the cause of their murdered fathers. Indeed, I much doubt whether any of the Larch planted this very dry season will live to do battle at all, so completely have they taken the "sap" out of the land with their drains. If, in 1839, when the hurricane reversed the Chopwell order of things, converting the smothering into the starving system, the then gallant deputy surveyor had selected all the good young Oaks, and filled up the places of the bad ones with Larch, the Oaks would have recovered from the shock, and the Larch might now have been taken out. Instead of that the ground was left to right itself, and the young Oaks being deprived of the yearly increasing warmth the Larch would have afforded them, stood still, and presented the very uncomfortable looking crop of besom shanks that Mr. Clutton found when he visited them. Whether they were then past recovery is a point upon which I need not enter; for even if the property was ruined as a forest, there was abundance of all sorts of trees left, as, with the scattered masses of old Oak, made Chopwell a most marketable estate for country residences. Instead of so converting it, an order was issued for a clean sweep, and in lieu of the well broken sky line of a wooded horizon, we have now a dingy, dreary, drain-scored space, looking, for all the world, like a piece of roasting pork. This season the work of destruction is to come lower down the hill, and we shall soon have the farm labourer of this very dear district enhanced and deranged, by all hands rushing off to the Chopwell bark-wood—though really, at present prices, peeling an Oak is very like the penurious exploit of skinning a flea for the sake of its hide and tallow. Now that they have ruined our scenery, the only good use ever got from these imitation woods, the landowners, I think, may fairly complain of being saddled with the rates this property paid before the leases reverted to the Crown. *R. S. Surtees, Hamsterley Hall, April* 10.

Gravel.—Can any one give an account of the successful cultivation of plants in pure gravel? I have been informed that Roses, of some sorts, and Rhododendrons, will thrive under such treatment. I should like to know about that, and about the subject generally. *A. H.*

Steeping Seeds.—The germination of seeds is a thing which many are interested in, and any method to insure their pushing into growth more speedily than usual would doubtless be received by many with delight. I have found the following plan of steeping them to be of service in my own case. When about to sow seeds, such as Peas, Broad Beans, French Beans, &c., I collect some sheep-droppings beforehand, and put them into a vessel with water, enough to moisten them. Into this I put my seeds, but of course into something by means of which they may be conveniently withdrawn when required. Thus situated I let them remain till well soaked, when they will be in a fit state for sowing. I have found that for Beans about 36 hours are required, and for Peas about 24 hours. Steeping, however, does not apply to the above-mentioned seeds alone; it may be practised with advantage on many others, and doubtless many flower seeds might be safely treated in this way as well, and with success. This will, however, very much depend upon whether the plants intended to be raised are gross feeders or not; and also whether the soil contains much organic matter or not; for of course the more it contains the less time in proportion will the seed require to soak before being sown. This practice will be found (on poor soils especially) to be of very great service to gardeners in general; for it will not only hasten their crops, but will make them as strong and vigorous as need be; and those who have never tried it would be quite surprised to see the difference it makes, an instance of which I will now give. In 1852 I made a trial with French Beans,—a small quantity was placed in the soil, and at the same time a small quantity in sheep-droppings, as described, where they remained about 44 hours; they were then taken up and put in soil near the former, and the result was surprising; but at the time the former were about 8 inches high, the latter were, to the best of my recollection, nearly double that height, and their foliage testified as to the state of health the plants were in. I have since practised steeping with good results, and others who may be induced to give it a trial will no doubt be similarly rewarded. *Joseph Divers, Maidstone.* [Would they not have grown just as well if you had steeped them in clear rain water?]

Coniferous Trees—the Deodar, Douglas Fir, Huon Pine, &c.—I should be much obliged to your correspondent "J. R., Oxfordshire," if he would tell me on hat kind of soil it is that he finds the Deodar hardier han the Douglas Fir. I have seen some places in York-

shire and Lincolnshire which make me think that the Douglas Fir does not like a limestone soil, and will hardly grow at all on some of the beds of oolite; but that, on these same soils, the Deodar is particularly vigorous. At Boynton, on a loamy sand above chalk, the contrary is the case, the Deodar is not healthy, and suffers from frost, whilst the Douglas Fir is vigorous and quite hardy. Your correspondent "J. R." has an interesting letter in the same number (that for April 1) respecting the age, size, and quality of foreign Larch. I have just cut down a Larch here 76 years old, 16 inches in diameter at 10 feet from the ground, with only an inch and a quarter of sap wood, perfectly sound throughout, and very fine red wood. This grew on what is called, by writers on the geology of Yorkshire, the calcareous grit, beds of sandy limestone varying greatly in quality. All the Larch I have seen here appear to be of similar good quality, whilst those at Boynton, of a similar age, are of inferior quality, and liable to be rotten at the heart. I have no doubt they have both been grown from the same seed. I think there are at Boynton American Larch (Red Larch) two feet in diameter, and more. The Black Larch (Tamarach or Hackmatack) of the same age are not half the size. Small plants of the Huon Pine (Dacrydium Franklini) have stood the winter uninjured with me. At Mr. Backhouse's garden at York (which is in a cold exposed situation) a large plant has stood the winter, with only the extreme tips of the shoots injured, as described in another instance by a correspondent of yours a few weeks ago. *C. W. Strickland, Hildenley, near Malton.*

Wood Paper.—For several years I have entertained the idea that paper might be made from wood. I was first led to think of it while attentively watching the movements of a wasp, as it gathered some fine fibre from a Larch rail, which had been exposed to the action of the elements until its outer surface had become covered with fine flax-like hairs or fibres, which I suppose had been caused by the bleaching process it had undergone. I scraped off a portion of the surface of the rail, which was easily formed into a pulp. I then thought that good paper might be made from wood; but how to convert large pieces of it into paper I could not tell, unless by the process of scraping, which I believed would be too expensive to allow wood to be used profitably for paper-making. "The Mulhausen experiment" appears to have been made with non-resinous wood. I think that resinous woods, such as young Larch, Pines, &c., might prove as good, if not better, than non-resinous material, as it is possible to convert it to a state of great whiteness by extracting the resinous matter, then washing, bleaching, &c. Some time ago I read in your columns an account of a process by which Fir leaves were cleaned of their resinous matter, and rendered useful for domestic purposes, for bedding, &c.; and I have been thinking whether it would not be possible to extract the resinous matter from the wood of Pine trees by means of a similar process; if that could be done, I think the wood could be easily made available for paper-making. Could sawdust not be made available for paper-making? The dust of Pine, or resinous wood, by extracting the resinous matter from it, and then grinding and macerating; and the dust of non-resinous woods, simply by grinding and macerating into pulp? I do not suppose that the length of fibre is an object, provided each fibre is reduced to a state of peculiar fineness; and an extremely fine mass of fibre might, I think, be easily produced from sawdust. Suppose a tearing machine was made by placing a number of circular saws close together upon one journal; or if not close together, about 1-12th or 1-16th part of an inch apart. If saws were placed to form a breadth of three or four inches, and the wood cut into boards of from one half to one quarter of an inch in thickness before being applied to the machine, a great amount of force would not be lost in friction, and I think the machine might be worked with the same power as an ordinary saw-mill. *A. Patterson, Maristow.*

Foreign Correspondence.

Memoranda from the Antipodes.—*Colouring of Grapes.*—Through the irregularity of our postal communications with Europe, consequent upon the repeated failures of the Australian R. M. S. N. Company, a file of the *Gardeners' Chronicle* for part of December and January, 1852 and 53, has only just been received. I have interested myself in a discussion which I find in them relative to the occasional imperfect colouring of black Grapes. In a concluding paragraph of a Leading Article upon the subject, in the *Chronicle* of the 1st of January, the writer expresses a desire for information, whether this accident be known in warmer climates, such as the Vine districts of France and Spain. Perhaps, although late to mingle in the controversy, a few antipodean memoranda may not come amiss towards a right appreciation of the question; and as I have paid considerable attention, during more than 30 years, to Vine culture in this climate (which is extremely favourable to the perfect ripening of the Grape), having in that period planted, and up to the present time managed, more than 25 acres of Vines, I will offer no further apology for sending you the following observations. The Black Hamburgh, though not extensively cultivated for wine, owing to its deficiency in sugar, is a favourite eating Grape, and next to the Chasselas preferred by us for the table. We grow it in considerable quantity in a garden, trained to vertical trellises about 5 feet high, with provision, by means of temporary supports of the Indian Reed, for the extension laterally and upwards, at various angles of inclination, of the young shoots as they grow; the object being to afford the greatest quantity of light and air to as much foliage as the space devoted to each Vine will admit of, and to shelter the fruit from the direct action of the sun's rays. I probably need not explain that there is no deficiency of atmospheric heat, the Grapes being perfectly ripe throughout the month of March, or two months at least before the first approach of winter. It is not the practice to stop the young shoots until they have reached the full length of the supports, or to thin out either these or the laterals, further than to admit light and air sufficient to maintain a healthy colour in the under leaves down to the base of the shoots. Gourmands or water-shoots, and those which sometimes spring in clusters from the old wood, are of course rubbed off as they appear. Although it is the rule to have the Black Hamburgh, and all the black Grapes, perfectly coloured for some time previously to their being quite ripe, we occasionally see instances to the contrary; but never under garden culture, excepting in such cases of deficient nourishment as these: 1st, when the Vine is over-cropped through injudicious pruning and general treatment, or starved through the occurrence of long-continued dry weather, at the critical period between the stoning of the fruit and its first swelling off to maturity; 2d, when, upon a particular branch, injury has been caused to the bark by accidental fracture, the gnawing of some insect, such as the grasshopper, or by the sun during an intolerably hot day; or 3d, when either of the last two causes have operated upon the stalk of individual bunches. In the garden, so entirely do we consider the imperfect colour of the fruit a symptom that the Vine is over-cropped, that it is immediately relieved of the greater portion of the bunches, and at the winter's pruning cut back very short, besides having a good dressing of suitable manure applied at root. I cannot recollect in garden culture an instance of badly-coloured Grapes upon Vines in vigorous health (that is, properly furnished with healthy well-developed leaves), however screened by that foliage the fruit might have been. Not to make myself imperfectly understood, I mean, so long as air and light enough be admitted to keep the leaves down to the bases of the shoots in healthy condition. In a vineyard, where it is the practice to encourage the production of the fruit much nearer to the ground, I have witnessed the imperfect colouring of the Grapes from a different cause. The variety affected was the Black Hermitage (the "Scyras" or "Sirrah" of the celebrated vineyard of that name on the Rhone), which has a very rambling, rampant habit for a wine Grape. The Vines in question were growing in a low, rich spot, where the soil is both deep and porous; and there were probably three times as many plants to a given area as the nature of the soil and the particular variety rendered advisable. Owing to the sudden abstraction of labour attending our gold crisis, the Vines, which had been pruned to the height of about 18 inches from the ground, and attached to stakes 4 or 5 feet high, had been allowed to continue their summer's growth unchecked and untouched. They grew so much that, from the tops of the stakes, their shoots were completely interlaced with those of the adjoining Vines, so as to render the rows quite undistinguishable through the canopy of luxuriant foliage. Long before the vintage the under leaves had become sickly and yellow, from the exclusion of light and air. At the usual period of maturity the crop, which was sufficiently abundant, remained in very imperfect condition. The Grapes were sweet to the taste, but deficient in sugar, and so badly coloured that only the more exposed portions of the bunches and berries had a purple tinge; the less exposed, though swelled off to the usual size, and with other indications of maturity, retained a greenish colour, more or less splashed with red. After being allowed to hang upon the Vines much beyond the usual time without sensible improvement, the crop was gathered to save it from rotting. I may observe that the season had not been unfavourable, and that the same variety hard by, but much less closely planted, had ripened its fruit perfectly, with the ordinary fine colour and bloom. Where the Grapes were badly coloured, the accumulation of succulent growth, with largely developed leaves, had maintained the surface of the ground and the surrounding atmosphere in a damp, unwholesome condition. It is of course impracticable to distinguish the mischief produced by the exclusion of light simply, from that caused by a stagnated, damp atmosphere; because the two conditions are scarcely to be separated in out-of-door cultivation. I do not consider the state of the soil to have been unfavourable; it never remains wet after any quantity of rain, being so thoroughly drained in consequence of its great depth and porous character. Having stated the facts, I leave the conclusions to be drawn by authorities more competent than I am.

Here are a few more facts indirectly connected with the question. An extremely hot day occurring about mid-summer, the heat reflected from the ground, or a current of hot air, affected about 2 acres of vineyard in a remarkable manner. The under leaves, which were perfectly screened from the direct action of the sun, appeared to have their circulation suddenly arrested. They were not scorched, but, as well as the under growth of young wood, soon began to assume a premature autumnal appearance, and the former to fall off. By the end of four or five weeks, or before the Grapes were more than half ripe, the bunches were left hanging quite bare and exposed to view, but still well sheltered from the direct action of a nearly vertical sun, by the abundant foliage, which continued in perfect health upon the young shoots, upon probably three-fourths of their length, leaving enough apparently for the healthy circulation of the plants. The Grapes seemed to ripen more slowly than usual, but became perfectly well coloured, and fine to the eye. At the vintage, however, their must, tested with the saccharometer, proved to be less dense than usual by 15° to 18°; or, to express it differently, there was a deficiency of about half a pound of sugar to the gallon of must. From another portion of vineyard, occupied by the same varieties, which did not at all suffer from the excessive heat, the crop was gathered at the same time, the must proving to be rather richer in sugar than usual. There was nothing in the appearance of the Grapes upon the injured Vines to lead one to suspect such a difference. The season had been very favourable, and the period of gathering had been postponed to a later day than usual. I may mention, likewise, that even the injured Vines continued to make fresh growth for several weeks after the accident to their foliage, but not to any considerable extent, and that there was nothing unusual in their state, except that their lower leaves and the corresponding wood appeared to have ripened six or seven weeks earlier than usual. The foregoing circumstances would seem to indicate that the leaves which are situated in immediate relation to the bunches of fruit, exercise an important influence upon their richness in sugar, but that, other circumstances being favourable, the latter will become perfectly well coloured, although the lower leaves should be wholly removed.

Here are a few more memoranda relative to Vine culture, the result of our observations. The fruit of young Vines is never to be compared in quality to that from plants of mature age, which are well tended. It may be as fine, perhaps finer to the eye, but it is relatively coarse and thick skinned, and deficient in the high aromatic flavour which characterises the produce of healthy older Vines. Until Vines attain the age of seven or eight years, I do not think their fruit is in perfection, if even then. In vineyard culture, we are satisfied that the quality of the wine sensibly improves as the Vines acquire age. The wine of the same year from Vines 20 years old is better than that produced by the same sorts, in the same soil, of only 10 or 12 years' growth. I have no doubt of this fact, in our vineyard at least. We do not esteem Grapes for the table after they have attained the maturity desirable for wine; they are then scarcely wholesome, their juices becoming too viscous and sugary to be easily digested. The varieties most rich in sugar, out of several hundreds which at various times have been introduced from Europe, are the Verdelho, from Madeira, the different varieties of the Pineau, or Burgundy, and the Frontignans. Few of the others approach these in sugariness. A Grape may be very sweet to the palate, and yet contain very little sugar, witness the Chasselas; the converse also is frequently observed, a sort rich in sugar which does not impress its sweetness in any very sensible degree upon the palate. We consider the must to be too poor in sugar even for the lighter descriptions of wine, when its specific gravity does not exceed 1.085 or 1.086. The greater part of our dry wines are made from must ranging from this point to 1.110 or 1.112. They are considerably stronger than the majority of the French wines, and appear to be capable of being kept with advantage for a number of years. When the must attains still greater sweetness, it requires the fermentation to be carefully managed to insure the attenuation of the whole of the sugar; and when a much higher degree of ripeness is reached, which is sometimes managed by keeping such Grapes as the Frontignans to dry upon hurdles, in the shade, for several weeks after they have acquired the greatest maturity upon the Vines the season seems to admit of, a very rich, strong-bodied sweet wine is the result—less sweet but more spirituous than the boiled wines of Lunel and Frontignan, and much less sweet than Constantia, with more of the character of Malaga, perhaps, but with a perfume and flavour peculiar to itself. We have no means of ascertaining correctly the density of its must, the scale of the saccharometer we use not extending sufficiently, but it is probably from 1140° to 1150°. *W. McArthur, Camden, N. S. Wales.*

Societies.

Linnean, *April* 4.—The President in the chair. J. J. Stainton, Esq., was elected a Fellow; and Mr. C. M'Intosh, of Dalkeith, an Associate. N. B. Ward, Esq., exhibited flowering plants, in a closed case, of Gentiana verna, received by him two months since from its recently discovered locality in Galway, Ireland; together with a cut flowering specimen of Andromeda tetragona, accompanied by the following note:—"The specimens of Gentiana were only received by me two months since, but the plant itself has flowered on my open peaty banks for the last three years. The Andromeda is flowering on the same bank, now for the first time with me. The season is unusually backward. The Erica carnea, which came into flower in the first week of January in 1852 and 1853, did not flower this year till the middle of February; and Erica arborea is only just coming into flower, although in the last two winters it was in full flower by the third week in January." The following paper was read:—1, "Remarks relative to the affinities and analogies of natural objects, more particularly of Hydrocephalus, a genus of Coleoptera," by J. Curtis, Esq. The author expressed a fear, that in fixing the position in the scale

of nature of the many extraordinary new forms which have been discovered of late years, the shadow had been too frequently taken for the substance, and analogies mistaken for affinities. He remarked that the natural system had long been to naturalists an object of pursuit, which they would probably never overtake; that the truth appeared to be that there is no perfect natural system according to our limited notions; and that it would prove a stumbling-block to those who thought otherwise, to find that where a few links are forthcoming which unite certain groups, there are a vast number more discovered, which disturb what with fewer materials promised to be a complete arrangement. Thus, he observes, we have lines broken, circles not meeting, most curious types presenting themselves to augment infallible numbers, and to be dismissed by the theorist as inconvenient intruders. The remainder of the paper was occupied by a discussion of the affinities and structure of the Hydrocephalus armatus, an anomalous beetle, resembling so many individual members of different families, yet agreeing with none, that it has, from its first discovery, been a subject of speculation. Mr. Curtis considers it more nearly related to the lamellicorn group of beetles, than to the longicorn group, with which it has generally been associated.

Entomological, *April* 3.—W. W. Saunders, Esq., F.L.S., V.P., in the Chair. An interesting collection of minute insects found in Ceylon by Mr. Thwaites, containing many very interesting and novel Coleoptera, Hymenoptera, &c., was presented to the Society by that gentleman, who is engaged as the superintendent of the Botanical establishment at Paradenia in that island. The chairman also exhibited several interesting species of butterflies and moths, with their larva and pupæ, which he had received from Mr. Thwaites; and Mr. Spence communicated a letter from the same gentleman, relative to the destruction of the bug which attacks the coffee plant in Ceylon (and which appears to be one of the Coccidæ) by armies of red ants, which make their nests in the cinnamon trees at the end of the boughs, drawing the leaves together for a covering. It had been proposed to transport these insects to the coffee plantations, but they have proved as annoying to the natives employed in the plantations as the bugs are to the coffee plants, thus rendering it questionable whether they can be effectively employed; independent of the question (suggested by Mr. W. Wood) whether the ants really devour the Coccidæ, or merely visit the coffee plants in order to feed upon the honey dew emitted by the Coccidæ in the same way as it is by the aphides. A box of interesting Hymenoptera collected in Dalmatia by M. Bottari (who is about to start to Mexico, to collect objects of natural history) was exhibited by Mr. Baly. The chairman announced that a new part of the Transactions, completing the second volume of the New Series, was ready. Mr. S. Stevens exhibited some very beautiful butterflies recently received from Mr. Bates in Brazil, including a great number of Erycinidæ, of many species of which Mr. Bates had succeeded in determining the sexes which had hitherto been placed as distinct, and even in different genera. Also specimens of the magnificent new carabus and both sexes of Dicranocephalus Wallichi just received from Mr. Fortune in China. Mr. Douglas exhibited some blades of Grass infested with the larvæ of one of the species of Elachista, a genus of Tineidæ, the transformations of which were previously unknown, likewise the transformation of Depressaria capriolella from Sanderstead. Specimens of the very rare Stauropus Fagi and Gluphisia crenata, reared from the larvæ were exhibited by the Rev. J. Green from Halton, Bucks. Mr. Douglas communicated a notice from the French Annales on the habits of Bolbocerus mobilicornes, which had been captured in considerable numbers, flying at dusk over Lucerne fields near pathways, and digging holes in the ground. The papers read were a description of a case-bearing species of Bombycidæ, sent from the Amazon by Mr. Bates, after whom it had been named Perophora Batesii, by Mr. Newman. Descriptions of numerous new species of Lucanidæ, collected in China by Mr. Fortune, by Mr. Saunders; and descriptions of the larvæ of several species of Coleoptera, by Mr. Curtis; the species are Velleins dilatatus, the larvæ of which infesting hornets' nests had been communicated by Professor Henslow. Elater rhombeus, found in a decayed tree; Boletophagus reticulatus, found in a Boletus in Scotland, by Mr. Foxcroft; and Prostomes mandibularis, found in rotten wood at Pau, by Mr. Curtis himself.

Reviews.

Cyclopædia of Chemistry, with its applications to Mineralogy, Physiology, and the Arts. By Robert Dundas Thomson, M.D. Griffin and Co. 8vo, pp. 539.

Notwithstanding the numerous and in many respects excellent treatises on chemistry which have appeared in this country during the last few years, a want has often been felt of some work, compact, accurate, easy of reference, and in which all that interests people in general is stated clearly and fully, whilst matters interesting solely in a scientific point of view are either omitted altogether or stated very briefly. That want is well supplied by the Cyclopædia before us. The arrangement being alphabetical, reference is as easy as possible; and the author has explained with great clearness, and as fully as necessary, everything which is likely to be sought for in a book not professing to be an exhaustive treatise on the science of chemistry in general, or of any branch of it in particular. Substances of importance in the arts, or in agriculture, are treated evidently by the hand of a master, and, although short, are in no respect unsatisfactory. The article guano affords a good example of the mode in which the author has contrived, by judicious exclusion and concise statement, to compress his matter.

"*Guano. Huano.* The urine of sea-fowls, deposited on the coasts of Peru, Africa, &c., of great value as a manure, in consequence of its containing the salts and nitrogen necessary for the food of plants. It is usually mixed with a certain amount of granite powder from the soil on which it is deposited. Sometimes it contains bones of birds, feathers, &c.; and often salts, such as ammonia, phosphate of magnesia, bicarbonate of ammonia. It has been used for ages as a manure by the Peruvians, and was first brought into prominent notice in Europe by Humboldt and Boussingault; but more recently by Liebig, who has done great service to our agriculturists in this and other respects. When genuine it should have a light brown colour, with a smell of ammonia; should, when burned, leave a fine white ash of bone earth, &c. This ash, when heated with dilute muriatic acid, should not effervesce, indicating the absence of chalk or carbonate of lime, and should dissolve with the exception of less than 2 per cent. of white sand and microscopic shells. When treated by water alone, the best Peruvian guano I have found to yield fine crystals of oxalate of ammonia. As the other constituents are pretty equally diffused in different shipments of guano, one of the most important tests of its value depends on the amount of uric acid and ammonia which is present. But in all analyses the amount of the different constituents should be determined. From a long experience in the examination of guano, imported at Glasgow and elsewhere, I have constructed the following tables. Although I have frequently had submitted to my examination adulterated samples, I am happy to say, for the credit of importers, that I have scarcely ever found sophistication to be attempted in their hands, and I have therefore strongly to recommend farmers to unite and purchase their stocks at the ship's side, the price to be determined by chemical analysis:—

	A	B	C	D	E
1.	11.90	9.40	25.02	37.72	50.30
2.	5.20	9.43	15.07	4.65	1.00
3.	53.90	51.58	28.98	30.13	13.60
4	27.80	27.98	29.65	26.00	12.10
5.	1.20	1.59	1.28	1.5	15.00
6	18.38	17.28	6.85	5.31	3.47

1, water; 2, soluble salts, phosphate and sulphate of potash, chlorides of potassium and sodium; 3, organic matter, containing uric acid, ammoniacal salts, &c.; 4, phosphate of lime and magnesia; 5, siliceous matter from the soil; 6, ammonia. A and B, fine specimens of guano from Chincha, Peru, imported by John Thomson, Union Street, Glasgow. C, Inferior Peruvian guano. D, African guano. E, Guano from Ailsa Craig, coast of Ayrshire; along with the phosphate of lime is included 1·5 carbonate of lime. A specimen of adulterated guano I found to consist of water 26.60, volatile matter containing 4½ ammonia 27.4, phosphate of lime 12.09, carbonate of lime 10.58, sulphate of lime and peroxide of iron 1.84, sulphate of soda and some potash 2.3, chloride of sodium 5.06, river sand 12.56, cinders 1.57. Independently of its river sand and other substances, the presence of so much soda salts is a suspicious circumstance, as potash is the principal alkali in guano soluble salts."

The articles on atmosphere, blood, copper, fermentation, glass, iron, kelp, lead, soda, sulphur, water, and other common things, are characterised by the same judicious treatment; and the heads, acids, analysis, atomic weight, blowpipe, &c., show that whilst the wants of general readers have been carefully supplied, those of the student and experimenter have received equal attention. Nor is the Cyclopædia confined to pure chemistry; the requirements of students of geology have been by no means neglected, and by the labours of the late Dr. Thomas Thomson, the author has been enabled to supply a copious index of mineralogical synonyms, in addition to many new analyses published for the first time.

The text is illustrated by many excellent drawings, some of which, representing vegetable structure, are not usually found in works like the present. The volume itself, which appears to be the first of a contemplated series of portable Cyclopædias to be published by Messrs. Griffin and Co., is nicely printed and got up, and should the succeeding volumes be as ably and conscientiously edited, "Griffin's Portable Cyclopædias," will deserve a high place amongst our works of permanent utility.

New Plants.

57. Aphelandra lateritia.

A. lateritia; foliis ovato-lanceolatis in petiolum longum basi teretem decurrentibus cauleque carnoso glabris, bracteis ovatis integerrimis pubescentibus calyce longioribus, corollæ labio superiore integro inferioris lobis oblongis obtusis lateralibus duplò minoribus.

A very handsome stove plant, native of Guatemala, where it was found by Mr. Skinner, who gave it to Messrs. J. Weeks and Co., of the Nursery, King's Road, Chelsea. The leaves are in texture like those of Passiflora laurifolia, and have stalks fully as long as the blade. The flowers form a cone-like head, 4 or 5 inches long; with dull scarlet corollas, the tube of which is rather yellow. It is undoubtedly very different from any of the species described in De Candolle's Prodromus.

Garden Memoranda.

Mr. Gaines' Nursery, Battersea.—The show-house here (a span-roofed one) is at present extremely gay with Acacias, Rhododendrons, Kalmias, Deutzias, and other spring-flowering shrubs. On the middle of the centre table are Camellias, supported on all sides by large specimen Azaleas, the greater portion of which is in full bloom. Among the best were Calypso, a fine large rosy pink kind; rosea punctata, and Holfordiana; the latter an extremely showy variety, with brilliant rosy pink semi-double blossoms, which are produced in sufficient abundance to make a fine display. Other sorts consisted of floribunda, multiflora, magnifica, and dilecta, the last a pink kind, with blossoms measuring at least 4 inches across. Among Rhododendrons, aureum was coming finely into bloom, as was also a seedling, said to have been raised from ponticum, crossed with the white tree Rhododendron. It had compact heads of pink flowers, which, being shaded with purple, had a fine mottled appearance. The young plant of R. javanicum, which was shown in such good condition at a late meeting of the Horticultural Society, in Regent Street, is now producing seeds, which it promises to ripen. On the side shelves were numerous examples of Linum flavum, a useful plant for spring decoration; Pheasant's Eye and white Pinks; Lachenalia bicolor, and other plants of a similar description. Another house, 80 feet long, was entirely filled with young Pelargoniums, which are very extensively grown here, not only for "furnishing" but also for the purpose of exhibition. Of young plants of Tom Thumb there were many thousands, for which there is at all times a great demand. The kinds of Pelargonium used here for forcing are Mrs. Johnstone, Gage, album multiflorum, Phyllis, Surpass Napier, Mars, Gauntlet, and a purple seedling. The latter was not named, but its deep purple flowers make it particularly striking and attractive. The various variegated kinds, as Attraction, Mountain of Light, &c., were also plentiful. Of scented Pelargoniums, one of the greatest favourites is Odoratum variegatum, a sort with small leaves, margined with white, and very strongly perfumed. The stage of a lean-to house, 70 feet long, was wholly devoted to the growth of Roses in pots, the varieties employed for that purpose here being Fabvier, Abbé Moiland, Cramoisie superieure, Goubault, and yellow Noisette. These have been in bloom more than a fortnight, but never being all out at one time the effect they make is not so striking as might be imagined. Cytisus racemosus is cultivated in quantity, large pitfuls of it being here in different stages of growth. Being extremely showy, and remaining a very long time in beauty, it is a plant much prized for all purposes of decoration in which hardy greenhouse plants are employed. Calla æthiopica is also largely grown, its white trumpet flowers being often used in table bouquets. A house of Mimuluses was in full bloom. Many of them were named sorts; but there were also numbers of seedlings, some of which are very promising. Considering the little care which Mimuluses require in the way of cultivation, and the display they make when in bloom, it is surprising they are not more generally grown than they are; for when judiciously introduced among other plants, on a greenhouse shelf for instance, they certainly produce an amount of gaiety at this season, which it would be difficult otherwise to obtain. Cinerarias, named sorts, are also now in full beauty, and there were, likewise, a few seedlings, some of which are very pretty; but scarcely sufficiently distinct, perhaps, from existing kinds. Lady Hume Campbell—white edged with blue—is still one of the best. For autumn "furnishing," Kalosanths are found to be invaluable, and therefore stagefuls of them are grown here for that purpose. Double white Primulas have been blooming very finely, but their beauty is now nearly over. Of hardy sorts in the open grounds, we noticed several examples of the double yellow, growing in a bed intermixed with the pretty Persian Iris. Calceolarias, Acacia armata, Fuchsias, Myrtles, and Verbenas are abundant here, more especially the latter, of which there are some thousands. Many of the Fuchsias struck from cuttings put in this spring are already thriving plants. In a houseful of large specimens of the finer kinds of Rhododendrons, there were some interesting seedlings, the most striking of which were Orion, Scarlet, Queen Victoria (white, spotted with crimson), Prince of Wales (white, suffused with pink), and Princess Royal, white. These are all good kinds, well worth attention; one or two plants of Gaines' Floribunda Carnation were in bloom. It is a rose flake, and an excellent sort for forcing. Clove Carnations in the open ground have suffered from frost to some extent, but not near so much here as they are reported to have done in some other places. Outdoor Hyacinths have been very fine here this spring; and Tulips in beds, to which no protection has been applied, are unblemished. Double Jonquils are in full blossom, and a much finer show they make than the single kind, which is more common. The Dielytra spectabilis is uninjured by frost, while the foliage of the Cryptomeria, and that of a few other Conifers, has suffered considerably; it is but right to state, however, that they are, from their position, much exposed to cutting winds. Several beds were filled with Narcissi for forcing, home-grown roots of which are preferred by Mr. Gaines for that purpose to those which are imported. Ground which had been trenched and ridged last autumn is being levelled and put in order for Dahlias, which are being hardened off in cold frames, preparatory to their being planted out as soon as all danger from frost is over.

FLORICULTURE.

THE PINK.—In a good Pink the stem should be strong enough to support the flower without drooping, and not less than from 10 to 12 inches high, which will elevate it above the foliage. The calyx or pod ought to be proportionately long, straight, and not too narrow, but correspond with the size of the flower; the base nicely rounded off towards the stem, the upper divisions equal in size, not incurved but rather turned outwards, so that the flower may expand freely and without bursting out at the side. The petals should be broad, flat, and substantial, and as free from indentation on the edges as possible. It is not desirable for the flower to be too double, but there ought to be a sufficient number of rows of petals to show symmetry without being crowded, each row being smaller in size than the next below, lying over each other in a regular imbricated form. If a laced kind, the belting should be even, and equal in breadth, surrounding the outer edge of each petal, and uniting with the eye. Whatever the colour is, it ought to be uniform, rich and solid. In the purple, a rich purplish maroon, and in the red, the nearer approach to scarlet the better. In all the classes the white ought to be clear and distinct, without blemish. Propagation is most readily accomplished by pipings (which are simply the tops of the shoots) struck under hand-glasses; very strong soils should not be used for the Pink, for too rich a compost only injures it and makes the colours run. The most suitable soil is a fresh loam, only ordinarily fertile—the top spit of a pasture with a fourth part cow-dung, and both thoroughly rotted together. Care should be used that there are no wire-worms in it, as they are very destructive, not only to the Pink, but also to the Carnation and Picotee. Where perfection is studied it is best to have nothing else in the same bed, which may be 12 inches deep, of the above-named material. Plant about the middle of August, about 8 inches apart, and make the soil somewhat solid around the neck of the plants, but do not bury too deeply. If dry weather should occur give a good soaking of water, but keep as dry as possible through the winter. Towards the middle of March stirring the soil and giving a top dressing will greatly invigorate the plants and assist the bloom. As the flower stems approach blooming, have in readiness a quantity of slender twigs, fix one to each plant, and tie loosely with soft thread. When the flowers begin to expand, if it is desired to have them quite perfect, examine the pods, and if they appear to be opening more on one side than the other, take a penknife and slit the closed divisions equally, but not so far as to let the petals fall down and out of place; at the same time tie a small bit of bast round, immediately under where slit; this will prevent "bursting," and keep the flower uniform in shape. If there be during blooming a thin covering of muslin fixed over the bed, and raised sufficiently high above the flower, so as not to rub them, the flowering will be considerably prolonged, and the colours much more distinct and clear. Where it is desirable to save seed, and keep the progeny in class character, each class ought to be kept separately, and the flowers assisted by artificial fertilisation, choosing those of the same class with good marking to hybridise with. The Pink is easily forced, and is a most desirable acquisition amongst early spring flowers. The care requisite to accomplish this object is very little. As soon as pipings can be had off forced plants, strike them in pots or pans in sand under a hand-glass in a gentle heat. After they have struck root gradually harden them off, and plant them out in well prepared beds, in which they will make strong plants ready for lifting and potting by October. Afterwards keep them in a cold frame. For forcing, the Pheasant's Eye—white with dark eye, Moss's Red, which is later than the last, and Paddington Pink, which is later still, are the best. In forcing them they may be placed near the glass, in any house where a temperature of 50° to 55° is kept at night. A Rose house is a very suitable place, but take care to keep them freely exposed to the sun, for in this is the main secret of success. Thus treated they may be had in bloom from the latter part of February, and I know of no flower that will give more satisfaction, or better repay the little extra trouble bestowed on it. *W. C.*

AURICULAS: *K.* The late hot weather has brought these on amazingly, and though there is a difference of 10 days in the time of flowering, according to the locality, whether in the northern or southern part of the country, still the same degree of attention is requisite. For instance, they must have abundance of air, and never be allowed to droop for want of water. It is a good plan to put two oyster shells on the surface of each pot, by which means the soil is not displaced when watering. Great care also should be taken to prevent the expanded blossoms coming in direct contact with the sun's rays; it is therefore advisable to have two or more frames in which to place the flowers according to their state of progress; for whilst expanded flowers must be shaded, later ones will require sun to bring them sufficiently forward for exhibition on the Auricula stage.

CARNATIONS: *Mary.* The soil which some of the best florists use for these flowers is the top spit of a meadow taken off long before it is wanted, and frequently turned, in order to clear it of wire worms: it is by no means heavy soil; the only addition it receives is about one barrowful of good decayed stable-manure to three of loam. Sufficient material for the following year is mixed every August.

DAHLIAS: *Amateur.* They should be hardened in frames, but at the same time endeavour to promote their growth as much as possible; for stunted, hide-bound plants never give satisfaction.

TULIPS: *E M.* These must be protected from the probable effects of hail-storms, which, as the buds are now getting forward, would otherwise be attended with very disastrous consequences.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Conservatory and other climbers should be frequently examined, to prevent a confused growth. Kennedyas, &c., if crowded, should have their shoots thinned. Climbers in pots will likewise require watching. The different Ipomœas and Thunbergias, being subject to red spider, should be well syringed, to prevent that pest gaining ground. Where a large quantity of hardy shrubs is annually forced, either to decorate the drawing-room or the conservatory, it is not desirable to pot a fresh stock each season, as a number of the deciduous shrubs, as Roses, Lilacs, Thorns, Honeysuckles, &c., may by proper treatment be made to bloom for several successive seasons; select, therefore, the most suitable plants, when removed from the houses, and give them some kind of temporary shelter, to gradually harden their foliage; those cramped for pot room, shift into a size larger pot, in rich turfy loam; towards the middle of the month plunge them in an open situation, in order that the wood may get ripe early; these plants, from having been previously forced, will bloom earlier than the new stock, of which a portion should each year be potted, to replace such as become useless for further work. Cut down and place in a cold frame the choicest Cinerarias for suckers, after they have done flowering, and put in a stock of Chrysanthemum cuttings for autumn display. As spring flowering plants for the stove and for cutting, we know of none more useful than Begonias. Now will be a good time to commence with a stock for next season's display; as they go out of bloom allow them a short rest, in a rather dry house, when they may be partially disrooted and repotted, pruning in any straggling shoots. Keep them close and syringe frequently, when they will soon commence growing. Abundance of light and a tolerable share of pot-room are necessary to insure fine plants. Above all, keep them a good distance apart, that the fine foliage of some of the species may have full room to expand. As the plants advance, liquid manure may now and then be given. Their period of blooming is from January to May.

FORCING DEPARTMENT.

PEACH-HOUSE.—The early house may now safely have an advance of temperature, by night as well as by day. At this stage they will bear forcing freely. Keep, however, the syringe at work twice or thrice daily; tie in the shoots as they advance, and expose the fruit to the free action of light, if a high colour is wanted. The borders should be kept well watered, but manure water will not be of much service to the early crop after this time. Bring on the succession houses by attending to the requisite culture, in accordance with their stages—for which see our former directions.

VINERY.—Although in a former Calendar we recommended, where very late Grapes were required, that the Vines should be retarded from breaking in the spring, yet it must be born in mind that after they have once started into growth the treatment must vary; for the most important part of the Vine's growth is comprised between that period and the setting of the fruit; and it is important for the formation of sound healthy wood, and perfect bunches, that they be assisted by artificial means during that stage. Hamburghs and the more hardy Grapes will require to be kept near 65° (as a night temperature), as they approach the time of flowering; but the Cannon Hall and common Muscat, with the Damascus and West's St. Peter's, will require an addditional 5° as they get into bloom; and this heat should be maintained till the berries are wholly set, when a slight diminution of temperature may take place, and the treatment be regulated by the time when the crop is wanted to ripen. Regulate the growing Vines, so as to keep them as evenly balanced as possible. To effect this it will sometimes be necessary to keep the lower spurs on a par with the uppermost ones, to allow them to grow for some time after the former ones are stopped; this will help to counteract the flow of sap upwards, and balance the growth of the tree.

FLOWER GARDEN AND SHRUBBERIES.

If not done previously, the herbaceous ground should now be well cleaned and neatly raked over. Fill up vacancies, either from the reserve ground, or by sowing annuals in the intermediate spaces. Large plants of some genera, as Phloxes, Asters, &c., generally throw up too many flowering shoots; where such is the case, thin them out at once, so as to obtain not only fine heads of bloom, but increased strength to the remaining shoots, to enable them to need less assistance from stakes. Hollyhocks for late blooming may still be planted; as it is better, where they are grown extensively, to plant at two or three times, to insure a succession of bloom. These showy plants are admirably adapted for planting in long lines, and parallel to straight walks, walls, &c., where they produce a grand effect. One of the principal points in pleasure ground scenery is the beauty of the turf, which should be kept at all times closely cut, if perfection is aimed at, but more particularly at this season, when, by frequent mowings, cutting the Grass as low as possible, the foundation of a close-bottomed turf will be laid for the season; on poor sandy or rocky soils the verdure must be maintained by occasional waterings with liquid manures.

KITCHEN GARDEN.

Seedling plants of Cauliflowers, Cabbage, &c., raised this present spring should be pricked off, when large enough to get stocky for final transplanting. As the future growth of the Brassica tribe depends much on not being drawn when young, some attention should be paid to this point when they are in the seedling state, for the best after-culture rarely compensates for the first neglect. As the time for sowing the principal crops of winter and spring Broccolies and Greens is now at hand, select, if possible, an open piece of ground, rather poor than rich; let the seed be sown thinly, and when large enough to handle, prick them out on a similar soil. To carry out the above directions, among the numerous varieties inserted in the seedsmen's lists, not more than three or four are necessary. A crop of the Globe Artichoke should now be planted for producing a late supply of heads. We have in former Calendars given directions for preparing ground for these and other permanent plants; on this the young side shoots taken from the old stools may be planted in lines 4 feet apart and 18 inches between the plants; or trenches may be dug 18 inches wide and the same in depth, in which some well rotted manure should be dug, and the plants put out as above.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the week ending April 13, 1854, as observed at the Horticultural Gardens.

April.	Month's Acc.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

April 7—Fine; very fine: clear at night.
— 8—Very fine throughout; clear at night.
— 9—Slight frost early A.M.; clear; very fine.
— 10—Foggy; cold haze; clear at night.
— 11—Very slight frost; hazy; fine; clear at night.
— 12—Very cold haze; fine; very dry air; partially overcast; slight shower.
— 13—Dry haze; fine; clear at night; frosty.
Mean temperature of the week, 2½ deg. above the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending April 15, 1854.

April.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 16	56.1	36.8	46.4	12	0.63 in.	6	5	5	1	3	3	2	3
Mon. 17	57.0	36.2	46.6	14	0.32	4	5	2	1	2	6	6	3
Tues. 18	57.3	37.0	47.1	13	0.49	4	5	3	1	3	5	5	3
Wed. 19	57.7	35.5	46.6	7	0.45	6	7	3	1	1	5	3	3
Thurs. 20	59.0	36.3	47.6	14	0.39	2	6	3	1	3	5	5	3
Friday 21	58.0	39.2	48.6	12	0.28	2	5	4	3	1	2	3	1
Satur. 22	58.8	39.1	48.9	15	0.32	3	7	4	2	1	3	5	2

The highest temperature during the above period occurred on the 22d, 1842—therm. 75 deg.; and the lowest on the 16th, 1847—therm. 20 deg.

Notices to Correspondents.

AQUILEGIAS: *A H.* It is evident from the letter-press of Aquileptoceras, in the "Botanical Register," that the plant there spoken of is wholly different from that figured in the "Botanical Magazine" t. 4407, under the same name. The first is a Russian species, so called by Fischer; the second is American, and was named by Nuttall. We have not time to inquire which name has priority. Such coincidences are not very uncommon.

CONIFERS: *Little Harriet.* You must not sow the cones! It is the seeds contained in the cones that must be extracted and committed to the soil. Sow them now in beds facing the south, in nice light loam, about a quarter of an inch deep. Cover the beds with a little straw, and watch them. As soon as you find the seeds coming up take the straw away.

CONSERVATORY: *J G.* We are sure that upon reflection you will agree with us in thinking that in our position we ought never to recommend tradesmen. You had better apply for plans and terms to those who advertise in our columns. They are all very respectable firms.

EFFECTS OF THE WINTER: *Windermere.* Thanks. We are anxious for as many returns as possible; but do not wish to have them earlier than the middle of May. It is our purpose then to consolidate them, if practicable.

FUNGI: *C J C.* There are no other descriptions of such plants than those you mention. A species not mentioned therein will probably be new. To such works as you possess there is little useful to add, except Corda's "Icones," Bulliard's "Herbier de la France," Sowerby's "British Fungi," Greville's "Cryptogamic Plants," and Bolton on Funguses.

HARTLEY'S ROUGH PLATE GLASS: *G W.* The specimen you have sent us is the right sort. ‡

NAMES OF FRUITS: *A W.* Your Apple is a middle-sized roundish fruit, glossy, brownish red next the sun; only fit for kitchen use. Its name, if it has ever had one, is not known.

NAMES OF PLANTS. *T G.* Pomaderris elliptica. — *Mary.* Andromeda axillaris. — *Uckfield.* Oncidium leucochilum; Cyrtochilum maculatum, a good variety; and Dendrobium crepidatum. — *A Z.* 1, Maxillaria Harrisoniæ; 2, Goniophlebium Catharinæ; 3, Pteris longifolia; 4, P. serrulata. *S.* — *G Y.* Ipomœa Quamoclit, a common tender annual.—*W D F.* Acer platanoides. — *F H S.* Pentlandia miniata.—*C., Inverness.* Luzula sylvatica, or pilosa, we cannot say which, from so young a specimen.

NATURAL GRAFTING: *S F D W.* Much obliged. We will examine it at our leisure.

PEARS: *Novice.* Your Passe Colmar and Beurré Rance, from an east wall, appear to have been gathered too early. On that aspect they should have been allowed to hang, weather permitting, till they parted from the spur by merely lifting up. Instead of this the stalk of the Passe Colmar has been broken off by twisting.

PROTECTING WALL TREES: *Enquirer.* Coping boards 9 inches wide have been found sufficient when there have been no more than 4° of frost; but, of course, canvas screens made to pull up and down from the coping boards would be preferable. You will find a plan of protection described in another column, which you may possibly wish to try. ‡

THE POTATO: *L S.* The Lazy-bed cultivation was that used in Ireland in 1845. We need not say that it wholly failed to produce the slightest advantage—the Lazy-beds having been worse, if possible, than any.

VINE LEAVES: *H G.* The small green excrescences on your leaves are perfectly harmless. They are merely enlargements of the pulp and skin of the leaves, caused by their having grown in an atmosphere too damp, and not skilfully ventilated. ‡

VINES: *J W J.* We are not aware that the Barbarossa is a shy setter. Nothing can be more perfect than the bunches which have come under our notice.

WATER: *M R.* Your plants are not likely to be injured by the water used for watering them being tempered with hot water taken from the iron boiler with which the houses are heated, the cold water being rain-water, and the boiler water rather hard.

WINDOW GARDENS: *B G H.* If well managed, such a place as you describe may be gay and pretty, provided you keep the plants quite clean, i. e. free of soot and dust.

TO MANURE MANUFACTURERS.

THE Directors of the Crystal Palace Company are prepared to exhibit in the Agricultural Department samples of MANURES and other substances applied to the Soil. The terms, &c., may be obtained on application to the above department at this office.—3, Adelaide Place, London Bridge, April 15.
G. GROVE, Secretary.

PERUVIAN GUANO, WARRANTED OF THE BEST DESCRIPTION, AND THE DIRECT IMPORTATION OF MESSRS. ANTONY GIBBS & SONS; LAWES'S *Patent Superphosphate, Nitrate of Soda, Bone Dust, and all other Natural and Artificial Manures, at the lowest remunerative prices.*—*See* RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY," to be obtained from W. E. RENDLE & Co., Seed Merchants, Plymouth.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

SEWAGE GUANO, 5*l.* 5*s.* per ton (bags included). Circulars and Testimonials forwarded on application.

DEODORIZING CHARCOAL, 11. 10*s.* per ton (bags to be returned). Terms: Cash on delivery.
The Manchester Sewage Guano Company, 3, Watling Street, Shudehill, Manchester.
E. RANSBOTTOM, Agent.
JOHN THOMPSON, Secretary.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.
Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

TOP DRESSING.

THE "ECONOMICAL MANURE."—A complete and by far the cheapest substitute for Guano. 1¼ to 1½ cwt. per acre of this powerful Manure, costing 15*s.* to 18*s.*, is ample (more must not be used), and equals 3 cwt. of the best Peruvian Guano, thus saving at least 50 per cent., besides carriage, &c. Hundreds of Testimonials from all parts of England, Scotland, and Wales, France, Belgium, and Spain, prove this, and show that it gave most wonderful results last year on every soil, as well on grain and grass as on root crops, far surpassing the expectations of the purchasers. Price 12*s.* per cwt., packages included, and delivered free on rail or wharf in London. Testimonials, directions for use, and all particulars, to be had gratis at the British Economical Manure Company's Offices, 10, Mark Lane, London, or sent on applying to
BENJAMIN COVENEY, Manager.
N.B—This Manure, unlike Guano and artificial Manures generally, does not require rain to render it effective. Sown broadcast and left on the surface (the best way of using it) it will not lose its virtue, and has the peculiar property of attracting sufficient moisture from the atmosphere.
Good Agents wanted. An allowance to the Trade.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.
"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.
Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
Soluble	16.10	
Insoluble	19.17	
Sulphate of Lime, &c.		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. NESBIT."
For price and full particulars, apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.
Agents wanted in all the principal towns.

REAPING MACHINE COMPETITION AT STIRLING. The STIRLING GENERAL AGRICULTURAL ASSOCIATION hereby offer the following PREMIUMS to be competed for during next harvest:—
1st, For the most approved Reaping Machine, of any price, 20*l.*;
2d, For the most approved Machine, not exceeding 25 guineas in price, 20*l.*
Should the judges fix on a Machine of 25 guineas, or under, to be the best on the field, it will thereby be entitled to both prizes.
The price and simplicity of construction of all the machines will be taken into consideration in awarding the Premiums, but the Society reserves the power of withholding the Premiums, if, in the opinion of the Judges, the Machines are not of sufficient merit.
Intending competitors will require to enter with Mr. Hutton, their Secretary, at Stirling, not later than the 20th of July next, when they will have due notice of the time and place of competition forwarded to them.
Intending competitors must forward with their notice of entry the sum of 2*l.* sterling, to be returned on the morning of trial to those who appear on the field of competition with their Machines.
The Machines are to be tried on all kinds of crop, and upon both Dryfield and Kerse Lands, if required. The trials to be continued until the Judges and Committee appointed by the Association are satisfied.
Machine-makers entering Machines are to state what price they will furnish such machines as they compete with to members of the Association, and Farmers entering are to state the price they paid for those they compete with. By order of the committee.
WM. HUTTON, } Joint
WM. FORRESTER, } Secs.
Stirling, March 17, 1854.

RYE-GRASS SEED.

	Per bushel.—*s.*	*d.*
1. True Italian Rye-grass (imported seed)	... ...	6 6
2. " (English saved)	... ...	5 6
3. " (Sutton's improved Italian)	... ...	7 0
4. " (Dickenson's improved Italian)	... ...	6 6
5. Perennial Rye-grass (Lolium perenne)	5*s.* 6*d.* to	6 6
6. Pacey's Perennial Rye-grass, extra fine	... ...	6 6
7. Stickney's Perennial Rye-grass	... ...	6 6
8. Evergreen Rye-grass, true and excellent	... ...	6 6
9. Annual Rye-grass, or Common Ray, for husbandry	alternate 3*s.* 6*d.* to	5 0

We believe there are as many varieties of Italian as of English Rye-grass; and after many trials in our sample ground, we have selected one variety as decidedly preferable to others, and for distinction have termed it SUTTON'S IMPROVED ITALIAN RYE-GRASS (No. 3, see above.) Quantity to sow an acre, 2½ bushels.
DICKENSON'S is also a good kind; we obtained our stock of this sort to grow from direct from Mr. Dickenson, of May Fair.
SUTTON AND SONS, Seed Growers, Reading, Berks.

GRAND POULTRY SHOW AT BATH, JUNE 7th, 8th, and 9th. In connection with the Bath and West of England Agricultural Society, but with a separate entrance and subscription.
Director and Steward—JONATHAN GRAY, Esq.
The Honorary Secretary will forward Prize Lists and Certificates of Entry on application.
All Certificates must be returned to him on or before the 10th of May, or Exhibitors will be excluded.
All Advertisements for the Catalogue must be forwarded to him by the 10th of May.
By the kind liberality of the Great Western, the Bristol and Exeter, and South Devon Railway Companies, all Poultry will be taken to and fro free of carriage, provided the same are not sold.
HENRY SPACKMAN, Honorary Secretary, 6, Terrace Walk, Bath.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

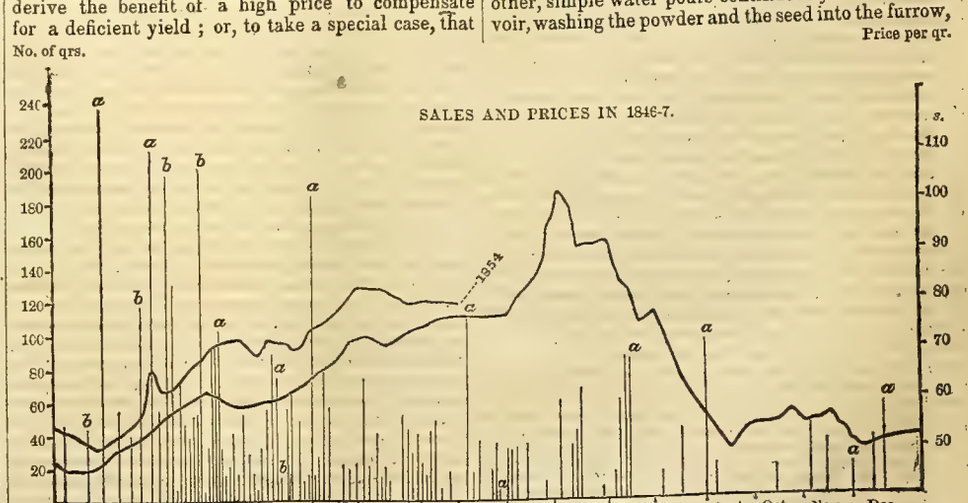
The Agricultural Gazette.

SATURDAY, APRIL 15, 1854.

ONE of the speakers at the recent discussion upon AGRICULTURAL STATISTICS before the Society of Arts referred to the ignorance which prevailed on the subject of our supplies of food as one of the stimulants to enterprise; so that our granaries and warehouses were stored with extra abundance by our corn importers, and the country saved from risk of famine with extra security. Among the letters received from correspondents on this subject, we can refer to some which argue, with this gentleman, for the advantage of being in the dark on the state of the national store-room, but on altogether different grounds; because, indeed, *information* would induce excessive importation, and so cheapen Wheat. Now, we believe both to be in error in their anticipated results of statistical information, and both especially to be in error as to the mode in which it will lead to the results which may be expected from it.

It is more especially to objections of the latter class that we would direct attention, the aspect in which the scheme stands to the agriculturist being that in which we are especially interested; and its consistency with the general interests of the nation being, we suppose, universally admitted.

It is urged that the knowledge of our deficiencies immediately after harvest would enable importers to supply them exactly, and so farmers would not derive the benefit of a high price to compensate for a deficient yield; or, to take a special case, that



if full information had been published last September on the extent and yield of the crop, compared with previous years, merchants would have imported the corn of Russia, America, &c., in quantity sufficient to lower the price to 20*s.* or 22*s.* per bag; and where, then, would our English farmers have been "with Wheat, 10 or 12 bushels per acre on the clay land, and 20 bushels per acre on the sand?"

Now, the answer to the particular case is that Wheat could not, we believe, have been purchased in Russia, or elsewhere, except at prices about or above those here named; and the reply to the general proposition, which, after all, is the most deserving attention, is obvious enough. At present, importers are guided by an *opinion*, and their trade is a hazardous *speculation*; but in the case supposed, they would be guided by facts, and the trade would be perfectly safe; and if safe for them, as merchants, then safe also for us as growers; for it is assumed by those who think otherwise, that these merchants are, at present, liable to error only on the side of a too limited importation, which is just begging the whole question under discussion.

In the autumn of 1847 how many merchants were ruined and how rapid the fall of prices, are facts within the memory of all; but it seems to be forgotten that this injury to commerce, this injury to agriculture, was simply the result of ignorant fear, and consequent excessive importation. The ignorance which trustworthy information on our crops would remove is quite as injurious to the agriculturist as to the merchant; and it is especially injurious to the former, not only because it guides him erroneously in the sale of his produce, as our diagram, which we republish, and which we explained last week, sufficiently shows, but also because the blunders of the latter, to which it gives rise, fall in their mischievous effects upon the shoulders of both.

It is objected that this diagram of 1846-7 teaches nothing, because that was the season of the Potato rot, whose full effect no statistical information could have made known. We contend, nevertheless, that it teaches much, and among other things *this*—that ignorance, whether removable or not, is a source of great injury both to commercial and agricultural interests. No one disputes that this great wave of price rose much higher than it had any occasion to do, and by the enormous importation which it excited, subsequently fell much lower than it would otherwise have done. And if any one is thus forced to admit the general truth that the ignorance which produced this unreasonable panic, this electric sympathy with the fears and the prices, equally ignorant, of other countries—that this ignorance, *whether removable or not*, was most mischievous; then must he also admit that to the extent to which it is removable, it ought to be removed.

A GOOD deal of useful information was given at the meeting last week, of the Central Farmer's Club, upon the very important subject of applying MANURE in a liquid state. Mr. SPOONER, of Southampton, who opened the discussion, described the machines which have been employed for this purpose—CHANDLER'S liquid manure drill and his own, both of which were exhibited at Gloucester. The former is liable, by the settlement (during rest when turning at every land's end) of the manure which it delivers, to distribute muddy sediment at first, and comparatively poor liquid towards the end of each journey across the field, an unevenness which necessarily tells against its efficiency.* In Mr. SPOONER'S, two entirely distinct parts act separately: by the one, the manure, whatever it be, is delivered as from a drill in the ordinary way; and, by the other, simple water pours continuously from a reservoir, washing the powder and the seed into the furrow, and giving the latter that moist seed-bed which it requires, along with a sufficiency and uniform supply of nourishing food for the young plant as soon as it shall germinate. The efficiency of these water drills was proved by the evidence of Mr. RUSTON, of Chatteris, who gave the following facts in reference

* It is only fair to add that Mr. HOWARD, of Bedford, a subsequent speaker, stated on this point that he had visited several farms where CHANDLER'S drill was in use, and had seen several crops grown after it, without having discovered this defect, namely, that at the ends more manure was put into the soil than at the middle. The most even crops had, to his knowledge, been grown after it.

to the relative merits of the dry and water drills (CHANDLER'S).

Experiment.	Quantities of Manure per acre.	When sown.	When weighed	Weight per acre.	Cost per acre of Artificial Manure.
				ton. cwt.	s. d.
1	10 loads of yard manure, 2 bush. dissolved bones, sown with liquid drill	June 17	Nov. 15	22 15	14 0
2	10 loads of yard manure, 6 bush bones, 12 bush ashes, sown with dry drill	June 18	Nov. 15	17 1	15 0
3	2 bush. bones dissolved and sown with liquid drill. No yard manure.	June 24	Nov. 15	18 15	14 0

If such results as these, he said, were produced by the adoption of the liquid manure-drill, surely it was worthy the attention of every root-growing farmer.

The general concurrence of the club in this opinion was expressed in the following resolution:

"That it is very desirable, in the sowing of Turnips or Mangold Wurzel, that vegetation should commence as soon as possible after the seed is committed to the earth. That the water drill, by supplying moisture as well as manure, secures this desideratum."

And on the other head of the discussion it was resolved "that it is equally profitable to apply liquefied manure to Grass crops:" for the greater part of the attention of the meeting was given to the question whether it is possible and profitable to apply the general manure of the farm in a liquid form over the surface by steam-power.

Mr. SPOONER referred at considerable length to the experience of Mr. TELFER and others on this subject, as bearing more especially on the increase by this means of food for cattle. He observed that "it is far more profitable to apply liquid manure to the Grasses than to other kinds of crops. In many instances the crop of Grass, particularly of Italian Rye-grass, has been much more than quadrupled. Fourteen feet have been obtained by successive cuttings. We cannot expect to make as large an increase in corn crops as in Grass crops. To whatever extent we may apply manure, it appears impossible to double our corn crops, whereas there seems hardly any limit to the increase we can secure in Grass crops."

On the question of cost Mr. C. JOHNSON stated that 2000 tons of water, equal to 20 inches of rain per acre, might be raised 20 feet by an expenditure of 5*s.* in coals, and force enough was thus to be obtained for its distribution by gravity over the surface.

Mr. MECHI stated his experience at Tiptree to continue perfectly satisfactory on the question of cost and effect. We conclude with a few of his remarks on the subject:—

"Let them just compare the application to the land of liquid manure, and the application of solid. They carried out a certain number of loads of dry manure at a cost of 6*d.* per ton per mile. They had then to spread it and plough it in. They next had to wait for rain to wash it into the soil; and probably the rain, when it came at that particular part of the summer, was barely enough to carry it down two or three inches. But by means of the system of irrigation, what took place? The manure which fell from the animals to-day was washed into the tank to-morrow, conveyed on to the land, and ploughed in a depth of three, four, or five feet, at a cost of something like five-farthings or three halfpence a ton. In putting on the liquid manure, the ground was saturated to the extent of three, four, or five feet. He termed it 'ploughing in,' because it penetrated the soil according to the depth of the drains. If they could put a ton of manure in a liquid state, anywhere within a mile, for five-farthings or three halfpence, deeply in the soil, surely it was far cheaper than doing the work with horse and cart. The use of liquid manure enabled the farmer to do this. After Tares, he might put in his Turnips, as he had done last year early in July, on what was naturally a very barren soil, and upon which he had grown 23 tons of white Turnips per acre, and 19 tons of Swedes per acre. They were put close, certainly; but they were considered much better than the crops in the neighbourhood raised from solid farm-yard dung. The result was highly profitable, for he had had no carting of solid manure. On all kinds of green crops he believed the system would prove beneficial; and the best proof of that was, that where it was adopted double the amount of live stock might be kept per acre, without any additional expenditure for the purchase of artificial food. One of the great tests of successful farming was the amount of live stock that a man could maintain on a given number of acres. His own apparatus cost him 4*l.* 5*s.* an acre, including everything; but at that time iron was much cheaper than it is now. But if they expended 6*l.* an acre, and charged themselves 7½ per cent., and also the working expenses in coal, they would still be considerable gainers. Their horses would be at their service for ploughing and other work, instead of carting out manure, which had then to be spread over the land, and bringing the empty carts back again. It had this advantage, also, that all kinds of Grasses would be brought forward more rapidly in the spring, and continue their growth late in the autumn; so that in his own case, while many of his neighbours were short of food, he had an abundance. The question under discussion had an important bearing on the sewage of our towns and the waste of manure which daily occurred. They were now almost crying about the supplies of guano, which was nothing more than bird's dung; but if farmers, and landlords, and the inhabitants of towns were so inclined, there could be no practical difficulty in effecting the conveyance of the sewage of towns to the fructification of the country."

THE MANAGEMENT OF FORWARD EWES AND LAMBS.

THERE is no portion of farming economy more important than that part which relates to the management of sheep stock, and it may also be said that none will prove more profitable, when constant care and unremitting attention is bestowed upon it. But sheep farming embraces a considerable variety, with regard to breed, age, and sex. I therefore propose, in this paper, to confine my remarks to the management of forward ewes, and the rearing and fatting of early lambs; and I hold this to be the most difficult point in the whole routine of sheep management, requiring, as it does, great judgment, experience, and foresight, coupled with the most vigilant superintendence.

I do not propose, in the present instance, to treat of the method of rearing and feeding house lambs, but strictly confine my remarks to the method of management necessary for the feeding and rearing of ewes and lambs of the best quality in the open field. This kind of stock is best calculated for arable farms of the southern counties; for although many portions of the kingdom produce feed of all sorts, of the best quality, yet such is the influence of climate upon the rearing and fatting of early lambs, that it would not be advantageous to rear them upon cold and bleak situations. All kinds of sheep, when fatting, require the best food which can be obtained, but in the case of early ewes and lambs, a provision must be made in an exceptional manner, having regard not to one kind of food only, but to every kind which the land can be made to produce, and adapted for the purpose, in order that a great variety as well as abundance may be available. I therefore propose that, in addition to the ordinary produce of sheep's food upon the farm, the Italian Rye-grass should be grown in the Wheat or Oat eddishes, upon all that portion not required for tillage between the months of September and December. This is done by seeding the corn land in the month of March. A portion of white Carrots should also be grown in lieu of, or in addition to, the Turnip crop; Mangold Wurzel may also be grown to some extent, as it is found very excellent food late in the spring, when the Swedes begin to lose their feeding properties. The breed of sheep kept for the rearing of early lambs is the horned Dorset, peculiar to the counties of Dorset and Somerset; we, however, sometimes meet with flocks of the same breed without horns, but they are quite an exception, and were originally propagated from the same stock. Early lambs are occasionally obtained from the Southdowns and other breeds, but after many years' futile attempts to obtain the early lambs as a rule from these breeds, it is now considered quite a hopeless case, and the horned Dorset is the only breed which can be depended upon for that purpose.

In selecting ewes of the horned variety, it is requisite that they should have been put to a Southdown tup, and by all means chosen of good quality, being well made, short legged, and clothed with fine wool. This breed of sheep has been greatly improved in quality and symmetry within the last 15 or 20 years; but the number of flocks has been much diminished, having given place to the Southdowns upon the hill farms and in exposed situations. Formerly many flocks of these horned ewes were propagated almost entirely with regard to their milking qualities and propensity to produce twin lambs, in doing which the shape of the animal was comparatively disregarded. We still meet with flocks reared in the same manner at the present day; hence the necessity of the before-named selection. During the last 26 years I have continued to keep this breed of sheep, and I have found in some seasons, when my ewes have been ill-shaped, that they have yeaned an immense number of lambs, and have proved very milky, and made lambs of the first quality; they would not, however, fatten whilst suckling their lambs. At other times, when I have obtained the choicest description of horned ewes from the best districts of Somersetshire, I have found that they not only brought a large number of lambs, but that the ewes and lambs would both become fat and fit for sale at the same time, and in first-rate condition.

These ewes are sometimes sold in the spring of the year; but the usual period at which the breeders of this kind of stock offer them for sale is at Michaelmas, just before the time of lambing. Since, however, the numbers of flocks have been diminished, they have become comparatively dear, and it is therefore a common practice for some graziers to purchase and keep over for breeding purposes, the second year, those ewes which may, from circumstances, be found poor, or in merely stock condition in the spring of the year. The plan of breeding from the ewes the second season is found to answer a good purpose upon small arable farms, having but little pasture land attached—it being the best policy to keep a stock flock in the summer, and a fatting flock in winter; for it must be borne in mind that this kind of sheep does not fatten readily during the summer months in the enclosed districts of the southern counties, because they feel the annoyance of flies more than most other breeds. The custom is to turn the tup with the ewes the first week in May; a short, fine-woolled sheep should be selected, in order that the offspring, more particularly in the case of twin lambs, which generally require to be kept a longer period, may possess a close coat, it being well known that loose hollow wool prejudices the sale of lambs in the live market. The tup should also possess good symmetry and plenty of flesh; a well-bred Hampshire down I have found better than a pure bred Sussex down, for the lambs reared from the latter do not possess a due proportion of lean meat, whereas those produced from the former are highly esteemed by the consumers of the present day, affording, as they do, a well combined proportion of flesh and fat.

The rams should be shorn about a fortnight previous to being turned among the ewes, and kept in an open shed up to that time, in order that they may gradually become accustomed to the loss of their coats; otherwise, in case of their being turned into the open field when recently shorn, they suffer much in health and condition during the night frosts, which often happen in the early part of the month of May. When these ewes are kept entirely for the purpose of producing early lambs, they should never be shorn until the rams are taken from them, which should be done about the 20th of June; in that case the portion of the flock of ewes which proved to be pregnant would finish dropping their lambs about the 14th of November. It is not advisable, in a flock of early stock, to have lambs fall after that period; for in case of ewes lambing later, they do not fatten readily with their lambs by their sides.

The manner of keeping the ewes must now be considered, as it will most probably have its influence in inducing the ewes to offer to the ram at the earliest time. Although the nature of this breed of sheep will go far in this respect, yet circumstances often arise, such as the state of the weather, to delay the breeding season; yet this may in a great measure be prevented by generous keeping, and by choosing a warm and sheltered situation for feeding them. I have found at this particular period the best way to bring the ewes forward to the ram is to feed them upon Trifolium and cut Swedes, or Mangold, placed in troughs, having also a change, or run upon dry pasture for a few hours during the day; but if the ewes are further delayed in their season, it is a good plan to give them about half a pint of Beans each per day, which will generally produce the desired object. It will at all events bring them forward in condition; and that portion of the flock which may not prove in lamb will be the sooner fit for the market. After the rams are removed from the flock, and the ewes ascertained to be with lamb, it will be best not to keep them too high; it is, however, desirable that they should have two or three changes of keep during the day, but not of luxuriant or rich arable Grass. A dry pasture, or a change to a fold of Tares or similar food, would be most suitable; and they should, indeed, from this period up to the time of lambing, be managed as a stock or store flock, the object being to keep numbers and to feed the land bare, for the sake of the manure. The travelling consequent upon their removal for change of food will also prove beneficial, for it is admitted by all flock-masters that the ewes and their offspring will be more healthy when the former have received a moderate amount of exercise during the period of pregnancy. Having now brought the management of the ewes down to the period of lambing, I would observe that the risk or probability of loss is much less than it is with later stock when the lambing season occurs in the months of December or January. In general it is unnecessary to resort to the lambing-yard or "dead-fold," by reason of the comparative mildness of the weather (peculiar to our climate) during the month of October and early part of November. On the other hand, it is not advisable, as is too often the practice, to allow the ewes to roam at large during the night-time, as those about to yean are too apt to stray away from the main part of the flock, and their lambs are often lost, or found dead under untoward circumstances. The shepherd may be diligent and attentive, yet it is almost impossible for him to find the ewes which most need his assistance in a dark night, when they are allowed to lie promiscuously over a whole field. I therefore recommend that a shifting fold should be used, being placed on the driest and most sheltered part of the field, and removed on to fresh ground every day. By this means the animals lie on clean land, which, with shelter, will contribute greatly to their health and well-doing; and will, at the same time, enable the shepherd to attend to those ewes which may require assistance; for in the darkest night, when provided with a lanthorn, he will be able to discern them all; nor can the young lambs, when they fall, escape his observation.

By this mode of proceeding, the shepherd can at every visit remove all those ewes and lambs which require such care to a place of greater security; for it often happens, when we get a heavy rain, that it is necessary to take them to a hovel or covered shed. When the lambs are perfectly strong, and the ewes healthy, it will not be necessary to put them under cover; for should the weather be very wet, it is generally mild at the same time, and I have usually found them do well thus managed, when they have been well kept.

(*To be concluded next week.*)

AGRICULTURAL METEOROLOGY.

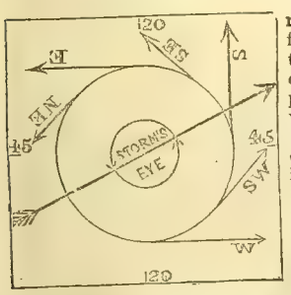
(*Continued from page* 225.)

III. Assuming this storm of the 25th-26th August to be rotatory and progressive, I supposed it to have passed between England and Ireland, crossing this island in an easterly or north-easterly direction. For the facility of reference, the diagrams are repeated in their proper relative position; and the smaller one represents the storm's eye as it was approaching these islands, and beginning to affect the barometer of Scilly light-house about noon of the 24th. The arrow of this diagram represents the track of the storm, or *axis*, as it is technically called, being the symbol most commonly used for this purpose.

If this axis, then, did not travel along the line I have suggested, it must have passed to the south of England, *i. e.*, along the British Channel, which, for reasons I will presently give, was totally impossible; or it must have passed to the westward of Ireland, which I thought extremely unlikely—firstly, because in that case the depression of my barometer would not have been so great as it was; and, secondly, the fall of rain would have discontinued much sooner.

Firstly (although hitherto no absolute standard has been ascertained for measuring the area of rotatory storms), the depression of the barometer is seldom found to exceed an inch in any of those gales which have been traced over these islands. Those of your readers who have had access to the works of Sir William Reid, or of Mr. Thom, will recollect the barometrical diagrams given by those gentlemen to illustrate this branch of science. In the course of my remarks I hope to add one for this purpose, which for the present I must postpone; but if the barometer fell three-fourths of an inch (.75) in England, from the effect of a storm passing to the westward of Ireland, it is certain that near the centre of the storm the depression of the barometer must have considerably exceeded an inch.

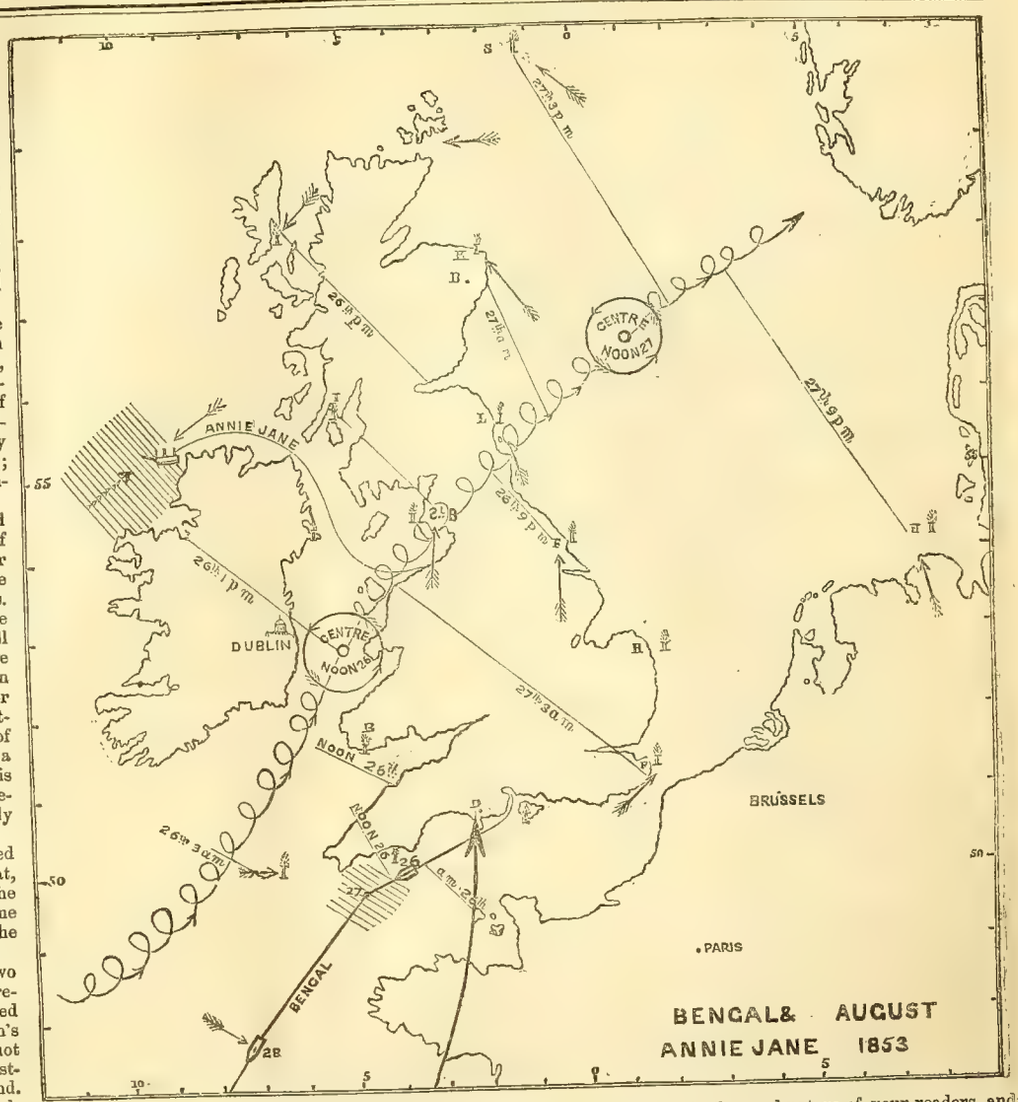
Secondly, in most storms that have been traced to the westward of Ireland, it has been found that, as soon as ever the barometer begins to rise, the wind flies round to the north-west, and fine weather immediately ensues, which was not the case in this instance.



For these two reasons, therefore, I inferred that the storm's centre did not pass to the westward of Ireland.

That my readers may see how impossible it was that it could have passed up the English Channel, I shall ask them to move the small diagram up the Channel, and they will perceive that, as soon as the storm's eye arrives between Cherbourg and Portland, the wind (as indicated by the centrifugal arrows) will begin to change from South to S.E.; and, as the diagram is moved along, the wind will further change to East and N.E. But as the wind, during the 25th-27th August, changed from South to S.W. and W., it is evident the storm's centre did not pass to the south of England. I therefore infer it to have passed between England and Ireland.

The next question was, in which direction did it extricate itself from the *cul-de-sac* formed by the hills of Wales and Lancashire to the eastward, by the Cheviots and Western Highlands to the northward, and by the hills of Ulster to the westward? I have stated my opinion to have been "that, from the length of time the storm lasted, it must have crossed this island in an easterly or north-easterly direction." If your readers will take their compasses once more and describe a circle, with London for a centre, they will see that from 3 A.M. of the 26th, when it was nearest to Scilly, until 9 P.M. of the 26th, when it was nearest to Flamborough Head on the coast of Yorkshire, the storm was travelling very nearly along the arc of a circle, of which London would be the centre. This will explain why its influence continued to be felt so much longer than would have been the case, had the storm travelled right away up the valley of the Caledonian canal, or even up that of the Clyde and Forth. I may add, that all inquiry tends to confirm the principle that storms, whilst recurving, progress at a much slower rate than whilst advancing along a straight track; and this is found to hold true whether within or without the Tropics.



I must trust to the good-nature of your readers, and to your well-known liberality, to excuse me for intruding these diagrams a second time on their patience; but, in the discussion of a great law of Nature, and in the elucidation of such important principles, I feel that I rely justly on your sympathy:

> "Segnius irritant animos demissa per aures,
> Quam quæ sunt oculis subjecta fidelibus."

I have dwelt at the greater length on the foregoing explanation, because your correspondent "R." says "he has been unable to trace a single storm which could be explained on such a supposition" (p. 170), viz., "the opinion I had advanced (p. 155), that Mr. Redfield's '*Rotatory Theory*' was of universal application." I shall next proceed to give the substance of the details I have since been able to collect, which appear to me to establish the correctness of the track I assigned to this storm at the time of its occurrence.

Home Correspondence.

Cheap Whole Flour Bread.—The present high price of provisions is felt by no class more severely than by the labouring agricultural population; and I observe that the diffusion among them of modes whereby they may husband their resources of food, is one of the topics of the day. I shall endeavour to give some aid in this by stating the result of an economical system of bread making followed in my family for some months. The tailings of Wheat are sent to the mill, ground into flour, and returned with the loss of only about 6 per cent. in weight, being moisture evaporated in the milling process. This flour is made into dough with buttermilk instead of water. A dessert-spoonful of carbonate of soda is mixed with a portion of the milk, and a little yeast added, with salt to taste. This leavens the lump in a few minutes; it is at once shaped out into loaves, and put into the kitchen oven, from which it is taken in rather less than an hour in the form of wholesome brown bread, pleasing to the palate and easy of digestion. The cost stands thus:—A bushel of tailings, weighing 57 lbs., gave a return of 54 lbs. flour; value of Wheat, 7*s.* 6*d.*; milling and cartage, 6*d.* = 8*s.* A baking of 6 lbs. flour at this rate costs 10½*d.*; half gallon buttermilk, 3*d.*; yeast, carbonate of soda, and salt, 1½*d.*; total, 1*s.* 3*d.* From this is produced 10½ lbs. bread, which costs 1½*d.* per lb., say 5*d.* for the 4 lb. loaf! The labour of making is scarcely worth reckoning, being an act of pleasing housewifery to one of the family. The oven of the cooking stove is, ordinarily, hot enough to fire the bread put into it. Thus there is no expense for the item of firing. It is true that an ordinary cottager seldom has an oven; but he certainly ought to have one even for the daily purposes of cookery, and its cost would be made up by the savings on a very few weeks' loaves made as above. But, it may be said, all cannot have tailings. True; but even in the event of using full weight Wheat at 10*s.* 6*d.* per bushel, we should add but 1*d.* per loaf to the cost above stated; for a bushel of 63 lbs. Wheat, costing, including milling, 11*s.*, gives 60 lbs. flour; *i.e.* 1*s.* 1*d.* instead of 10½*d.* as above for the 6 lbs. flour required to make two and a half 4 lb. loaves. Thus, by following the simple process I have described, every one, from the Queen to the cottager, may, even in the present dear times, command a quartern loaf for 6*d.*! I will not promise that it shall be so nutritious as my 5*d.* loaf; for chemistry, by one of its latest and best expounders, teaches us that "the tail corn which the farmer separates before bringing his grain to market, and usually grinds for his own use, is richer in gluten than the plump full-grown grain, and is therefore more nutritious." By the way, this is another proof that we farmers don't enough prize our blessings; for here we learn that what we were wont to consider a grievance, the consuming at home of our inferior grains, has really been one of the causes of the goodly development of thews and sinews which marks the tenant farmer class. *S.*

Ammonia in Putrefaction of Grass, and its uses in Vegetation.—In acknowledgment to "J. H. H.," in No. 13 (page 203 *c*), as it can hardly be supposed that he may have mistaken the smell of ammonia, I can only express surprise that it should have been sensible under such conditions. That ammonia is produced is fully probable, as Grass (without Clover) may be taken to contain 1-4th per cent. of nitrogen; but that it should have been sufficient to neutralise all the acids, and emit its odour in excess, is not so easy to account for, unless it lay on a limy floor, or bed, which would take acid and set ammonia free. That the hydrogenous gases disengaged in the fermentation should have taken nitrogen from the air to form ammonia is hardly consistent with the known fact of the self-conversion of ammonia into nitric acid, by fermentation in the air in an alcalescent heap: if the heap had been, as might have been expected, acidulous, this would have been in common course, but then there could have been no smell of ammonia. Nor did I allude to carbonic acid only. Others of more decided properties are produced in the fermentation of vegetable juices (as present in green Grass), modifications, perhaps, of acetic acid, containing carbon, hydrogen, and oxygen united, as some of the offensive gases eliminated in the fermentation. In reference to his previous letter of March 9 (p. 139), in support of the hypothesis that ammonia acts rather by the supply of hydrogen than of nitrogen, we may observe, in passing, that as carbonic acid is absorbed and oxygen given out in vegetation, this oxygen may come from either the carbonic acid or the water present, the latter being as easy of decomposition as the former; but the fact of the woody fibre and the chief bulk of vegetable matter containing the hydrogen and oxygen in the proportions of water, seem to indicate not exactly decomposition, but their entering together into union with the carbon, under the action of vital chemistry, which produces compounds different from those effected by common affinity, and expelling the oxygen of the carbonic acid. That

in the fertilising reaction of ammonia, the hydrogen, as well as the nitrogen, is assimilated, will probably not be doubted; but when we consider that Grass (to take J. H. H.'s example) contains only 0·25 per cent. nitrogen = 0·3 ammonia, but 0·83 per cent. hydrogen = 14 ammonia, and consequently that an acre of green Grass (say 10 tons) 22,400 lbs. would require 224 × 14 lbs. = 3136 lbs. of ammonia to supply the hydrogen, contrasted with 224 × 0·3 = 67.2 lbs. to supply the nitrogen, probabilities will appear strong in favour of the latter; and the analogy of action in nitrate of soda, exemplified in Dr. Anderson's address in No. 13 (204 *c*, at foot), the nitrate being the more effective of the two, the intense green that both alike produce; and further, that plants will grow in pure sand and water, and assimilate large quantities of hydrogen, by aid of very little nitrate of soda, and no ammonia, the inference appears hardly questionable that the hydrogen is supplied by the water, and that the ammonia acts by supplying nitrogen, partly for sustenance of the plant, and perhaps also for exciting its growth, in a way somewhat analogous to stimulation. Prof. Johnston says (Lectures, p. 37, 2d edit.) that hay contains 5 per cent. hydrogen, and 1·5 per cent. nitrogen, and that it requires 600 lbs. of fresh Grass to make 100 lbs. hay. *J. Prideaux, Plymouth.*

Stoppage of Drains.—I have lately been much interested by the perusal of the communications of several correspondents on this subject, and as I am a sufferer, though from a different cause to any I have seen stated, I take the liberty of laying my case before you, and shall be much obliged by the suggestion of a remedy.

have on my farm, a 20 acre piece of boggy land, which, when I came in possession in 1851, was in a most wretched state, and as full of water as it was possible for land to be. My landlord, Sir W. W. Wynne, Bart., consented to drain it for me, and accordingly Mr. John Green (an experienced person whom he employs) and his staff were sent over to commence operations. The main drain or outlet was put in 600 or 700 yards in a straight line with double tiles, forming a culvert for the water, 11½ by 5½ inches, and from 6 to 9 feet deep; from this several other mains were put in, in other directions, to tap the banks of the elevated ground adjoining, the principal main being of the same sized tiles, with others of 6-inch and 4-inch pipes, with furrow drains of 3-inch and 2-inch pipes, tapping the banks 10, 12, and in some places 16 feet deep. All went on very satisfactorily, and the undertaking was perfectly successful, the large main culvert discharging at a furious rate two-thirds full of water, and the land by the spring of 1852 had become quite sound and dry, and continued so until the thaw of the great fall of snow we had in the beginning of January last, when one day walking across the land I found that there was a stoppage in one of the drains, I sent over to Mr. Green, but we found the land so charged with water that the attempt at examination was suspended, but eventually it was found that the large culvert was half filled with a yellow deposit, same as enclosed sample, and although perfectly slimy and loose in the pots, it had formed in such quantity as to stop the large stream of water in the mains. Orders were given to open holes at 20 yards distance from each other, a cord was lowered by the stream from one hole to the other, a sweeper was attached to the cord, formed of Holly or Gorse, and by this means, with a deal of trouble, all the main drains were cleaned, the furrow drains were poked with long rods fastened together, and thus all were put in good working order again. The liquor from which the deposit forms oozes out of the land in many places, about 1 or 2 feet above the pipes in the drains, and I find that some of the 4-inch pipes that were made quite clean about a month ago, have already three-quarters of an inch thick of this yellow substance, which I have inclosed, formed, and settled in them. It is proposed to make brick holes similar to pump wells, say 2 feet 8 in. diameter, frequently along the mains so as to be able to examine and brush them (as described above) when we find it necessary; but the question, and what we wish to arrive at is, what is the nature of the deposit? Is it likely that it will percolate out of the land (where I presume it has been pent up for very many years) in a year or two, or will it in your opinion continue to harass us for some length of time? Your opinion on this will confer a great favour on *Bernard Lewis.* [The deposit is no doubt ferruginous, and of the kind indicated by Mr. Parkes in his Newcastle lecture. Rain water will dissolve oxide of iron in a vegetable soil, but the carbonate of the protoxide of iron, which is thus held in solution, is decomposed on coming in contact with the air in the drain—the iron assumes a higher state of oxidation, which it could not do in the vegetable soil—and the peroxide thus formed, being insoluble in water, is deposited, and fills up the drain. The remedy is by persevering exposure to the air (and by the application of lime, which will "engage" all the acids likely to dissolve it and carry it into the drains), to facilitate the perfect oxidation of the mischievous protoxide.]

Societies.

HIGHLAND AND AGRICULTURAL.—*Dr. Anderson's Address* (*continued from p.* 205).—*Rotation of Crops.*—Since the investigation of the chemical composition of our crops has become more minute and precise, the explanation of the cause of their rotation has become more difficult rather than more simple. It is familiar to all that the necessity for a rotation has been usually attributed to different crops extracting different inorganic constituents from the soil. Mr. Lawes has suggested another view deserving of notice:—

He believes that the necessity for a rotation depends upon the exhaustion not so much of the inorganic constituents of the soil, as of its nitrogen. His experiments have led him to the conclusion that nitrogen is an unnecessary constituent of the manure applied to the Turnip, while it is absolutely essential to the more exhausting Wheat, and to the cereals generally. Of course it is not meant that no nitrogen is required for the Turnip, but simply that that contained in the soil or derived from the air (in the form of ammonia or nitric acid) is sufficient for its requirements. But with Wheat, not only must nitrogen be present in the manure, but it must be there in a quantity out of all proportion to the quantity assimilated by the plant; in other words, that only a small proportion of the nitrogen of the manure makes its appearance in the plant, the rest being dissipated in some form or other. Mr. Lawes, founding on certain experiments which show that plants exhale nitrogen, believes that the nitrogen which has disappeared has actually undergone this process. In doing so (if I do not misunderstand his view), it acts, so to speak, as a carrier of carbon, that is to say, that the quantity which passes through stands in a direct relation to the quantity of carbon assimilated and converted into non-nitrogenous compounds, such as starch, &c. Hence, the cereals which contain in their seeds a large quantity of such compounds, require the passage through their system of abundance of nitrogen, and consequently exhaust the soil. Founding upon this view, he points out that the Turnip, which, when grown for its bulb, does not exhaust the soil, because it does not require nitrogen, becomes a scourging crop when grown for seed, which contains a large quantity of oil, and hence requires the expenditure of that element. Ingenious as this view is, I fear it can scarcely be considered as altogether satisfactory. The experiments on the exhalation of nitrogen by plants are too limited, and its amount too uncertain, to admit of the foundation of such a theory upon them. I think, moreover, that we can scarcely admit as a general fact that the Turnip does not require nitrogenous manures. Mr. Lawes' experiments, no doubt, give this result. It is very certain that the experience of farmers here is strongly in favour of guano for the Turnip, and guano, too, of the nitrogenous class—the different conditions of climate, no doubt, being the cause of the difference. And, in illustration of this distinction, I may mention a fact communicated to me by an extensive manure manufacturer, of scientific acquirements. He manufactures large quantities of superphosphate from coprolites alone, and he assured me that when sent to the south of England, it invariably gave satisfaction to those who employed it, while the very same substance in Scotland proved unsuccessful, and he had found it absolutely necessary to add a proportion of ammonia, or some other nitrogenous matter, to the superphosphate prepared for the Scotch market. The fact is, that the effect of a manure is not constant and definite, but varies to a much greater extent than we were at one time inclined to admit, under the influence of climate and various other circumstances; and ingenious as Mr. Lawes' idea is, we ought, I think, to suspend our judgment, and await the result of further experiments, before we adopt it.

The Feeding of Animals.—So extensive and elaborate have been the researches which have been made upon this subject, that I can attempt to give here but a very meagre account of them. The inquiries which have taken place may be divided into two classes—first, the determination of the chemical composition of the different substances used as cattle food, and second, experiments actually made upon the animals themselves.

In the first branch of the subject great progress has been made. The greater number of the analyses already executed have been founded on Boussingault's view, that the value of a food is invariably measured by the quantity of nitrogen it contains, and in many cases they have been confined entirely to the determination of that element. Of late we have seen reason greatly to limit this view, and it is now believed that the nitrogen only forms a correct measure of the relative feeding values of substances of allied characters. Even in this limited sense, Mr. Lawes doubts whether the results are correct. There is no question, however, that the want of accurate determinations of the amount of the respiratory elements (starch, sugar, &c.,) is to be regretted, and though no methods exist which permit their determinations with high accuracy, approximations may be made sufficient to serve all practical purposes. The experiments which have been made on animals during the last few years are remarkable for their extent and elaborate character. To Mr. Lawes, especially, agriculture is deeply indebted for a series of experiments, as yet but partially published, carried on with extraordinary precision on a most extensive scale, and at a very large pecuniary sacrifice. An equally important set of experiments has been undertaken by the Leipsic Economic Society, which have been directed in some respect to the elucidation of different points from those of Mr. Lawes. The first experiments to which I shall refer are those upon the comparative fattening qualities of different breeds of sheep. Mr. Lawes' experiments have been hitherto confined to three breeds, the Hampshire, Sussex, and Cotswold, in which a very marked difference is observed. The last appear to fatten more readily, and with a less expenditure of food than either of the others; for it is found that 100 lbs. increase of live weight is produced in the Cotswolds by the consumption of 259 lbs. oilcake, 219 lbs. clover hay, and 3668 lbs. Swedes; while the Sussex requires, to produce the same, 314 lbs. oilcake, 304 lbs. hay, and 4086 lbs. Swedes. In this respect, therefore, a marked economy appears on the side of the Cotswolds, and this becomes still more striking when we remember that the latter is a much larger breed than the Sussex, the average weight of carcase of the Cotswolds experimented on being 12 stone 3 lbs.; of the Sussex, 9 stone 3 lbs.; and though the former, owing to the inferiority of the meat, fetches a lower price in the market, the difference is far from sufficient to counterbalance its greater weight. Another interesting point distinctly brought out is the much greater amount of food required to produce a given increase of live weight towards the close of the fattening process. In the experiments which lasted 20 weeks, nearly half as much more food was required during the last four weeks, as during the first four weeks of that time, to produce the same increase in live weight. In a later paper on pig feeding, Mr. Lawes has still further developed these and other points, and has directed particular attention to the effect of the nitrogenous and non-nitrogenous elements of the food. It appears that the amount of increase diminishes in these as in the sheep towards the close of the experiment, and most rapidly when the food is most highly nitrogenous, and we may draw the practical conclusion that the food towards the end of the fattening process should be less nitrogenous. To a certain extent, however, it would appear that this diminished rate of increase is more apparent than real, for Mr. Lawes has ascertained that towards the end of the fattening the increase contains a much larger quantity of fat than at first, and increase of fat is attended with diminution of the per centage of water, so that the gain in live weight does not accurately represent the increase in real dry matter. It is also inferred from the experiments that the increase is more directly dependent on the non-nitrogenous or respiratory elements, for it appears that the consumption of the former to produce 100 lbs. live weight oscillated in the different experiments within very narrow limits, while the quantity of nitrogenous or protein compounds was sometimes three times as great as in other cases. The experiments on the whole strikingly illustrate the great physiological principle that there must be a proper balance between the flesh forming and respiratory elements, for in some cases the latter were clearly deficient, and in them the nitrogenous substances do not produce their full effect. In fact they are turned to other purposes, for as the respiratory function is a *sine qua non* of existence, when the constituents of the food which ought naturally to support it are deficient, those which would otherwise go to the formation of flesh are consumed in their place, and a wasteful expenditure of food is the consequence. The experiments of the Leipsic Society show that sheep cannot be fed to their full extent on hay alone, and that sheep of a particular breed which when fed on hay reach a weight of 90 lbs., acquire an additional 10 lbs. by the use of concentrated food. Further, that hay is not favourable to the production of fat, but that the grains, and especially Rape and Linseed cake, greatly surpass it. Experiments on cows have also shown that 1 lb. of Rape-cake given in the food produces an increase of ¾ lb. of milk, and that with cows of high milk-producing powers it may produce double that quantity, or, on the average, Rape-cake will produce its own weight of milk. The highest effect is produced by 2 lbs. daily, but this quantity is too high if butter is the object, as it acquires a disagreeable flavour; but when the milk is to be sold, this quantity may with safety be employed. In the production of milk, Rape-cake cannot be replaced by double its weight of hay; and under favourable circumstances, when conjoined with food poor in nitrogen, it will produce three times the nutritive effect of hay. These experiments on the nutritive value of Rape-cake have been followed by an inquiry into its effects upon the dung. From this it appears that when given to sheep, not for the purpose of fattening, but in small quantity and a part of their winter food, not more than 1-6th of the original quantity of nitrogen disappears during the nutritive process, and by decomposition, and the other 5-6ths remain in the dung. The quality of cow-dung is similarly increased; for as 1 lb. of Rape-cake produces 1 lb. of milk containing only 1-8th of the nitrogen of the cake, the other 7-8ths must manifestly appear in the dung. When, however, a rapid increase is taking place in the weight of the animal, a smaller proportion of the nitrogen will pass into the dung, and it may even happen that the whole of it may be consumed in the nutritive process. This actually occurred in one of the experiments where, in 14 days, 56 lbs. of Rape-cake gave an increase of 62 lbs. live weight, and at the same time 38 lbs. of milk. In this case the Rape-cake employed contained 2.8 lbs. of nitrogen, and the nutritive products 2.49 or very nearly as much, but this is, so to speak, a mere passing phenomenon, for so soon as the live weight corresponding to this mode of feeding is acquired, only that portion of nitrogen necessary for the milk is retained, and the remaining 7-8ths pass into the dung. It is manifest, however, that it must, in an economic point of view, be the aim of the farmer to obtain the greatest possible proportion of the nitrogen in the state of flesh or milk, and this the experiments show is best effected by combining the Rape-cake with substances extremely poor in nitrogen, but containing instead abundance of the respiratory elements. Such are the general inferences to be drawn from these very important experiments, and it is manifest that they are equally important to the science and practice of agriculture.

Reviews.

Present Prices of Agricultural Seeds, with Instructions on Cultivation. By Sutton and Sons, Seed Growers, Reading, Berks.

THIS tract, which is essentially, of course, an advertisement of the agricultural seeds for sale by Messrs. Sutton, is much more than a mere publication of names and prices, and we are permitted to make the following extracts, which furnish really useful information at the present season of the year.

"*Quantities of Seed to the Acre.*—The quantity of seed sown per acre varies greatly in different localities, but the following table may be a guide to gentlemen ordering seeds. If guano is drilled with it, the quantity of seed must be increased, as some will be destroyed by the guano. Swedish Turnips, 3 to 4 lbs. per acre; early large Turnips, 2 to 3 lbs.; stubble Turnip, 4 lbs.; Rape, 4 to 6 lbs.; Mustard, 16 to 24 lbs.; Mangold Wurzel, 4 to 6 lbs.; Carrot, 8 lbs.; Parsnip, 6 lbs.; Cow Cabbage (to transplant), 1 lb.; Kohl Rabi (to transplant), 1 lb.; Kohl Rabi, drilled, 4 lbs.; Trifolium incarnatum, 20 to 24 lbs.; Lucerne, 16 to 20 lbs.; Furze, for feed, 12 lbs.; Chicory, 4 lbs.; Rye, 2½ bushels; Italian Rye Grass, 2½ bushels; Vetches, 3 bushels; Buckwheat, 3 to 4 pecks; Saintfoin, common, 4 bushels; Saintfoin, giant, 5 bushels; Linseed for flax, 2½ bushels; Linseed for seed, 3 to 4 pecks; Maize, dibbled, 2 pecks; Beet, 6 lbs."

"*Instructions for the Cultivation of the Carrot.*—Carrot seed should not be sown in open fields before the third week of April, as it will not germinate until the temperature of the earth is considerably raised, and, consequently, the weeds indigenous to the soil are liable to get a-head of the Carrots, and seriously injure the crop. It is advisable to sow a little Rape or Mustard seed in the drills with the Carrot, which, coming up quickly, will show plainly where the drills are and allow of early hoeing, which is a most important point in the cultivation of this crop. Another mode now frequently adopted for attaining the above objects, is to sprout the seed by steeping it in moist sand before sowing; this is advantageous for several reasons, but care must be taken to turn the sand and seed over every day, to prevent its heating, and also not to sow in very dry weather, as the germ of the seed will suffer so much by the sudden check as not to recover entirely. When this practice is adopted the seed should not be put into the sand earlier than the second week in April, or the plants will be too forward, and liable to run to blossom, which spoils the root. Upon the whole we consider the former plan of sowing in the open ground (not earlier than the third week in April) is the safest. A funnel-shaped piece of tin held in the hand is the best means of depositing the seed; but where this is considered too tedious, a drill may be used, sawdust being mixed with the seed."

"*Instructions for the Cultivation of Mangold Wurzel.*—The best mode of sowing Mangold Wurzel seed is with the drill. Dibbling is more economical, however, as to the quantity of seed required; but if this plan is adopted, care must be taken not to set the seed more than half an inch below the surface, or it will not germinate. It may be sowed from middle of April till middle of May, but if sown late, it should be soaked in water for a few hours. If sown before the second or third week of April it is liable to suffer from

frosts, or if the weather should prove mild it will be too forward and run to seed. The practice of growing Mangold Wurzel and Carrots in alternate rows in the same field, as recommended by Philip Pusey, Esq., in the Journal of the Royal Agricultural Society, we proved to be highly profitable. The large leaves of the Mangold gather nutriment from the atmosphere, and the Carrot leaves being smaller, allow of a free current of air between the former."

Poultry.

SWANS: *F L S.* The male swan is generally larger than the female; the neck is thicker, and the "knob" on the bill more fully developed; it requires, however, an experienced eye to distinguish the sex, where the plumage does not vary.

Miscellaneous.

Improvements in Machinery for Cutting Standing Crops and Gathering the same into Sheaves or Bundles; by A. E. L. Bellford, Castle Street, Holborn. Patent granted March 12, 1853. (No. 624.)—Claims: 1. A rib or projection on the under side or surface of each cutting tooth, for the purpose of preventing the teeth being clogged in the fingers. 2. Giving the endless apron an intermittent motion, for the purpose of carrying the grain, straw, stubble, &c., back and depositing it in suitable quantities to be bound into sheaves or bundles. 3. Certain collecting hooks, for the purpose of collecting the grain, straw, stubble, &c., together into the form of sheaves or bundles ready for binding. 4. The combination of the collecting hooks, and intermittently moving carrying apron. *Mechanics' Magazine.*

Calendar of Operations.

APRIL.

WESTER ROSS, *April* 4.—Last month was such as permitted agricultural labour to progress rapidly. In some parts of the north drought has been already complained of. Here, however, there has been abundance of rain, which, with a naturally moist climate, leaves us no room for complaint. Spring Wheat was got sown in good condition, and is now presenting a vigorous braird. Oat-sowing is far advanced, and on the earlier farms is completed. There is little Barley sown in this quarter until the middle, or towards the end, of this month. The kinds of Oats principally sown here are Hopeton and Sandy; Birley, Potatoes, and late Angus, are sown to a limited extent. On good soil, and soil in fine condition, Hopeton suit well; they yield a large return per acre, but the straw is comparatively coarse. Sandy are well suited for a late climate or inferior soil; they come quickly to harvest, and yield a large quantity of good straw. Potato planting has been commenced, and farmers, encouraged by last year's abundant crop, and highly remunerating prices, will plant a greater breadth this year than was ever planted on any former one; so that, with an ordinary season, and unvisited by the blight, we would do much to supply the necessities of all but insatiable London. Many farmers have this year paid their rents with Potatoes, and a few have greatly exceeded this. The manure principally used is that from the court-yard, supplemented by guano or dissolved bones. This last-named manure has been found particularly suitable for growing healthy Potatoes. Hogs are now returning to their summer walks, greatly benefited by the open spring, and with the prospect of early Grass. Wheat and Grass are now much further advanced than at the corresponding season last year. Wheat and Barley, after having fallen a good many shillings, are speedily running up in price again.

WEST SUSSEX, *April* 11.—We have still a continuance of very dry weather, and now and then a white frost in the mornings, but this cannot be said to do any direct harm, as vegetation is not far advanced, and we have hope that it will come strong, as it may be said to have been brought up hardy. It is almost surprising that the Wheat should go on so well as it does. For though some of it suffered from the slug in the autumn, and has been left rather thin, yet what remains is doing well, and where it is thick enough it certainly has a promising appearance. Oats and Barley are up in many places and look well. Peas and Beans look in want of a shower, as they, especially Peas, begin to look a little rusty coloured; but, upon the whole, they present a fair appearance. Turnips are beginning to draw into little room, and Grass is not far advanced; the consequence is that all store stock have got to be in very little demand, and people wait to see how things will turn. There is no doubt that there will be a sharp demand so soon as we have a shower, but if we do not get that soon it will be very tight work to keep cattle in good condition. The young Clovers are a fine regular plant, and give promise of a large supply of food. All are busily employed getting in the Barley as fast as the sheep clear off the Turnips, and every spare time is occupied in clearing the Turnip land. Sheep are doing generally well, and lambs look healthy. There has been a few fat horned lambs in the market, but we have not yet seen any of the downs fit for the butcher, but another week will no doubt bring some forward, as it is well to get rid of the most forward before they go off the Turnips, as the change of food has sometimes a tendency to let them fall back. Many, to prevent this, let them have a little Grass before the Turnips are quite done, so that the change may be gradual. All fat stock are high in price and in good demand, and are likely to be so, especially if the present dry weather continue, and there is not likely to be so good a supply of them in the earliest summer months. *G. S.*

Notices to Correspondents.

GAS LIME: *J Abell.* We doubt its being a disinfector. It is an absorbent of oxygen; whereas, we presume, most disinfectants will act either by furnishing oxygen, or some similar means of combustion, or by furnishing acids, which fix volatile nuisances. A weak solution of green vitriol in water is as good a disinfectant for nightsoil as you can use.

ITALIAN RYE-GRASS: *J F C.* We do not know Mr. Dickenson's address. Possibly this notice may obtain it for you.

MANGOLD WURZEL: *T C W.* Three cwt. of guano and 3 cwt. of common salt per acre will be a good dressing.

NITRATE OF SODA: *C B.* About 1 cwt. per acre, well crushed, and sown broadcast in wet weather any time this month will answer the purpose either for Wheat or Grass. If sown at twice, one-half with the first rain and the other early in May, greater economy might be insured. We fear there is no remedy for a shallow burning soil. Experiments, however, with soot and salt, reported in the "Journal" by Lord Essex, seemed to indicate by their results advantages traceable to the absorbent and deliquescent character of the manure.

STEAM CULTIVATORS: *H S.* We do not know where any steam cultivators are to be seen at work. Usher's has been tried somewhat extensively in East Lothian, and the one invented by the author of the "Chronicles" is not yet at work.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

GIDNEY'S PRUSSIAN HOE.—Gardeners and Amateurs are informed that this useful Tool is now becoming a general favourite in the garden, and only needs a trial to be appreciated. Price 1*s.* 6*d.* handled. To be had of every Ironmonger and Seedsman. Manufactured only by GIDNEY & SON, East Dereham, Norfolk.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

(Fig. 1.)

(Fig. 2.)

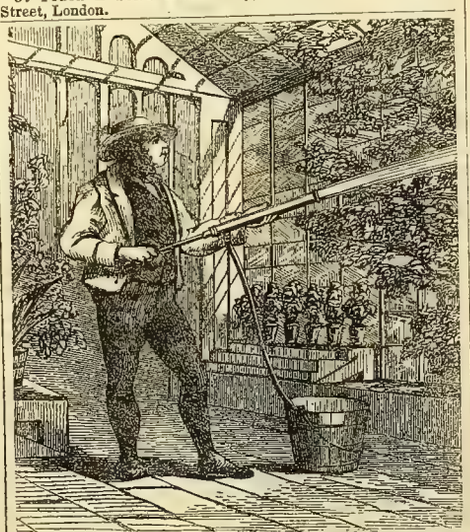
J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws	30	feet high		...	£4	10
No. 2 "	15	"	" 45 "	...	5	10
No. 3 "	28	"	" 45 "	...	6	18

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds	8	gallons, throws	25	feet high	...	£2 15
No. 13 "	12	"	"	30 "	...	3 5
No. 11 "	16	"	"	40 "	...	4 0
No. 12 "	24	"	"	45 "	...	5 0
No. 14 "	30	"	"	45 "	...	5 18

A large assortment of every description of Garden Syringes Pail Engines, Conservatory Pumps, &c., kept in stock.
Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.
J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.
N.B. Cost of carriage, &c., not included in these prices.
J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.
J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.
N.B. This price does not include carriage, package, or expenses of delivery in the country.

BUDDING'S LAWN-MOWING MACHINES, with Registered Improvements.
MAPPLEBECK & LOWE, MACHINISTS & MANUFACTURERS, Birmingham.

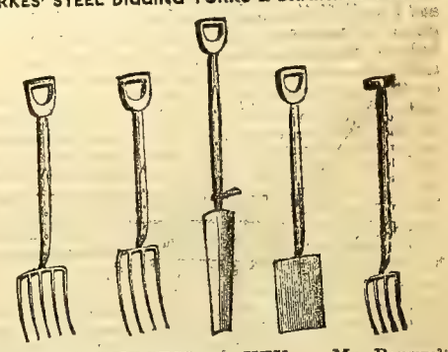
BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half,* and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

RICHMOND AND CHANDLER'S No. 1 CORN CRUSHER (Price 5*l.* 5*s.*) was first introduced a few years ago, as a decided improvement upon others theretofore made. Subsequent time and experience have served to render it more perfect, and to greatly extend the pre-eminent patronage of members of the Royal Agricultural Society, and distinguished scientific authorities throughout the world.—Address, RICHMOND & CHANDLER, Implement Works, Salford, Manchester; and 32, South John Street, Liverpool.
Export orders completed on the shortest notice.

HOSE-PIPING.—GREAT REDUCTION IN PRICE.
WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

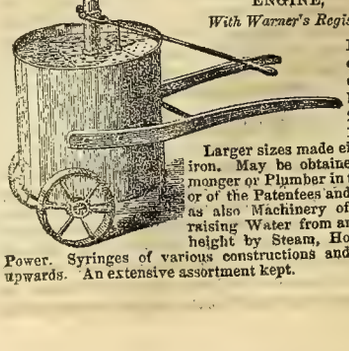
WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	*s.*	*d.*
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.
The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,
JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.
Every description of Machinery for Raising Water; Fire Engines, &c.

JOHN WARNER AND SONS,
CRESCENT, JEWIN STREET, LONDON.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader.



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.
Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

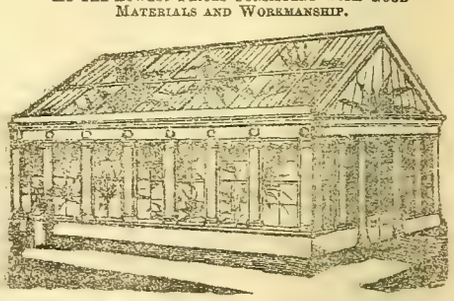
Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1 in. Greenhouse lights at 3½*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

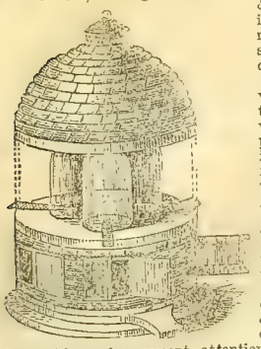
PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50*s.*, and upwards.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees, the produce being of crystal purity. The public are hereby cautioned against a piracy of this Beehive.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

TOBACCO PAPER! TOBACCO PAPER!

THE Cheapest and most effectual article for Smoking Greenhouses, and destroying the Fly on Plants, is Genuine Tobacco Paper, which JOSEPH BAKER, of 73, Fleet Street, can supply in large quantities, at 1*s.* per lb.; and if under 7 lbs. at 1*s.* 2*d.* per lb. Post-office Orders payable at the Strand Office.

JOSEPH BAKER, 73, Fleet Street, London (opposite the *Dispatch* newspaper).

CURE FOR MILDEW ON GRAPES, &c.—In consequence of the increased prevalence of mildew on the Vines, &c., during the last few seasons, G. TABER, of Rose Cottage, Rivenhall, practical Gardener, Seedsman, and Florist, has directed particular attention to the best mode of preventing it, or for curing the Vines that have been attacked, and he now begs to announce that he has succeeded in preparing a composition known as TABER'S ANTI-MILDEW COMPOSITION, which will effectually prevent or cure the disease without doing the slightest injury to the Vines; and any person, by the aid of the printed instructions, may use it without risk. It is also an invaluable remedy for preventing Mildew on Wall Trees, Roses, &c. Sold in packets containing 1 lb., 1*s.* 3*d.*; 3 lbs., 3*s.*; 6 lbs. 5*s.* 6*d.*, with directions for use. By enclosing two postage stamps, G. T. will send a circular with full particulars as to quantity required for a house for the season, and also testimonials of the success he has met with.

G. T. will personally attend gentlemen, and give instructions to their gardeners at a reasonable remuneration for time and travelling expenses. The trade supplied at the usual discount. Post Office orders to be made payable to GEORGE TABER, and drawn upon the Witham Post Office. Postage stamps received in payment of small orders. Packets delivered free to the Witham Station of the Eastern Counties line.—Address GEORGE TABER, Rose Cottage, Rivenhall, near Witham.

THE CHOLERA

PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts. 2*s.*; Pints, 1*s.*; Half-pints, 6*d.* Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.

HYGIENIC BATHS, A POWERFUL PROMOTER OF HEALTH AND WELL-BEING.—JENSEN'S Herbaceous Daphne Marina Salt for Baths, when dissolved in a cold, tepid, or warm bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known sea bath. Highly recommended by that distinguished Physician, Dr. Andrew Ure, M.D., F.R.S., &c.—Sold at 1*s.* per Packet, by C. MEINIG, 103, Leadenhall Street, and by all Chemists and Bathing Establishments.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.

ALL Sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, cash, or Post Office order, payable at the General Post Office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily, except Sunday, from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

TEA URNS, OF LONDON MAKE ONLY.—The largest assortment of London-made TEA URNS in the world (including all the recent novelties, many of which are registered) is on Sale at WILLIAM S. BURTON'S, from 30*s.* to 6*l.*

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 15*s.* 6*d.*; Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21*s.*; and Cots from 21*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 19*s.* to 13*l.* 13*s.*

PAPIER MACHE AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

Gothic shape Papier Maché Trays,
per set of three ... ... from 20*s.* to 10 guineas.
Ditto, iron ditto. ... ... from 13*s.* to 4 guineas.
Convex shape, ditto. ... ... from 7*s.* 6*d.*

A large quantity of small Papier Maché and Iron Trays, many of them executed in the highest style of art, at about a quarter of their original cost; being odd, or slightly out of condition. These are especially worthy the attention of tavern and coffee-house keepers. Round and Gothic Waiters, Cake and Bread Baskets equally low.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads, and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.

HEAL AND SON'S Stock comprises a large assortment of handsomely Japanned and Brass-mounted IRON BEDSTEADS, CHILDREN'S CRIBS and COTS of new and elegant designs; MAHOGANY, BIRCH, and WALNUT-TREE BEDSTEADS, of the soundest and best manufacture, many of them fitted with Furnitures, complete; and every variety of SERVANTS' and PORTABLE BEDSTEADS. They have also a large assortment of

BED-ROOM FURNITURE, comprising WARDROBES, both in Japanned Wood and Mahogany, from 4 feet to 8 feet long, fitted with every variety of arrangement; DRESSING TABLES and GLASSES, WASH-STANDS, DRAWERS, and every article for the complete furnishing of a Bed-room.

HEAL & SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced List of Bedding, containing designs and prices of upwards of One Hundred Bedsteads (representing a stock of upwards of One Thousand), sent free by post.

HEAL & SON, 196, Tottenham Court Road, London.

THE LATEST DISCOVERY IN ELECTRICITY.

ELECTRICITY IS VITALITY, and when communicated in mild but continuous currents by wearing MEINIG'S patent portable GALVANIC ELECTRO GENERATOR, for personal use. All Nervous, Functional, or Rheumatic Diseases (where no organic change has taken place) disappear with a safety, certainty, and speed, which is as marvellous as it is demonstrable beyond the possibility of a doubt; for the prospectus contains the names and addresses of more than 400 persons cured within the last 18 months by this extraordinary agent, which is moreover adopted in all the Hospitals in this country and in France, and by the first men of the day. The effects being instantaneously perceptible, may be tested freely and beforehand. Price from 5*s.* upwards, according to power. A full description of this extraordinary discovery may be had (by post for two stamps) of C. MEINIG, 103, Leadenhall Street London; or from all respectable Chemists.

N.B. In this new Apparatus durability is secured, and all metallic or wet contact with the body entirely obviated.

It weighs two ounces, and can be worn with the greatest comfort. MEINIG'S ELECTRO GENERATOR, when worn on the Liver, has been found a never-failing preventive of Cholera, supplying the central and hepathic system with vital energy, to resist and counteract all miasmatic influences.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT, INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8. Sunday excepted. Advice and Medicines, 1*l.*

HOLLOWAY'S PILLS, FOR IMPURITY OF THE BLOOD AND IRRITATION OF THE SKIN.—Persons subject to disorders of this nature generally suffer most at the spring and fall of the year; this may be greatly mitigated, and ultimately cured, by taking a course of HOLLOWAY'S Pills, as they are composed of ingredients peculiarly adapted for purifying the blood and cleansing the system. For Bile, Jaundice, Liver Complaints, and Diseases of the Stomach, they are admirably adapted, and quickly remove the causes of these ailments, thereby restoring the patient to a state of health, buoyancy of spirits, and elasticity of feeling, not to be attained by any other remedy.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

TO NURSERYMEN AND FLORISTS.

WANTED, to Rent or Purchase, within a reasonable distance of London, an Established Nursery, with a good residence.—Terms and full particulars as to extent of business, price required, and locality, to be addressed to A. C., 23, York Terrace, Regent's Park.

TO BE SOLD, with immediate possession, a NURSERY and FLORIST BUSINESS, three miles from Hyde Park Corner, comprising a convenient House, an acre and a quarter of Ground, with five Greenhouses and other conveniences, together with the stock. A good Jobbing Connection.—Apply to N. HUGHES, Nurseryman, near the Church, Hammersmith.

TO BE SOLD, by order of the Executors, a GREENHOUSE; Galvanised Iron Frame, ornamented with Stained and Plain Glass Insides, Ends, and Doors; measuring 18 feet square; nearly new: was purchased at Great Exhibition in 1851. Can be seen at Mr. WOODS, Florist, Bowyer Place, Camberwell Road.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

COCHIN CHINA FOWLS.

MR. THOMAS GILBERT, of Grays, Essex, having purchased of THOMAS STURGEON, Esq., his entire breed of 1853, Gentlemen and Amateurs are informed the Birds are now on Sale, and are bred exclusively from his best Stock Birds, Jerry and Nelson. Eggs may be had at 16*s.* per dozen, from the above.

BRAHMA POOTRA FOWLS' EGGS.

MR. ALFRED SALTER can supply EGGS of these much esteemed Birds at 20*s.* per dozen, from Birds of the stock of Messrs. Gilbert, Garbonnatti, and imported hens.—Address, Versailles, William Street, Hammersmith, Middlesex.

BRAHMA POOTRA EGGS, from the choicest Birds of an Amateur, Brahmas of whose breeding have competed successfully at the first Shows in the Kingdom, viz., the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Norwich, Winchester, and Manchester. Price three guineas per dozen, warranted from the best prize and selected birds only.—W. C. G., Post Office, Sandbach, Cheshire.

PRIZE SILVER POLANDS (Dr. HORNER'S STRAIN).—The Subscriber can now furnish EGGS of the above from the Birds he successfully exhibited the past year at Hitchin Great Yarmouth, and Norwich, and awarded 11 prizes, price 15*s.* per dozen; also Eggs from extremely small pure White Bantams (prize Birds), at 18*s.* per dozen.—Orders, with Post-office order, addressed to Mr HENRY YOUELL, Church Square, Great Yarmouth, will be promptly attended to.

SPANISH AND DORKING FOWLS.—Captain HORNBY having transferred his whole Stock of celebrated POULTRY to Mr. H. D. DAVIES, of Spring Grove, Hounslow, a portion (for want of space) is for immediate sale.

TO BE SOLD, a very fine silver-pencilled Hamburgh COCK and three HENS, chickens of 1853. These birds are the property of a Clergyman, and are from prize strains. The Cock is not from the same strain as the Hens. Price 2*l.*.10*s.*—Apply to Rev. F. H. L., Atherstone, Warwickshire.

Sales by Auction.

FANCY POULTRY—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, April 18, at 12 o'clock precisely, a choice selection of WHITE COCHINS, from the yard of G. H. Preston, Esq., of Great Yarmouth, fine Buff Birds from T. Shackle, Esq., of Hayes, some first-class White, Golden, and Silver Polands, from W. G. Vivian, Esq., of Singleton. A few Brahmas and other fancy varieties.—Catalogues, by enclosing a stamped directed envelope, to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

EALING PARK.

MRS. LAWRENCE'S STOVE AND GREENHOUSE PLANTS, AZALEAS, AND HEATHS, THE MOST IMPORTANT AND VALUABLE COLLECTION EVER OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is honoured with instructions (in consequence of the ill-health of Mrs. Lawrence) to Sell by Auction, at the Gardens, Ealing Park, on THURSDAY, 27th April, and following days, at 1 o'clock precisely, this unrivalled Collection of Magnificent Specimen STOVE AND GREENHOUSE PLANTS, AZALEAS and HEATHS, in all about 500. The Plants are so well known that it is sufficient to say they are the finest and best cultivated in the world, in admirable health, well set with bloom buds, and offering to Gentlemen and Nurserymen an opportunity of possessing specimens of transcendent splendour for exhibition at the forthcoming shows.—May be viewed Monday and Tuesday before the Sale, by Catalogues only, to be had (2*s.* 6*d.* each, returnable to purchasers) of Mr. J. C. STEVENS, 38, King Street, Covent Garden. It is probable that for the purpose of enlarging the Flower Garden, 10 out of Mrs. Lawrence's 26 Plant Houses may be offered for Sale. They consist of two long Ranges, a Centre, &c., with 2500 feet of Pipe, four Boilers, slate and wood Stage, Stone Pavement, &c., which may be viewed any time before the Sale, by applying to the head gardener at Ealing Park.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, April 13th, at 12 noon, a first-rate collection of Carnations, Picotees and Pinks, a selected assortment of Herbaceous and Alpine Plants, American Plants, choice Dahlias in dry roots, Fuchsias, Verbenas, Geraniums, and other Plants in bloom.—On view the morning of sale. Catalogues may be had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT SALE OF YOUNG SPECIMEN HEATHS, GREENHOUSE PLANTS, AND ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions by Mr. Epps, of the Bower Nurseries, Maidstone, to Sell by Auction, on TUESDAY, April 25th, at 12 o'clock, at the Auction Mart, Bartholomew Lane, nearly 300 Splendid Young Specimen Heaths, Greenhouse Plants, and Orchids. The Ericas consist of Obbatas, Hartnellis, Tricolors, Massoni, Ampullacea, vars. ferruginea jasminoides, vars. Cavendishi, Ventricosas, &c., &c.; the Orchids, Cattleya, vars. Dendrobiums. Oncidiums, Brassias, Maxillarias, Coelogyne, Vandas, &c. It is needless to state that the Ericas grown by Mr. E. are the finest and most healthy plants known; and on no occasion has there been submitted to the public so splendid a collection; they are calculated to suit all purchasers, as they consist of specimens in 8 to 20 inch pots, the bulk in 11 inch pots. The Orchids are choice and valuable species.—May be viewed the morning of Sale, Catalogues may be obtained (6*d.* each, returnable to purchasers), of Mr. Epps, Bower Nurseries, Maidstone; the principal Seedsmen in London; at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

READ'S GARDEN ENGINES, SYRINGES, &c.

WHEN an article of real utility attracts public attention, IMITATORS start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice of exhibiting in the windows of ironmongers and others, Syringes of the VERY COMMONEST DESCRIPTION, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

READ'S Instruments have the ROYAL ARMS, with the Address—**35, REGENT CIRCUS, LONDON.**

*** A liberal discount allowed to Nurserymen, Seedsmen, &c., &c.—Descriptions sent Post Free.

NEW DAHLIAS.

THOMAS BARNES will be prepared to execute orders on the 1st of May for the following:—

INDISPENSABLE (BARNES). Bright clear yellow, finest ever offered; constant; stock limited. 10*s.* 6*d.*

JOHN H. HEDGE.—Lilac and purple, new in colours, and very fine. 10*s.* 6*d.*

MADONNA.—Pink, carmine centre. 5*s.*

PURPLE PERFECTION.—Deep purple, fine. 3*s.* 6*d.*

The Petunias and Verbenas will be sent out from April 20.

☞ Catalogues, with descriptions and price, are ready, and may be had on application, of all the leading Dahlias, Fuchsias, Verbenas, Petunias, &c.

Dane Croft Nurseries, Stowmarket, Suffolk.

BEDDING PLANTS, 2*s.* to 4*s.* per Dozen.—Verbenas, sorts; Petunias, do.; Phlox, do.; Cupheas, do.; Geraniums, Scarlet; Ditto Pink; Ditto Horse-shoe leaved; Heliotropium, sorts; Ageratum; Fuchsia; Groundsel, purple; Salvias of sorts; Calceolaria ditto; Œnothera riparia; Koniga maritima; Zelinda or Dwarf Dahlia; Lobelias, sorts; Dahlias, do.; Anagallis.—Catalogues had by application to THOMAS PERKINS, Nurseryman, Atherstone, Warwickshire.

HUGH LOW AND CO. would invite inspection of their large and healthy stock of SOFT-WOODED PLANTS, suitable for Flower Garden decoration, amongst which they would more especially enumerate the under-named. The plants are all established in small pots well adapted for packing. Prices moderate, and purchasers of large quantities will be treated with great liberality. Calceolarias, shrubby and herbaceous; Coleus Blumeii, variegated foliage; Ageratum cœlestinum and variegatum; Fuchsias in all the leading varieties; Verbenas, do.; Chrysanthemums, do.; Phloxes, do. Scarlet and variegated Geraniums; Lantanas in many varieties; Pentstemons, do.; Petunias, do.; Lophospermums, do.; Maurandyas, do.; Mimulus, do.; Lobelias (tall and dwarf), do.; Antirrhinums, do.; Heliotropes, do.; Salvias, do. Double Crimson Rocket, Pentstemon purpureum hybridum, superior to all other varieties of P. gentianoides; Cheiranthus Delileanus; Pyrethrum grandiflorum plenum.—Clapton Nursery, London.

CALCEOLARIAS FOR BEDDING.—The following four very handsome varieties will be found the gems of the season for bedding purposes, at 12*s.* per dozen.

CRIMSON KING (Henderson), deep crimson, very dark and rich, and does not fade; habit dwarf and robust, flowers large, and shape good.

MAGNIFICENT (Henderson), rich crimson, with yellow crown; a large, fine-formed, and very splendid flower, quite distinct from anything yet out.

GOLD CHAIN, fine golden yellow, of great substance and fine habit, with very stout foot-stalks.

GOLD CAP (Garraway), rich dark maroon, the upper division of the flower deep gold colour, the flowers large and of fine compact habit.

Also the following older favourites for bedding:—

BEAUTY OF MONTREAL, fine bright crimson, dwarf habit, 6*s.* per dozen.

WELLINGTON HERO, rich deep golden yellow, 6*s.* per dozen.

SULTAN, large rich crimson, 6*s.* per dozen.

MRS. BEECHER STOWE, fine canary; 9*s.* per dozen.

SULPHUREA SPLENDENS, fine yellow, dwf. habit, 6*s.* per doz.

Calceolarias (Seedlings not yet flowered) raised from "Benary's" superb spotted varieties, 5*s.* per dozen, post free.

MITCHELL AND CO., having a large Stock of the following, are enabled to offer good, strong, healthy Plants at the annexed prices.

FUCHSIAS.—The following fine varieties of 1853, viz.: Alba multiflora, Belle of Barton, Beauty (Smith's), Collegian (Banks'), Duchess of Lancaster (Henderson's), England's Glory (Harrison's), Glory (Banks'), Incomparable, (Maple's), L'Elegant, Lady Franklin, Mrs. Patterson (Patterson), Miniata, Premier (Henderson's), Purple Perfection (Henderson's). The collection of 14 for 12*s.* 6*d.* A choice selection of older varieties—Agnes, Beauty of Deal, Cartoni, Crystal Fountain, Flavescens, Gem of the Season, Globosa Perfecta, Hendersoni, Nonsuch, Peculiarity, Princess, Purity, Resplendens, Splendidissima, the collection of 14 for 9*s.* Fine Mixed Bedding Varieties, 4*s.* per dozen.

PHLOXES of the choicest varieties, by name, 6*s.*, 9*s.*, 12*s.*, and 18*s.* per doz., strong plants.

Also their choice collection of TREE CARNATIONS, consisting of the most improved continental varieties, our own selection, by name, 9*s.*, 12*s.*, 18*s.*, 24*s.* per doz.

GERANIUMS of 1853.—Any 12 of the following choice varieties may be selected for 42*s.*; our own selection for 36*s.*; or the collection of 17 for 54*s.* Strong healthy plants in 48 size pots:—Dobson's Harriett, Jupiter, Spot, Vulcan; Hoyle's Attica Albinia, Butterfly, Kulla, Lagoma, Leonora, Novelty, Portia Zaria; Foster's Eleanor, Optimum, Rachel, Queen of May.

CHOICE HELIOTROPES.—Gem, Madame Boucharlet, Souvenir de Liege, Voltaireanum nanum, 6*s.* per doz.; mixed varieties of ditto, 3*s.*

Goods carriage free, for orders not under 20*s.*, to all London terminuses, and to all stations on the London, Brighton, and South Coast Railway. Plants added gratis with all orders of 30*s.* and upwards. Post Office orders expected from unknown correspondents payable to MITCHELL & Co., or JOHN FAIRBROTHER, Brighton Post Office.

Bristol Nurseries, Kemptown, Brighton.

MAY'S PARAGON CABBAGE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28 lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ¼ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

JNO. WESTWOOD has now on Sale, at the above Nursery, upwards of 60,000 FINE HEALTHY GERANIUMS AND FANCY GERANIUMS, including almost every variety grown, at very reduced prices; also, an immense Stock of Verbenas, Heliotropes, Petunias, Scarlet and other Bedding Geraniums, comprising all the newest and best sorts. The trade will be treated liberally.—April 15.

POMPONE CHRYSANTHEMUMS, SPLENDID MIMULUS, AND SEEDLING HERBACEOUS CALCEOLARIAS.

JOHN WESTWOOD, having a large Stock of all the leading Pompone Chrysanthemums (including those recommended by Mr. Robinson in the "Florist" of January last), is prepared to send out well established plants, at 9*s.* per dozen. Also several thousands of Mimulus, raised from the seed of the finest plants in the trade of 1853, at 9*s.* and 12*s.* per dozen; and an equally large Stock of Seedling Herbaceous Calceolarias from the seed of plants, raised by the Rev. E. Trimmer, finer than any hitherto exhibited.

J. W. can also supply any quantity of first-rate Bedding Plants, including Shrubby Calceolarias, of all the best kinds, of which he has on hand upwards of 20,000.

A General Catalogue may now be had on application.
The Floral Nursery, Acton Road, Turnham Green.

No. 3.	Do. Do. ...	0	10	6

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of genuineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "*Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th of June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have increased so much that I must now cancel my former order, and beg you to supply me according to the list now furnished.*"

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of *Gardeners' Chronicle*, March 11.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

HORTICULTURAL SOCIETY, 21, Regent Street. —Notice is hereby given, that the ANNIVERSARY MEETING of this SOCIETY will be held on MONDAY, May 1st, for the Election of Council and Officers for the ensuing year, and for receiving the Report of the Council for the past year. The chair will be taken at 1 o'clock P.M.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given that the EXHIBITIONS OF FLOWERS AND FRUIT, in the SOCIETY'S GARDEN, in the present season, will take place on the following SATURDAYS, viz: May 13, June 10, and July 8; and that TUESDAY, April 25, is the last day on which the usual privileged Tickets are issued to Fellows of the Society.

ROYAL BOTANICAL SOCIETY, REGENT'S PARK. —The days appointed for the EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season are WEDNESDAYS, May 24, June 21, and July 5; and of AMERICAN PLANTS, MONDAYS, June 12 and 19.

Tickets of Admission can be obtained at the Gardens by orders from Fellows of the Society. Price on or before May 13, 4*s*.; after that day, 5*s*.; or on the days of Exhibition, 7*s*. 6*d*. each.

The Plants will be arranged on a new plan, similar in form to the American Garden, and placed upon a series of terraces.

MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.

NOTICE.—THE FIRST EXHIBITION OF PLANTS, FLOWERS, FRUITS, AND VEGETABLES will be held at the Gardens, Old Trafford, on THURSDAY, the 27th day of April, instead of WEDNESDAY, the 26th, as stated in the Schedules, owing to that day being set apart as a day of humiliation and prayer. By order of the Council, JOHN SHAW, Sec.

Schedules of prizes may be obtained from the Secretary, or at any of the Seed shops.

COUNTY OF GLOUCESTER AND CHELTENHAM ROYAL HORTICULTURAL SOCIETY.—The FIRST EXHIBITION of the Season will take place at the Royal Old Wells, Cheltenham, on WEDNESDAY, May 3d. By the kind permission of Colonel the Hon. Arthur Upton, the splendid band of the Coldstream Guards will perform during the day. Exhibitors are particularly advised to attend to Rule No. 2, in the Schedule, as it will be strictly enforced.

HENRY J. COCHRANE, Sec.

Committee Room, 128, High Street.

FOR IMMEDIATE EFFECT IN DECORATING THE GREENHOUSE, CONSERVATORY, FLOWER GARDEN, AND ORNAMENTAL PLANTING.

YOUELL AND CO. beg to refer to their Advertisement of March 25, April 1, and 8.

100 kinds of very choice and free flowering Greenhouse or Conservatory Plants (Climbers included), 12*s*. per dozen.

Royal Nursery, Great Yarmouth.

FUCHSIA "TRENTHAM."

COLE AND SHARP, Aston Lane Nursery, near Birmingham, are prepared to send out the above fine new Seedling, for characteristics of which see previous advertisements. Plants 10*s*. 6*d*. each, with the usual allowance to the trade.

FANNY WEBB.—Plants of this new and attractive variety, 7*s*. 6*d*. each.

FUCHSIA DUKE OF WELLINGTON.

J. MOORE AND SON have still on hand a fine stock of this superb Fuchsia, for which they will be happy to receive orders at 10*s*. 6*d*. each. For description and opinions, see former Advertisements.

J. MOORE & SON beg also to call attention to their stock of Verbenas, &c.—Perry Barr, near Birmingham.

BEDDING PLANTS.—Many thousands of the above desirable Ornaments for the Flower Garden are now ready to be sent out, by JOHN SCOTT, of the Merriott Nurseries, near Crewkerne, Somerset, at the very low price of 2*s*. 6*d*. per dozen, consisting of

100 Sorts of VERBENAS		100 Sorts of FUCHSIAS	
50	" GERANIUMS	12	" CALCEOLARIAS
12	" PETUNIAS	12	" LOBELIAS

With many other kinds too numerous to particularise. Nearly all are autumn-struck plants. Early application is solicited.

N.B.—All other kinds of Nursery Stock extensively grown.

LOBELIA ST. CLARE.

MESSRS. LAKE AND DYER, NURSERYMEN, &c., Bridgewater, will be prepared to send out this truly beautiful plant (so universally admired last autumn) the first week in May, at 12*s*. per dozen. Postage stamps or Post-office Order must accompany all orders from unknown correspondents. N.B. The Trade supplied.

JOSEPH HARRIS respectfully announces that his Annual Spring Catalogue of Bedding Plants is now ready, and may be had on application; it contains all the newest and best Verbenas, Fuchsias, &c. &c.

Cheltenham Road Nursery, Stoke's Croft, Bristol.

WILLIAM FROMOW, NURSERYMAN & FLORIST, Turnham Green, Middlesex, offers 25 varieties of Showy HERBACEOUS FLOWER ROOTS for 3*s*. 6*d*., on receipt of Post Office Order or Postage Stamps.

NEW ROSES FOR 1854.

BENJAMIN R. CANT has now ready for sale, strong plants in pots of all the NEW ROSES, some of which have never before been offered to the public, descriptive Catalogues of which can be had on application.

St. John's Street Nursery, Colchester.

TO THE SEED TRADE AND OTHERS.

BENJAMIN R. CANT, St. John's Street Nursery, Colchester, can supply in quantity the following Home-grown Seeds, of excellent quality:—

	Per lb.—*s*.	*d*.
WHITE BELGIAN CARROT	1	0
LONG RED ALTRINGHAM Do.	1	0
YELLOW GLOBE MANGOLD WURZEL	1	0
LONG RED Do.	1	0

Prices to the Trade on application.

BEAUTIFUL NEW BEDDING PLANT.
MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s*. per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

BEDDING PLANTS, 2*s*. to 4*s*. per Dozen.—Verbenas, sorts; Petunias, do.; Phlox, do.; Cupheas, do.; Geraniums, Scarlet; Ditto Pink; Ditto Horse-shoe leaved; Heliotropium, sorts; Ageratum; Fuchsia; Groundsel, purple; Salvias of sorts; Calceolaria ditto; Œnothera riparia; Koniga maritima; Zelinda or Dwarf Dahlia; Lobelias, sorts; Dahlias, do.; Anagallis.—Catalogues had by application to THOMAS PERKINS, Nurseryman, Atherstone, Warwickshire.

BASS AND BROWN'S NEW POTENTILLAS, so favourably noticed in the *Gardeners' Chronicle*, the "Florist," the "Cottage Gardener," also by Geo. Glenny, and C. Turner, for which see descriptions and remarks in *Gardeners' Chronicle*, March 13, page 144, and April 1, page 208.

A great number of orders have already been received. Strong Plants will be sent out early in May.

	10*s*.	6*d*.
KING OF CRIMSONS	7	6
THEODORE	7	6
JULIA	10	6
SUDBURY GEM	10	6
SHYLOCK	10	6

The set for 42*s*. The usual allowance to the trade for two or more sets. The SECOND SET OF 7 VARIETIES, very fine, rich and showy, for 10*s*., with the same trade allowance as first set.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CHOICE AND RARE SEEDS

"WELLINGTONIA GIGANTEA."

MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant ... 2 guineas	For 8 Plants ... 10 guineas
For 4 Plants ... 6 guineas	For 12 Plants ... 12 guineas

And all orders will be executed strictly in the rotation in which they are received.—April 22.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7*s*. 6*d*. each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—April 22.

TO BE SOLD, by an East Norfolk Farmer, a few Sacks of LONG YELLOW and LONG RED MANGOLD WURZEL SEED, of good stock, all the growth of last year.—For price, address J. S., Post Office, Blofield, Norwich, Norfolk.

ARAUCARIA EXCELSA, AIT.

TO BE SOLD, a beautiful specimen of the ARAUCARIA EXCELSA, in luxuriant health and beautiful foliage, now standing in the Botanical Garden, Rotterdam (Holland). Height above the tub in which it stands, 20 feet 9 inches; with the tub, 23 feet; diameter of the spread of its branches, 13 feet 1 inch; the tub in which it stands is 2 feet 2 inches diameter.—For further particulars apply to C. A. J. A. OUDEMANS, M.D., Director of the Botanical Garden, Rotterdam, Holland.

FINE MANGOLD WURZEL SEED.

LONG RED MANGOLD WURZEL.—Fine new Seed, 10*d*. per lb., or 70*s*. per cwt.

JOHN SUTTON AND SONS, Seed Growers, Reading, having a large Stock of the above, are now selling it at the low price here quoted. LARGE YELLOW GLOBE and other sorts, as see Priced List, which may be had in return for one Postage Stamp.

ORANGE GLOBE MANGOLD WURZEL SEED FROM SELECTED ROOTS. Price 1*s*. 4*d*. per lb., or cheaper in larger quantities. Priced Lists of Turnips, Mangold Wurzel, and other Seeds, post free.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

GARDEN SEEDS FOR PRESENT SOWING.—Good Seeds of all the best kinds of Lettuces, Broccolies, Cauliflowers, Peas, and other Vegetables, may still be obtained of the undersigned. Priced Lists post free.—Address,

JOHN SUTTON AND SONS, Seed Growers, Reading, Berks.

SEEDS DIRECT FROM THE GROWERS
THE MOST CERTAIN MEANS OF PREVENTING DISAPPOINTMENT.

SEEDS GROWN IN BERKSHIRE and the adjoining Counties having obtained great celebrity, we have made such arrangements with Messrs. Pickford & Co., who have offices on most of the great lines of Railway, as will enable us to deliver our Goods FREE OF CARRIAGE to most parts of the United Kingdom.

Catalogues and other particulars may be obtained by post, on application to us, addressed

JOHN SUTTON AND SONS, Seed Growers, Reading, Berks.

SUTTON'S GRASS SEEDS FOR PRESENT SOWING. *The importance of procuring good Seeds will be proved more this season than usual, in consequence of the extreme drought which has prevailed so long.*

We are receiving very gratifying intelligence of the crops growing from the seeds we have supplied during the last few months. One of our customers (Mr. Joseph Newton) writing us from Biggleswade, on the 15th inst., says:—"The Grass seeds I had from you have convinced our farmers that it is better to have your selected *ripe seeds* than to use the unripe hay seeds, from the cow-cribs and hay-lofts." Having a fine stock, we can still supply seeds, which may be sown now with certainty of success, viz., Permanent Pasture Grass Seeds; Seeds for Improving old Pastures; Turnip, Mangold, and other Agricultural Seeds. Priced Lists may be had, post free.

SUTTON & SONS, Seed Growers, Reading, Berks.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to call attention to their MIXTURES OF GRASS SEEDS for laying Land down to Permanent Pastures, price 20*s*. per acre.

Mixed sorts, for Improving Old Grass Land	1*s*. 2*d*.	per lb.
Fine sorts for Forming and Renovating Lawns	1 3	"

Directions for sowing accompany the Seeds.

GEORGE GIBBS & Co. will be happy to forward their Priced Catalogues of Mangold Wurzel, Carrot, Swede, Turnip, and all Agricultural Seeds, free on application to GEORGE GIBBS & Co., Seedsmen, 26, DOWN STREET, Piccadilly, London.

N. GAINES begs to announce he will be prepared to send out his New SEEDLING DAHLIAS—ALBA SUPERBA, 10*s*. 6*d*. per plant; PRIMROSE PERFECTION, 10*s*. 6*d*. per plant; and KING OF THE YELLOWS, 10*s*. 6*d*. per plant. Also a good Collection of named Varieties raised by other growers. A large quantity of Bedding-out Plants will be ready at the same time, such as Verbenas, Salvias, Tom Thumbs, and other Scarlet Geraniums; Calceolarias, Petunias, &c. His large Collection of Show and Fancy Pelargoniums is coming into flower; they can be seen gratis any day, Sunday excepted.

Nurseries, Surrey Lane, Battersea, April 22.

BEAUTIFUL NEW PETUNIA.
"MONTREAL PURPLE" (SMITH.)

W. F. SMITH, Riverhead Nurseries, near Sevenoaks, will be prepared to send out, on and after May 1st, strong plants of the above splendid Petunia, at 3*s*. 6*d*. each. This variety possesses a first-rate habit, and produces fine large bold flowers of good form, well above the foliage; and it has proved to stand the wind and rain better than any other variety.

W. F. S. is confident that the above will give as much satisfaction as the Geranium "Lady Holmsdale," and Calceolaria "Beauty of Montreal," sent out by him in 1852. W. F. S. has also some splendid Plants for vases of Geraniums "Lady Holmesdale" and "Flower of the Day," from 20*s*. to 30*s*. per dozen.—Catalogues of Stove, Greenhouse, and Bedding Plants may be had on application.

CAPE HEATHS AND NEW AZALEAS.

W. J. EPPS begs to call attention to his extensive and rare Collections of Heaths and Azaleas, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c. AZALEAS—Prince Albert, Gledstanesi, Excelsa, Murrayana, Alba magna, Duke of Devonshire, Holderi, Toilette de Flora, Glory of Sunning Hill, Symmetry, Splendens, Ignescens, &c., &c., 9*s*., 12*s*., 18*s*., and 21*s*. per dozen; 5*l*. per 100 varieties, carriage paid to London. All the new Stove and Greenhouse Plants, Fuchsias, Verbenas, and Roses, equally moderate. Catalogues of the above sent on application.—Nurseries, Maidstone and Ashford.

TO DAHLIA GROWERS.—EDWIN HARRISON (PERRY'S), is the most brilliant crimson Dahlia ever raised; build and form of General Fauchier, and more constant than any crimson Dahlia in cultivation. No grower can be without it; as an ornamental plant it has no rival. It has obtained one first-class Certificate and three first Prizes as the best crimson Dahlia, beating all other varieties. Plants in May, 10*s*. 6*d*. each.

ALEXANDER POPE (PERRY'S), is a constant well-formed Dahlia, with very high centre; colour pale lemon. It has obtained one first-class Certificate and two first Prizes as the best yellow or buff Dahlia. The *Gardeners' Chronicle* says—"We like the flower much for its novelty." Plants in May, 7*s*. 6*d*.

Early orders are solicited, as the stock is small.—HENRY POPE, Gib Heath, near Birmingham.

PHLOXES.

YOUELL AND Co. have the pleasure of submitting the following list of very choice varieties of this beautiful tribe, which they can supply in strong flowering plants, at 9*s.* per dozen, viz.—Spenceri, Imbricata, Abdel Medschid Khan, Anais, Captivation, Elegantissima, Eliza, Hydrangæformis, Imperialis major, Roi Leopold, Macrantha, Madame Courcelles, Madame Poivre, Napoleon, Nelsoni, Princesse de Cleves, Speciosissima, Villaret Joyeuse, Princesse Marianne, Speculum, &c.

YOUELL & Co., Royal Nursery, Great Yarmouth.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE AND HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2*s.* 6*d.* per packet; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years.

B. & H. are prepared to send out their Catalogues of Kitchen Garden and Flower Seeds, post free, on application, and also their Catalogue of Plants is now ready, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by NOBLE, COOPER, & BOLTON, Fleet Street; CHARLWOOD & CUMMING, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, April 22.

DAHLIAS.

JOHN KEYNES, in taking the present opportunity of expressing his acknowledgments to his kind friends for the favours conferred on him in past seasons, and in offering his Annual Catalogue for their inspection, trusts that the NEW FLOWERS recommended by him will continue to give that general satisfaction which it has been his pleasure to find has hitherto been so generally approved.

J. KEYNES feels great pleasure in being able to offer this season such NEW FLOWERS as cannot fail to be appreciated. His unrivalled success in obtaining First Class Certificates with them must be a sufficient proof of their excellence; and wherever he has exhibited them they have called down unprecedented approval; in fact, they are considered by the first judges to be the best Collection of New Flowers ever offered, and will, without question, remain Standard Flowers for many years.

FANNY KEYNES (KEYNES).—Light yellow, deeply edged with bright crimson, always full and close, compact eye, habit of Triumphant, and one of the most magnificent flowers ever offered; easy of growth, constant, quite up in the centre, every way the first of its class. 4 ft. 10*s.* 6*d.*

FIRST CLASS CERTIFICATES.

National ...	... 3 blooms	Salisbury ...	... 6 blooms
Hackney ...	... 6 "	Surrey Gardens	... 3 "
Norwich ...	... 3 "	Edinburgh ...	... 3 "
Brighton ...	... 6 "	North London	... 6 "

Was never shown without obtaining a first class certificate.

RACHEL RAWLINGS (KEYNES).—A pure peach, unrivalled form, exquisite flower, and whoever has seen it has acknowledged it to be one of the finest flowers they have ever beheld. 4 ft. 10*s.* 6*d.*

FIRST CLASS CERTIFICATES.

National ...	... 6 blooms	Salisbury ...	... 6 blooms
Hackney ...	... 6 "	Surrey Gardens	... 3 "
Norwich ...	... 3 "	Edinburgh ...	... 3 "
Brighton ...	... 6 "	North London	... 6 "

Was never shown without obtaining a first class certificate.

COL. BAKER (DODDS).—Clear light sulphur yellow. This flower was grown by Mr. Dodds, who has been the most successful raiser of Yellow Dahlias, having had the best ever sent out in their day, particularly Yellow Standard, which is even now at times unrivalled. J. KEYNES again offers the best yellow ever yet sent out in Col. Baker; very full, compact cushion eye, unrivalled symmetry, and constant. The smallness of the stock has been the reason of its not being oftener seen; but where it has been shown it has received unqualified praise. 4 ft. 10*s.* 6*d.*

FIRST CLASS CERTIFICATES.

National 3 blooms | North London 3 blooms | Salisbury 3 blooms.

Was never shown without obtaining a first class certificate.

MRS. RAWLINGS (RAWLINGS).—Blush white. The form of this flower is first-rate in every respect, the eye quite the summit, and the best blush without question, and a fit companion for Lilac King and Exquisite, which were sent out by the same grower last year. 3 ft. 10*s.* 6*d.*

FIRST CLASS CERTIFICATE—Brighton.

JOHN KEYNES (DODDS). Pale salmon. This is another gem of the season, and must be grown by all exhibitors. Requires no cutting out, and will make a noble back row flower; of exquisite symmetry, eye well up, and every way first-rate. 4 ft. 10*s.* 6*d.*

CERTIFICATE AT

National ...	... 6 blooms	North London	... 3 blooms
Brighton ...	... 6 "	Salisbury ...	... 3 "

LADY BATHURST (BROWN).—This flower was raised by the grower of that unrivalled flower, Sir F. Bathurst; and J. KEYNES feels confident that its companion is equal in every respect to it. Colour, rosy purple. One of the finest flowers in cultivation. 4 ft. 10*s.* 6*d.*

PRIMROSE PERFECTION (KEYNES).—Pure bright primrose without shading, one of the most useful Dahlias ever offered; always producing fine blooms, and fit for any stand. Certificate at the National for its general good qualities. 5 ft. 10*s.* 6*d.*

FANCY FLOWERS.

With the exception of one first-class Flower, J. KEYNES has been so fortunate as to secure all the Fancy Flowers which have made way this year in obtaining Certificates, which alone is a sure test of their merit, particularly when they have been exhibited at Great Shows, and tested by the best judges in the kingdom. A flower may take a certificate at a little provincial show, but let it bear the test of the National and Metropolitan judgment, and if it obtains a first class certificate its success is sealed, and it comes out with confidence and honour. Scarcely one flower of J. KEYNES's but has passed these tests, and been victorious.

LEADER (KEYNES).—Lilac, ticked and striped with maroon; finest stripe yet offered. 4 ft. 10*s.* 6*d.*

FIRST CLASS CERTIFICATES.

Salisbury ...	... 6 blooms	Hackney ...	... 6 blooms
National ...	... 3 "	Surrey Gardens	... 3 "
Brighton ...	... 6 "	North London	... 6 "

MARVEL (POPE).—Yellow, striped red. A most constant, useful, and beautiful flower, always to be depended on, and first class in every respect. 4 ft. 10*s.* 6*d.*

FIRST CLASS CERTIFICATES.

National ...	... 3 blooms	Slough... ...	... 3 blooms
Surrey Gardens	... 3 "	Teddington ...	....3 "
		Hackney ...	... 3 "
North London	... 3 "	South London	... 3 "

TOPSY (KEYNES).—Colour of Elegantissima, but infinitely superior; always to be depended on, and one of the finest fancy flowers in cultivation. White, edged and mottled with purple. 3 ft. 10*s.* 6*d.*

FIRST CLASS CERTIFICATES.

Salisbury ...	... 6 blooms	Hackney ...	... 6 blooms
Surrey Gardens	... 3 "	North London	... 3 "

UNCLE TOM (DODDS).—Red, tipped white; superior in constancy to Nancy; good eye, always full. 3 ft. 10*s.* 6*d.*

Fine Plants, as usual, in May, 1854, with plants to compensate for carriage.—Castle Street Nursery, Salisbury.

GRASS SEEDS, ETC.

THOMAS GIBBS AND CO. (the SEEDSMEN to the Royal Agricultural Society of England), corner of HALF-MOON STREET, Piccadilly, beg to draw attention to their Grass Seeds for Laying down Land to Permanent Grass. The Seeds which they employ in forming the Mixtures for various soils are well cleaned under their own superintendence.

Mixtures for Permanent Meadows and Pastures
" Parks or Pasturage in sight of Mansions
" Irrigation on Water Meadows
" Renovating Old Swards
" Fine Garden Lawns, Cricket Grounds, &c.
" two or three years' lay.

RYE-GRASS—Italian, very fine sample
" Dickinson's Italian do.
" Pacey's Perennial and Evergreen
" Annual or Common.

CLOVERS—Red, White, and Alsike
" Trefoil, Red Suckling, &c.

CARROTS—Large White Belgian
" Field, Altringham, &c.

MANGOLD WURZEL—Long Red
" Orange or Yellow Globe, and other sorts.

TURNIPS—Swedes, Purple Top, Skirving's, &c.
" Hybrids, Gibbs' Green Top
" Globes, Tankards, &c.
" FARM SEEDS of all descriptions.

Priced Lists, Detail Catalogues, and other information can be obtained on application to THOMAS GIBBS & Co.

S. WALTERS, Hilperton and Trowbridge Nurseries, Wilts, begs to offer the following NEW PETUNIAS, which he can recommend:—

BIGIO, deep rosy purple, of the best shape, a free bloomer, and a fine bedding variety, 2*s.* 6*d.* each.

SILVER QUEEN, glossy blush, with fine dark eye, shape and habit good, very fine for bedding, 2*s.* 6*d.* each.

JULIET, light, finely veined, striped with crimson purple, fine habit, and very attractive, 2*s.* 6*d.*

SURPRISE, lilac, striped with purple, free bloomer, of the best shape and habit, 2*s.* 6*d.* each.

PICTURATA, light, finely striped with purple, of great substance and fine shape, 2*s.* 6*d.* each.

CRATIA, light, deeply mottled with rose, very dark eye, shape and habit good, and fine for bedding, 2*s.* 6*d.* each.

GERANIUMS, NEW AND CHOICE VARIETIES, strong and showing flower, 12 of the following for 21*s.*—Arethusa, Ariadne, Alibi, Astrea, Albira, Basilisk, Butterfly, Boule-de-Neige, Chieftain, Diana, Extravaganza, Elise, Eurydice, Exhibitor, Exactum, Ganymede, Gertrude, Jullien, Lavinia, Magnet, Mont Blanc, Mochanna, Monteith, Novelty, National, Ocellatum, Optimum, Ondine, Painter Improved, Purple Standard, Shylock, Silk Mercer, Volcano. Other choice kinds, 6*s.*, 9*s.*, and 12*s.* per dozen.

FANCY GERANIUMS, such as Annetta, Defiance, Othello, Gipsy Queen, Mariosa, &c. &c., 6*s.* to 9*s.* per doz.

FUCHSIAS, the best of last season, Duchess of Lancaster, England's Glory, Banks' Glory, Lady Franklin, Mrs. Patterson, Vesta, from 1*s.* 6*d.* to 2*s.* 6*d.* each.

VERBENAS, the best of last season, 9*s.* per dozen.

BEGONIA PRESTONIENSIS, 2*s.* 6*d.* to 3*s.* 6*d.* each.

AGERATUM VARIEGATUM, 1*s.* each.

PENTSTEMON ATROCÆRULESCENS, blue, 1*s.* each.

BEDDING PLANTS, in good variety, at 3*s.* to 6*s.* per dozen.

Orders of 1*l.* and upwards will be forwarded any distance not exceeding 100 miles.

SAMUEL WALTERS, Hilperton and Trowbridge Nurseries, Wilts.

P.S.—S. W.'S 18th Annual Catalogue to be had in exchange for one postage stamp.

ALEXANDER PONTEY, NURSERYMAN and SEEDSMAN, Plymouth, has an extensive and very fine Stock of the choicest varieties of the following BEDDING PLANTS, from 4*s.* to 5*s.* per dozen:—

Verbenas, best new sorts of 1853	Salvias, sorts
Petunias, sorts	Calceolarias, sorts
Phlox Drummondi	Nierembergias
Cupheas, sorts	Ageratums

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of genuineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "*Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th of June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have increased so much that I must now cancel my former order, and beg you to supply me according to the list now furnished.*"

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of *Gardeners' Chronicle*, March 11.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

PRIZE MANGOLD WURZEL AND SWEDE SEED.

SUTTON AND SONS have a fine stock of Seeds of the best kinds of Swedes, Mangold Wurzel, Carrot, &c., similar to those they supplied last season, the produce of which gained prizes at all the principal root shows throughout the kingdom.

At the Annual Root Show, held at Basingstoke, Hants, on December 21, 1853, at which 16 prizes were awarded for root crops, 13 were gained with the produce of our seeds; and at the Reading Show, on the 1st of the same month, every prize was awarded to roots grown from our seeds.

A Priced List, with Hints on Cultivation, may be had, post free, in return for one penny stamp.

SUTTON & SONS, Seed Growers, Reading, Berks.

GEORGE TURNER, of East Barnet, begs to inform the public, that he is a Collector and Cultivator of BRITISH ORCHIDS, GRASSES, AND AQUATICS, and that he has a choice collection of ALPINE and other rare and interesting Plants.

MAY'S PARAGON CABBAGE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28 lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ½ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

GERANIUMS, CALCEOLARIAS, MIMULUS, CHRYSANTHEMUMS, ETC.

THE FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

JOHN WESTWOOD, having now the largest and best selected stock of the above in the kingdom, including almost every variety known, is enabled to offer them for sale at prices unequalled.

None but healthy well-established Plants will be sent out, and all orders will meet with prompt attention, and so as to insure future support and recommendation.

J. W. has also for sale an immense quantity of Bedding and Soft-wooded Plants generally.

Catalogues sent (post free) to all parts.

N.B.—The Trade will be treated liberally and fairly.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

SPLENDID NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that his beautiful New Seedling Shrubby CALCEOLARIAS are now ready to send out, in two sets, viz., First Set of 15, 3*l.*; Second Set of 15, 2*l.* For description, see Catalogue, which may be had on prepaid application.

H. M. offers a third set of 20, to include some of his very best sorts sent out the two last years, as well as several of last year's Seedlings not yet let out, price 30*s.*

OPINIONS OF THE PRESS UPON MR. MAJOR'S CALCEOLARIAS.

"MR. HENRY MAJOR, of Knosthorpe, near Leeds, has devoted much time to the improvement of the Shrubby Calceolaria, and to him, perhaps, more than any other individual, we are indebted for the perfection and beauty which have been obtained in this class of plants. Mr. MAJOR has, this season, a splendid lot of seedlings."—*Abridged from the Durham Advertiser, May* 13, 1853.

"H. M. We never before saw a collection of Seedling Calceolaria blooms, for perfection in form and beautiful colouring, equal to yours; they are far superior to any we have seen at the London Exhibitions."—*Floricultural Cabinet, July*, 1853.

"H. M. As a whole, the best collection of Calceolaria Seedlings we have seen this year."—*Abridged from the Cottage Gardener, June* 16, 1853.

"Z. Z. Your varieties are of the right stamp, something different from the interminable yellow and brown. We like No. 5 best; it is a very lively and novel variety. Next 43, then No. 3. The others are very pretty."—*Midland Florist, August*, 1853.

Very choice CALCEOLARIA SEED, 2*s.* 6*d.* per packet.

Orders from unknown correspondents inclosing Post-office order will be punctually attended to. Postage stamps are respectfully requested in payment of the seeds.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, have much pleasure in stating that they have purchased the entire property of the following NEW PLANTS, which will be duly announced in this Paper when ready for sale.

CAMELLIA, JENNY LIND.—This most superb formed Camellia was raised by Mr. Peter Mackenzie, of Philadelphia, U. S., from whom we purchased the stock.

ECHITES ELEGANTISSIMA.—This plant in appearance resembles E. crassinoda, with the exception of foliage being much broader and hairy; the flowers are larger and much higher coloured, being of a rich carmine. We purchased the stock of M. Louis Van Houtte, of Ghent, Belgium.

HELIOTROPIUM, BEAUTY OF THE BOUDOIR.—This is the finest and most useful, surpassing all the others, having all their good qualities combined; the entire stock was purchased of M. Lambert Joviel, Liége, Belgium.

HYDRANGEA HORTENSIS FLORE PLENO.—This remarkable novelty will be found a great acquisition; the flowers are double, and remain on the plant for a long period in full beauty; the colour is the same as the Hortensis, either blue or pink, according to the cultivation. The entire stock we purchased of Messrs Chauviere and Rougier, of Paris.

RHODODENDRONS (NERVANE'S SEEDLINGS).—These superb varieties will be described hereafter; they are splendidly spotted and very fine. We have purchased 21 seedlings of M. Vervane, Ledeberg, Belgium, from which only six are selected, and will be placed in commerce.

AZALEA, GLORY OF FONTAINBLEAU.—This is a flower of good substance, rich deep crimson spotted, large and very conspicuous; the entire stock we purchased of M. Martine, of Fontainbleau, France.

INGRAM'S PRINCE OF WALES STRAWBERRY.—This splendid new Strawberry, now so extensively grown at the Royal Gardens, Frogmore, both for forcing and out-door culture, may now be had of J. AND E. SMALL, at the following reduced prices:—Strong well-rooted Plants, 25s. per 100, or 15s. for 50. This is quite a distinct Strawberry to the Prince of Wales now being sent out by Mr. Cuthill, of Camberwell. Order Ingram's Prince of Wales.

The following new kinds can also be supplied at moderate prices:—Trollope's Victoria, Myatt's Superfine, do. Prolific, Nicholson's Ajax, do. Ruby, and Jackson's Britannia. The usual discount to the trade.—Agents, Messrs. NUTTING & SONS, Seedsmen, 46, Cheapside, London.

BASS AND BROWN'S SEED AND PLANT LIST free by post for three penny stamps.

FLOWER SEEDS—BEST ASSORTMENTS, free by post.

The Catalogue gives colours, heights, months of flowering, hardiness, duration, and much descriptive information of time of sowing, and other treatment.

	s.	d.
100 varieties select showy Annuals, including the newest	15	0
50 vars. do., 8s. 6d.; 30 vars., 5s. 6d.; 20 vars.	4	0
20 varieties best Dwarf Annuals, in large packets, for filling beds on lawns, 7s. 6d.; 12 do.	5	0
20 vars. choice Greenhouse Annuals, including the new, 7s. 6d.; 12 varieties, do.	5	0
20 vars. choice Greenhouse Perennials, including fine and new	10	6
12 varieties ditto ditto	7	6
20 vars. Hardy Biennials and Perennials, including very choice and new, 7s. 6d.; 12 varieties do.	5	0

The following we beg strongly to recommend as saved from collections of first-class flowers, in packets as follows:—

	s.	d.
Calceolaria, very choice, 1s.; extra superb, from fine selected flowers	2	6
Cineraria, very choice, 1s.; extra new and choice from our superb collection	2	6
Geranium, Scarlet, from our choice collection	0	6
Gloxinia, choice, 6d.; extra, from our superb collection ...	2	6
Petunia, new and choice, from our superb collection ...	1	0
Verbena, very choice, 1s.; extra, from our superb collection of new varieties	2	6
Antirrhinum, choice, 6d.; from new of our superb collection	1	0
Carnation and Picotee, from collection of 400 vars	2	6
Gladiolus, fine mixed early, 6d.; from choice named of our superb collection	1	0
Iris, English vars, fine, 6d.; best of our superb collection...	2	6
Pansy, extra choice, from a first-rate collection	1	0
Potentilla, very choice, 1s.; extra, from our very beautiful collection	2	6
Ranunculus, from our superior collection	2	6

A FEW VERY CHOICE NEW FLOWER SEEDS.

Leptosiphon luteum, fine orange colour; very beautiful, packets, 1s. and	2	6
Nemesia bicolor, white and blue, very showy and attractive half-hardy annual, height 9 inches, beautiful for massing	0	6
Calceolaria chelidinoides, ex., clear bright yellow, fine for massing on lawns; the mouth being closed, it is not injured by wet	1	0
Lobelia Limbungensis, a new perennial variety from Prussia, extra	1	0
Portulacca aurantiaca, new orange, 1s.; nova rosea ...	1	0
Sweet William, very choice striped French	0	6

☞ Goods CARRIAGE FREE with orders of 20s. and upwards to London, Ipswich, Norwich, or any Station on the Line.

Remittances are requested with orders from unknown correspondents. Post-office Orders to be made payable to BASS & BROWN, or to STEPHEN BROWN.—The Autumn and Spring Catalogues supplied free by post for three penny stamps each, the cost of which may be deducted from orders sent.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk. ESTABLISHED ABOUT HALF A CENTURY.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6 to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.
" Goveniana, 2 to 3 and 4 feet.
" Funebris, 2 and 3 feet.
" thyoides variegata, 2, 3, and 4 feet.

The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.
" Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.
" repandus, 3, 4, 5, to 8 feet.
" Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns, and, except at Elvaston, unequalled.
" Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.
" Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.
" Gold striped, 1, 2, and 3 feet.
" do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.
" elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.
" Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.
" insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.
" cambra, 3, 4, to 6 feet.
" Canadensis (Hemlock Spruce), 3, 4, and 6 feet.
" morinda, 3, 4, and 6 feet.
" Menziesi, 3, 4, 6, and 8 feet.
" cephalonica, 3 to 4 feet.
" Pinsapo, large and handsome, 3 and 4 feet.
" Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.
" nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.
" Weareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.
" aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season

TEXIAN FLOWER SEEDS, ETC.,
TO BE HAD OF
JAMES CARTER, SEEDSMAN and FLORIST,
No. 238, High Holborn, London.

The following unique collection of Flower Seeds and Bulbs from Texas, the Garden of the New World, comprises the principal novelties of the season. Some of the species being undoubtedly new, have not yet been named or figured. Several of the following were introduced last year. An extensive Catalogue of Flower Seeds may be had gratis and pre-paid on application.

TEXIAN FLOWER SEEDS.
Per packet.—s. d.

A beautiful white shrub ...	1 0
A do. do., purple, fragrant...	1 0
A do. do., rose, fragrant ...	1 0
A do. do., yellow, fragrant	1 0
A curious Shrubby Plant...	1 0
Evergreen Shrub	1 0
A yellow flowered Annual ..	1 0
A pink do. do.	2 6
Ipomœa sp., red centre ...	1 0
" striped flowered	1 0
" sp. variabilis ...	1 0
A globular-flowered Annual	2 6
Texian Sunflower (?) ...	1 0
A pretty blue flower ...	1 0
A do. white do.	1 0
A scarlet climbing Plant ...	1 0
A new purple flower ...	2 6
A do. purple and white ...	1 0
A do. scarlet	1 0
A very curious Plant ...	1 0
Texian Cacti	1 0

TEXIAN BULBS.—Each.

Texian Lilies, white and pink	1 0

TEXIAN THORNS.
These are highly recommended for ornamental fences.
SEED. Per packet.—s. d.

White Evergreen Thorn ..	1 0
Do., flowers 3 times a year	1 0
Do. yellow Berries	1 0

Trade packets of 5s., 10s., and 20s. each, may also be had of the above three Texian Thorns.

TEXIAN GRASS.

A gigantic Evergreen Grass	1 0
An excellent Grass either for Pasture or Hay; highly recommended to agriculturists	1 0

NEW TEXIAN GRAIN.
Different from all the sorts cultivated in England; produces two crops in Texas 1 0
The entire collection of Seeds, 1l. 5s.

CACTI.—Very fine specimens, prices various.

TO ROSE GROWERS AND AMATEURS.

J. CARTER has also received ROSE SEED from a correspondent in Italy, who possesses a first-rate collection of the most beautiful Roses, comprising 500 varieties, and including some of the novelties of last season. The seed is perfectly well ripened, and having been partly hybridised, new and beautiful sorts may be raised from it. It consists of Bourbon, Noisette, Moss, Tea, &c. Price, per large packet, all the sorts mixed, 20s.; Smaller do. do., 5s. The following may be had separate:—Moss, Tea (including Purpurea rubra), Hybrid, Remontants, Bourbon, Noisette, each 2s. 6d. per packet. Roses commonly flower the second year; in Italy frequently the first.

Also from the same correspondent Seeds of splendid CARNATIONS and PICOTEES, warranted at the following prices, per packet:—New Fancy Carnation, 5s. and 10s.; fine mixed Carnation, 2s. 6d. and 5s.; fine mixed Picotee, 2s. 6d. and 5s.

☞ CARTER'S new Giant Scarlet Runners, per quart ... 2s. 6d.

NOTICE.

THE ADMINISTRATORS of the late JOSEPH FAIRBAIRN, of Clapham, Nurseryman and Seedsman, beg most respectfully to call the attention of Noblemen, Gentlemen, Amateurs, and the Trade, to their varied and extensive Stock of STOVE and GREENHOUSE PLANTS, particularly to their Ericas, Azaleas, and Aphelexis, which are all now in high perfection; also their Shrubs and soft-wooded Plants for Parterre and Border Planting in every variety. They beg to return their grateful thanks for the patronage so long bestowed on the old established Firm of JAMES & JOSEPH FAIRBAIRN, and afterwards on JOSEPH FAIRBAIRN alone; and to state that all Orders will receive their prompt and best attention, and they are prepared to do Business on such liberal terms, for Cash, as they trust will insure a continuance of such patronage.

Clapham Nurseries, near London, April 22.

EAGLE AND HENDERSON, SEEDSMEN, NURSERYMEN, and FLORISTS to the QUEEN, from 81, George Street, Edinburgh, to the Seed Warehouse, at the Nursery Gate, Leith Walk. AGRICULTURAL SEEDS.

LIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. 4s. per gallon, sufficient to make four. For testimonials see back leaf *Gardeners' Chronicle*, March 11, 1854.

GARDEN AND AGRICULTURAL SEEDS, first quality, and lowest market price.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

TURNIP SEEDS.

THE SUBSCRIBERS are now selling, from a large and carefully selected Stock, the following varieties of TURNIP SEEDS. Prices are moderate.

SWEDES.—Skirving's Purple Top. (*On strong clays or other heavy soils no variety of Swede will produce so bulky a crop as this.*)
" Lothian Purple Top. (*An established well known sort, rounder shape than Skirving's, and does not grow so much to "long necks."*)
" Hardy Green Crop. (*There is nothing to equal this variety for* mellow *and* peaty *soils. It is less liable to* ROT *than any other Swede, and it possesses excellent feeding properties, being crisp, juicy, and sweet.*)
" Laing's Improved. (*A beautiful shaped bulb, and on rich loamy soil yields a great crop, but is not equal in hardiness to any of the preceding.*)

YELLOWS.—Green Top, or Aberdeen Bullock—Improved Stock. (*It is questionable if there be a better Yellow Turnip than this, provided it be grown from a properly selected stock; it has, however, above all others, a too many instances, disappointed the farmer in consequence of the spurious character it has assumed through a bad stock of seed, which, instead of giving a heavy crop of large well shaped bulbs, with moderate sized tops, produce only stunted small bulbs with a profusion of large coarse tops.*)
" Improved Purple Top Aberdeen—Skirving's variety. (*A very superior sort, yielding a heavy crop, but is not considered equal in hardiness to the preceding.*)
" Dale's Hybrid. (*Yields a very heavy crop, and is a first-rate kind for early winter consumption. From the bulbs growing considerably above ground, it is well adapted for sheep-feeding.*)
" Improved Early. (*A superior sort; bulbs large and finely shaped, with small top and tap root. Unless wanted for early use it should not be sown till the end of June, and sowing may be continued up to the middle of July, with the certainty of having a good crop.*)

WHITES.—Large Globe,
" " Green Globe Imperial. (*A superior hardy sort.*)
" " Red Globe.

Priced Lists of the above, with every other description of Farm Seeds, may be had on application, post free.

All parcels of Seeds are delivered carriage free to the principal Railway Stations and Shipping Ports throughout the kingdom.

W. DRUMMOND & SONS, Seedsmen, Stirling, N. B.

CALCEOLARIAS FOR BEDDING.—The following four very handsome varieties will be found the gems of the season for bedding purposes, at 12s. per dozen.

CRIMSON KING (Henderson), deep crimson, very dark and rich, and does not fade; habit dwarf and robust, flowers large, and shape good.

MAGNIFICENT (Henderson), rich crimson, with yellow crown; a large, fine-formed, and very splendid flower, quite distinct from anything yet out.

GOLD CHAIN, fine golden yellow, of great substance and fine habit, with very stout foot-stalks.

GOLD CAP (Garraway), rich dark maroon, the upper division of the flower deep gold colour, the flowers large and of fine compact habit.

Also the following older favourites for bedding:—

BEAUTY OF MONTREAL, fine bright crimson, dwarf habit, 6s. per dozen.

WELLINGTON HERO, rich deep golden yellow, 6s. per dozen.

SULTAN, large rich crimson, 6s. per dozen.

MRS. BEECHER STOWE, fine canary, 9s. per dozen.

SULPHUREA SPLENDENS, fine yellow, dwf. habit, 6s. per doz.

Calceolarias (Seedlings not yet flowered) raised from "Benary's" superb spotted varieties, 5s. per dozen, post free.

CARNATIONS AND PICOTEES.—Beautiful selections from our extensive collection, at 18s., 24s., and 30s. per dozen pairs; fine mixed, for borders, 9s. per dozen pairs. True Old Clove Carnation, 12s. per dozen pairs.

PINKS.—Extra fine sorts by name, 9s. to 12s. per dozen pairs.

PANSIES.—The following choice kinds, at 10s. per dozen varieties:—Alba Superba, Androcles, Blanche, Cæsar, Calysto, Caroline, Commander-in-Chief, Crystal Palace, Drusilla, Duchess of Rutland, Elegant, Emma, Euphemia, Glory, Helen, Heroine, Indian Chief, Isabella, Junius, Lady Carrington, Lady Franklin, Lady Harding, Lord Jeffery, Marchioness of Lothian, Masterpiece, Miriam, Miss Talbot, Mrs. Beck, Penelope, Polyphema, Post Captain, Prince Arthur, Princess, Queen of England, Rubens, Sambo, Smolensko, The Rajah, Uttoxeter Hero, Viceroy, Yellow Prince.

CHRYSANTHEMUMS, comprising the very best of the new kinds of large flowering and Pompon varieties, in strong plants, 9s. per dozen.

30 packets of Choice Flower Seeds, per post free, for 5s.

For immediate effect in decorating the Greenhouse, Conservatory, and Flower Garden, YOUELL & Co. *beg to refer to their advertisements of March 25, April 1 and 8.*

☞ Less quantities than those named above supplied at the same prices. Orders of 2l. and upwards are delivered Carriage Free to any Railway Station within 150 miles of the Nursery.

YOUELL & Co., Royal Nursery, Great Yarmouth.

The Gardeners' Chronicle.

SATURDAY, APRIL 22, 1854.

THE lecture delivered lately in the Royal Institution, a report of which has been given in our columns (p. 183) has again directed attention to what are called WARDIAN CASES. On many former occasions the subject has been discussed; but we still find so much misconception as to the real horticultural value of this invention, that we venture once more to address ourselves to its consideration.

If the more enthusiastic admirers of WARDIAN cases are to be trusted, the whole art of horticulture is illuminated by the lustre they shed upon it. We are told that it is merely necessary to put a plant into such a contrivance, and, *presto*, the care of a gardener becomes superfluous; the vigour of health is imparted to the sickly constitution; the most deteriorated atmosphere becomes genial; and a back window in a dingy London court becomes

redolent of country lanes and verdant meadows. We have even known attempts made by speculative gardeners to convert their conservatories and hothouses into WARDIAN cases upon a gigantic scale. It is because all this is a great mistake that it becomes desirable to indicate once more what a WARDIAN case is, what it can do, and what it cannot do; for most assuredly it can do none of those things expected from it by the more eager of its friends.

In saying this we mean no disrespect whatever to the invention. We would not disparage it in the slightest degree. On the contrary, rightly used, and correctly understood, it is an excellent adjunct to horticulture. But it is one, the value of which is much exaggerated, or at least misunderstood.

When Mr. WARD first remarked a Grass and a Moss growing inside a damp bottle, he merely saw what gardeners had witnessed for a couple of centuries at least. He beheld the propagator's bell glass with its edges dipping into wet sand: a close cavity, with transparent sides, and an interior possessing an uniform and unchangeable degree of humidity. Thirty or forty years since, and probably long before, the same principle was employed in the drawing-rooms of the wealthy for the preservation of the freshness of cut flowers; the flowers were placed in a vase; the vase stood in water, and a bell-glass, dipping its edges into the water, covered the whole. There is not the smallest difference in principle between these old contrivances and the modern WARDIAN case.

But all such plans were merely preservative; no one thought of cultivating plants in close cases, though they found the latter invaluable for keeping plants alive. A cutting under a bell-glass was surrounded with moist air until it had formed roots; but the moment the action of roots was secured it was transferred to the open air. Gardeners never dreamed of growing a cutting under a bell-glass, even though the bell-glass were as capacious as the dome of St. Paul's.

What Mr. WARD did, when he proposed the case that bears his name, was to contrive a large portable bell-glass and its supporter, made of materials strong enough to bear the rough usage of a sea voyage. He demonstrated the defects of the old travelling greenhouses, and suggested a sure remedy, pointing out at the same time upon what principles the remedy depended. That principle was—1st, to expose plants to light, and—2d, to ensure their being constantly surrounded by a medium damp enough to keep their system in a state of activity. The old travelling greenhouses, or plant cases, were open at the joints, and the water originally contained in them quickly evaporated, leaving a mass of parched earth in which no vegetation could long survive; they were also glazed with talc, or oyster shells, or other half-opaque materials, through which no such amount of light could pass as plants require for the preservation of their vitality. When properly constructed, the WARDIAN case answers perfectly as a means of transporting plants to great distances.

It also has its value in places where the air is filled with floating soot or dust; or where it is naturally too dry for vegetation, as in sitting rooms. There the lives of certain kinds of plants may be maintained for a long period of time, with the appearance of health; shade-loving races, such as Ferns and Mosses, will even thrive there; and others, like dry Crocuses and Hyacinths, which have been previously made ready by the usual processes, out of doors, may be led to blossom in perfection for a season, or in some instances for more.

We shall be told no doubt that plants have been made to grow well, and flourish exceedingly in WARDIAN cases. To that statement we lend an incredulous ear. It will be always found, upon inquiry, that such cases are opened daily and ventilated freely, and thus, or otherwise, relieved from the moisture with which the air is saturated. But those are not WARDIAN cases at all; they are merely greenhouses on a small scale, in which plants grow well or ill, according to the care and skill with which they are managed. A WARDIAN case demands neither care nor skill; its operation is essentially automatic; it is its own gardener in every way. The moment its structure enables the possessor to give it daily attention—in short, to cultivate the plants within it, it ceases to be a WARDIAN, and may as well be called a SMITHIAN, or a BLACKIAN case.

The truth is, that plants cannot be cultivated in the absence of the freest access to light and to air in motion. The more rapid the motion, within certain limits, the higher the health of plants, and *vice versâ*. This is the very foundation of good gardening; and it is precisely this which is unattainable in a WARDIAN case. This is the exact opposite of a natural condition; but plants demand all the resemblance to natural conditions which is to be secured by art. In a WARDIAN case plants are in a state of semi-suffocation. In nature they breathe freely. Direct, constant, and most unrestrained communication with air, perpetually striking and then quitting them, is as necessary to a plant as to an animal; and that the WARDIAN case is intended to render impossible.

We venture to add that so far as gardening, properly so called, is concerned, the WARDIAN case has done nothing more than was effected years before it was suggested. As a convenient means of enabling plants to support existence under difficult circumstances it has value; and that is all. In short, it is to plants what *tripe de roche*, Barkbread and Fern-root are to man—a means of prolonging life under difficult circumstances.

IT must be evident, from the valuable series of experiments recorded by Mr. LAWES (at p. 214), that all our tables of the downfall of rain are essentially wrong, and that no results hitherto obtained by the RAIN-GAUGE can be taken to represent the truth, or anything like it. It is clear that meteorologists have been groping in the dark, and misleading everybody. Their instruments neither indicate, with even tolerable precision, the quantity of rain which falls, nor the number of days on which it falls. The last error is as unfortunate as the first, for we have no longer an indication of the length of time during which the air is charged with vapour ready to be precipitated. A whole year's rain near London may be equalled by that of a week in Persia; and figures which express the general annual result of such extreme cases tell the cultivator nothing; no distinction is made between occasional torrents and a steady deposit throughout the year. But if we know that in the one case there are 200 days in which rain was measured, and in the other only 20, we perceive immediately that the one must be a damp, and the other an extremely dry region.

The small rain gauge used by Mr. LAWES asserted that he had in 1853 only 150 days on which rain fell, and this indicated a season dry for England. But the large gauge declared that the number of days was 249, and that the season was unusually wet; as we know it was. And this explained why, even in the absence of rain, there was so little dryness; for it is clear that with 249 days on which moisture was able to condense, there could have been very little evaporation from the surface of the soil.

It cannot be alleged that the indications by the large gauge used at Rothamsted were in excess of the truth; it could not indicate more than occurred. Condensation may have done something, or it may have indicated less; and so far may be regarded as not being quite trustworthy. No doubt it is to some extent inaccurate; but its inaccuracy can bear no sort of comparison with that of the little instruments now in use.

That the existing apparatus must be all altered seems certain. In what way it can be best altered requires consideration; and we hope to receive suggestions from our meteorological readers; for in Great Britain the fall of rain is, of all natural phenomena, that which has the most direct influence over our climate.

Imagine a gardener or farmer, accustomed to the dry climate of the Eastern counties, seeing in a Galway journal, kept from a 4-inch gauge, that there was not an inch more rain there than in Norfolk, and proceeding to the West of Ireland, with dry land husbandry at his fingers' ends, and nothing more. What would he do in a perpetual drizzle, with the routine that he had been accustomed to, and with no science to rely upon, as might very well happen. Such a man would have been thankful if he had never heard of a rain gauge, or allowed himself to be allured by the seduction of what is called philosophy.

A rain gauge, to be of any value, should indicate the total deposition of moisture on a certain horizontal area, and hence afford the means of calculating, by weight or measure, the quantity of water which falls in the locality or part of the country in which the instrument is placed.

The utility of rain gauges may be questioned by some persons, who may suppose that registers of the amount of rain are merely to be looked upon as matters of curiosity. But even with all their present imperfections, they are no doubt of considerable value. This is well illustrated by the following undoubted fact: After an extraordinary inundation from the overflowing of the Saône, in 1840, a society was formed to take into account the rising of the waters in connection with the fall of rain in the basin of that river. The quantity of rain and snow was registered at 33 stations, and the relation between the fall of rain and swell of the river was carefully observed. On the 9th of December, 1845, the Mayor of Lyons was informed by the Commission, in consequence of intelligence received from observers at Montbéliard and Dole, that the Saône would most probably rise to the height of 18 feet, at the bridge of La Feuillée, on the evening of the 12th or morning of the 13th of December. The flood did come; and it rose early on the morning of the 13th to the height of 17 feet 4 inches. Thus, it appears, that the authorities at Lyons had three days' notice of the approaching flood, in which time the lives and property of the inhabitants could be placed in comparative security. The time of greatest danger, and also the safety level, were pointed out with astonishing accuracy, considering the distance between the source of information and the city of Lyons. The time was within the limits stated, and the height to which the water rose was within eight inches of the point which it was calculated to attain. The source of information was, in fact, the rain gauge; and if this instrument has not proved useful in cases of inundations occurring in this country, as well as in that just mentioned, there is certainly no reason why it should not.

We all know, moreover, that the indications of the rain gauge are usefully consulted in determining the system of drainage which should be adopted in different localities, receiving different quantities of rain in the course of the year. When it is ascertained that in one place the amount of rain is, on the average, 40 inches per annum, and in another only 24 inches, it is evident that the area of the pipes, and the number of drain-outlets, ought to be much greater in the one case than in the other.

But if the indications of the rain gauge are useful in such respects, it cannot be denied that these indications should be correct; nevertheless, as has been seen, differently constructed gauges do not give, under similar circumstances, the same results; and the question is, by what means can a correct uniformity be established? Attention was called to the discrepancy between the amounts collected in large and small gauges by Mr. LAWES, at pp. 180 and 245, of last year's *Chronicle*, and at p. 198 of the volume for the same year, our correspondent, "T. S. P.," states that at H. M. Dockyard, Pembroke, an 8-inch gauge received, in the course of 11 months, upwards of 2½ inches more depth of rain than was received by a 5-inch gauge. Of the accuracy of both observers no doubt can be entertained. And now we have a startling announcement by Mr. LAWES of the amounts collected in a gauge equal in area to the $\frac{1}{1000}$ part of an acre, and in one of the ordinary size. He has shown that the difference was upwards of 5¼ inches in 12 months, the greater depth being indicated by the larger gauge, and this was the case in every month throughout the year. It is to be observed, however, that the discrepancy was not uniformly equal, and therefore no uniform correction can be applicable. It may, indeed, be concluded, that, as an 8-inch gauge gave a greater return than a 5-inch, so if we employ one of not less than 12 inches, we shall obtain a closer approximation to the actual amount of rain which falls on the surface of the ground. The error in that case would perhaps be small; and if that convenient size were generally adopted, the indications in different localities might, at all events, be considered strictly comparable, as well as sufficiently correct for practical purposes. In the meantime, it is desirable that experiments should be made as regards the quantity received on the same day by a 4, 8, and 12-inch gauge, in order to ascertain whether their differences are in any direct ratio. But upon this and other points we hope to be favoured with the views of our correspondents.

VEGETABLE PATHOLOGY.—No. XVI.

65. PITH, however, though destitute of spiral vessels is by no means a perfectly homogeneous substance Besides the part which is popularly known by that name, there is a cylinder composed of a close tissue, sometimes quite ligneous, though consisting of parenchym, which surrounds it, varying in colour in different plants, and forming tranverse partitions, sometimes, as in the Vine,* at each bud, sometimes of more frequent occurrence, as in the Magnolia, and endowed with a far higher degree of vitality than the substance which it surrounds. It is with this cylinder that the normal buds are more immediately in contact, and from this spring the medullary rays. Threads of this sometimes penetrate the central pith, as in the Apple; and occasionally, instead of such threads, there are mucous ducts, as in the Lime tree. At the base of the nascent pith of the young bud, corresponding with the cicatrices immediately below it, there is a portion of a loose consistence, which becomes discoloured more or less rapidly when in contact with the air. To this M. Guillard gives the name of *möelle marcescente*, or *möelle morte*. It has a different construction from the

* If a young pushing bud of the Vine be examined, the transverse partitions are perfectly visible, while the whole mass is soft and tender. The various modifications assumed by the central pith may be studied in Guilliard's memoir, in "Annales des Sciences Naturelles," Nov., 1847.

ordinary central pith, not being arranged evidently in lines,* but forming an irregular network. It is not impossible that this portion, which is apparently in a state of incipient decomposition, may act as a stimulus to the young bud, exactly as the brown matter in the Potato murrain causes diseased tubers to push more rapidly than in those which are sound.†

66. The normal buds, as distinguished from the adventitious buds, as said above, proceed from the annular pith, whether in immediate connection with a transverse partition of this pith or not. In essential characters all are similar, whether lateral or terminal, consisting of an indefinite number of leaves, or modifications of leaves, with a cone of young pith at the base, and below this, a short cylinder of a distinct substance. The growth of the stem is dependent on the evolution of the buds, and its increase bears a certain proportion to their number and activity. Where the lower branches, therefore, of a tree are constantly pruned off, without any reasonable consideration of the exigencies of a tree, the growth is always proportionally scanty; and, in many cases, if nature did not supply the loss by the production of adventitious buds, the health of the tree, and its general strength, would be materially impaired.

67. That the growth of the stem is in strict dependence on the vigour and number of the buds, will not admit of question. A theory has long prevailed that the wood is, in fact, the product of the buds, being nothing more than their descending roots, which, with a rapidity comparable to that of lightning, run through the whole extent of the tallest stems. No theory, perhaps, has been more strenuously defended and opposed, especially in France, or with greater ability on both sides; but strangely enough, with the death of M. Gaudichaud—its warmest advocate—it seems destined, notwithstanding very weighty theoretical arguments, to pass into comparative neglect. M. Trécul, more especially, has of late devoted his attention to the subject, and by a careful investigation of the reproduction of wood on denuded surfaces, has proved, almost beyond the possibility of doubt, that when they are protected from atmospheric agency, the terminal cells of the medullary rays, and the young external cells of the alburnum, are capable of increase, and that the tissue thus produced resolves itself after a time into bark and wood, with all the peculiarities of the original tissue. This resolution, in consequence of which a tissue, at first centrifugal, is divided into two portions, increasing in opposite directions, is amongst the mysteries of vital action, which, like many others, will probably never be fully understood.

68. When one variety or species is grafted on another, though the buds are entirely confined to the graft, the wood of the graft and stock respectively retains its own peculiar characters, which could not be the case if produced by roots descending from the buds. To a certain degree, however, the graft or stock‡ is modified as regards luxuriance and fertility; and on the proper accommodation of the stock to the graft mainly depends the complete success of the cultivator. Seedling varieties, for instance, which are worthless, either from delicacy of constitution or other bad qualities, on their own roots, are highly improved by grafting on suitable stocks. Such modifications depend upon the alteration which the sap has sustained in passing through the stock in its way to the graft, an alteration which, though probably altogether inappreciable to any means of analysis which we possess, has no mean influence on tissues destined originally to convey a different fluid, though different to so slight a degree.

69. It is probable, owing to some analogous cause, that grafting is only practicable within certain limits. Between plants of different natural orders an union is, we believe, never possible; but even in varieties of the same species, as in the Rose, the life of many varieties is of very limited duration, except on highly favourable stocks, and the same may be said of most unions between plants not very closely allied.

70. If the effect of a slight change in the sap is capable of producing such effects on the graft, it need not be matter of surprise if any material change in the constitution of the soil should be capable of inducing a canker or death. *M. J. B.*

OLDENLANDIA DEPPEANA.

The clusters of delicate little star-shaped white blossoms which terminate every shoot of this plant, its compact growth and habit of blooming almost perpetually, render it a very valuable subject for decorative purposes, and it is somewhat singular that it is not more generally grown than it appears to be; but its tendency to be continually in bloom, rendering some trouble and attention necessary to obtain specimens of any size, has probably led to the neglect with which this plant is now treated. It is, however, not subject to insects, and is quite at home in any warm shady corner while making its growth, such as would be unsuitable for the majority of plants; and the little time necessary to remove the flowers as they appear is well repaid by their abundance and long duration, when good sized plants have been once obtained.

Cuttings of the young wood, planted in sandy soil, covered with a bell-glass and placed in a gentle bottom-heat, root freely. When well rooted they should be potted singly in small pots, placing them in a rather warm close moist shady situation until they get well established. Beginners, however, will save time by procuring young plants, with which to commence, from the nursery; and they are not expensive. Plants procured at the present time will, with good management, form nice little specimens in course of the season, and will be useful for blooming in a rather warm house during the winter. When received they should be placed in a close pit, where they can be afforded a moist atmosphere, and shaded from bright sunshine. As soon as the pots are found to be moderately well filled with active roots shift into others two sizes larger, using rich fibry peat and light mellow turfy sandy loam, in about the proportion of two parts of the former to one part of the latter. The peat and loam should be nicely broken up, rejecting all but the prime, and be carefully mixed with a sufficient quantity of clean sharp silver sand, and a sprinkling of lumpy bits of charcoal or small potsherds. Water carefully for a few weeks after potting, keeping the atmosphere moist, and syringe over-head frequently. When free growth is once obtained a liberal supply of water will be necessary; but it will be easy to give too much just after potting, and if the plants are allowed to get into indifferent health it will be difficult to induce anything like free growth during the season. The blossoms must be removed as they appear, and the plants should be shaded from bright sunshine, affording a moist atmosphere, which will assist in checking their tendency to produce flowers; and if they can be placed in a cold pit after about the middle or end of May, they will be more at home than where artificial heat is used, but the pit must be kept rather close, otherwise the temperature will not be sufficiently warm to induce active growth. A second shift will probably be required about midsummer, and this must be attended to, shifting as soon as the roots require more space, but not until then.

If large specimens are desired it will be necessary to prevent their blooming this season at least, and to keep them growing as actively as possible. They should be removed to a warm corner of the greenhouse before damp cold weather sets in in autumn, giving very little water to the soil, so as to get the wood well ripened. As early in spring as it may be convenient to afford them a situation favourable to growth, remove them to it, and attend to potting and stopping, &c., as directed for last season, until specimens of the desired size are obtained. When this is the case they may be allowed to bloom, and may be removed to the conservatory while in flower, supplying them with weak clear manure water, if the pots are well filled with roots. By stopping the plants when the flowers decay, and removing them to a warmer situation for a few weeks, they will produce a second lot of their pretty little blossoms; or, if they are afforded a warm corner, they will go on growing and flowering for months. This exhausts the plants, however, and it is advisable to allow them a short period of rest after the beauty of the principal portion of their flowers is over. *Alpha.*

MAJOR CUNNINGHAM'S "LADAK."

In the seventh volume of the Transactions of the Horticultural Society of Calcutta, 1850, appeared the supplement to an essay on the Coniferæ of the N. W. Himalaya, published several years before in a local journal of North-western India. In this supplement occur the following passage and note.

"According to Dr. Lindley in the 'Penny Cyclopædia' (copied in the 'Arboretum Brit.,' iv. 2429), two varieties or perhaps nearly allied species (of Cedar) called Shinlik and Christa Rooroo are mentioned by Moorcroft as natives of the forests of Ludakh (if any such there be); but the inhospitable soil and climate of the Tibetan table land (where it freezes more or less every night in the year), must form an impassable barrier to the transverse progress of this and other Himalayan Coniferæ, excepting, perhaps, Juniperus excelsa." A surmise quite confirmed by the researches of Dr. Thomson, who found that the Deodar Cedar does not extend beyond Soongnum in Kanaur, and is unknown in Tibet and Ladak. The note to the qualification, "if any such there be," is this: "This proviso is very necessary. I know not what materials Dr. Lindley consulted, but in the expurgated edition of Moorcroft's Travels, published by Professor Wilson, so far from any forest or Cedar of any kind being mentioned, I find (I. 267) that "a few Willows and Poplars are the only trees" in Ludakh. This is confirmed by Mr. Vigne (II. 342), with the exception of his "here and there a bunch of Fir trees" in the neighbourhood of Le, which, on the authority of Captain H. Strachey, I eliminate, as being imaginary. Captain S. assures me that the only trees are the Lombardy and a Balsam Poplar, Willows, Brier bushes, and Hippophäe by the rivers. To these must be added Juniperus excelsa, which, however, does not occur within 20 miles of Le, and is called Shookpa. In spite of the discrepancy of name, I concluded this to be Moorcroft's Cedar, *i. e.*, Pencil Cedar or Juniper, and understood by Dr. L. of the Deodar. But by comparing Moorcroft's volumes* (I. 287, 289), it is clear that Christa Rooroo is not a Cedar at all, but doubtless Hippophae conferta (salicifolia), or some allied species; "a prickly shrub called Cheerma and Chesta Ruru," growing by streams, and producing a small round orange berry, "too acid to be eaten." As Chesta Rooroo is "a variety or perhaps nearly allied species" of the second Ludakh Cedar, it follows that the last, "Shinlik," must belong to the same family, probably the "Sunjit"† or "Sarsing," (properly Sershing, or gold tree), Elæagnus Moorcrofti, which also grows in Ludakh and Kashmeer, and of which Dr. Royle (in Vigne II., 456) mentions a Kabul variety, "Singilla," which might easily in transcription become "Shinjik." "Chirma," in Tibetan, denotes any Thorn, properly Tserma.

"The Hippophae forms the most abundant brushwood of the river-beds in Ludakh, and though so common as to fix the notice of all travellers, has been nevertheless the subject of a second series of mistakes on the part of Mr. Vigne. He tells us (II. 360) that at a certain spot in the Nubra Valley of Ludakh, 'a long belt of jungle, chiefly of the Tartarian furze, occupies the banks of the river;' and in pp. 268, 269, 272, 319, as well as engraved on the map, near Khoppalu, on the Shayuk, the same shrub, explained to be Cytisus Gerardiana or versicolor, is said to occur in thick jungles on the stony and sandy banks of streams in Shighur and other parts of Baltistan. These are exactly the localities where we should expect Hippophäe, while their comparatively small elevation would naturally induce a doubt of the presence of Caragana versicolor. But the matter does not rest on inference. Captain Strachey has visited the Nubra site, and he assures me that the shrub there is Hippophäe; and so of course the rest."

Major Cunningham, in his work on Ladak, recently published, remarks (p. 218) on the above, thus:—

"Captain Madden, in the Horticultural Society's Journal, has quoted a passage from Moorcroft, to the effect that 'a few Willows and Poplars are the only trees in Ladak,' and he then produces the authority of Captain H. Strachey to show that Moorcroft was wrong. But the fact is, that Moorcroft is right in what he does say, for either Captain Madden or Captain Strachey has misquoted him. In his 'Travels,' I. p. 267, Moorcroft distinctly states that Willows and Poplars are the only timber trees in Ladak; and in I. p. 306, he repeats the same thing. But in both places he says timber trees; and he is right; for the Shukpa (Shug-pa) is too small a tree to yield timber, although, if not held sacred, it might yield wood for boxes. Captain Madden should have recollected that the Ser-shing had been first described by Moorcroft, and was therefore named Elæagnus Moorcrofti."

Now, how stands the question between us? The manifest object of my statement is to show that:—

1. There are not any forests,‡ or Deodar Cedars, in Ladak; and that Moorcroft's published journals on this point will not bear out the facts stated in the "Penny Cyclopædia" on his authority. [Upon this we must remark that, in the "Penny Cyclopædia," Dr. Lindley expressly states that the notes of Moorcroft to which he refers are those published under "Deodar," in Lambert's Monograph of the genus Pinus.]

2. That the plants supposed to be varieties or species of Cedrus are, in fact, a Hippophäe and Elæagnus Moorcrofti.

3. That Mr. Vigne has fallen into several mistakes in his enumeration of the plants of that country. These three points are, I think, satisfactorily established.

The most superficial examination of the passage suffices to prove that "the authority of Captain H. Strachey" is produced to show that it is Mr. Vigne, not Moorcroft, who is wrong: and that Captain Strachey quite confirms Moorcroft. It is true that Moorcroft's words are forest-trees, but as, on his own showing, there are no forests, his obvious meaning is, large trees. And, as I have already said, they were cited by me as right, not as wrong.

The drift of Major Cunningham's concluding sentence it is not easy to gather, for reference is made by me to the Elæagnus; and I can only conclude that he has either wholly misapprehended what I wrote; or, what is more probable, that he has referred to it from memory, and, owing to mere carelessness, has imputed to Captain H. Strachey and myself ideas exactly the reverse of those we really held. *Edward Madden, Clifton, April 7.*

Home Correspondence.

Effects of the late Winter.—The temperature here, on January 3d, 1854, fell 4° below zero, and on the Grass 6° below zero, whilst in the valley in the neighbourhood it was 8° below zero. From our own grounds we have cut down above a hundred cart-loads of dead trees within the last month. Cedrus Deodara, every leaf fallen off

* Such at least is the case in the instances which we have examined, and as mentioned by Guillard. The term möelle merte is very inappropriate, for the duration of its life far exceeds that of the central pith, as a section through a four years' shoot of the Horse Chestnut will at once demonstrate. A section of the same tree shows also very clearly the exact agreement in the tint assumed by this portion of the pith, when exposed to the air, with diseased or wounded parts. In every case which we have examined, it has a strong acid reaction on litmus paper.

† A curious case of disease which is now ravaging the Gooseberries and Currants in the neighbourhood of London, characterised in its early stages by a precocious pushing of the buds, has just been communicated to us by Mr. R. Thompson. In a plantation of at least 5000, consisting of Keens' Seedling Gooseberries, far the greater part is worthless. The diseased plants sprout earlier than the others, but soon perish; the roots, meanwhile, are perfectly healthy, but the wood, when cut across, shows an appearance exactly like that in Apples destroyed by canker. The inner bark suffers more rapidly than the rest, and is full of little black specks, which show exactly the organisation of the perithecium of many species of Sphæria. A more minute description of the disease must be reserved till we arrive at that portion of our treatise which relates to individual diseases.

‡ Disease, for instance, as in the case of variegation, may be communicated by the graft to the stock.

* Q. I. 299, 300?

† Elæagnus orientalis is called Zinzeyd in Persia (*vide* "Vegetable Kingdom," 257). Evidently a corrupt reading for "Sunjit."

‡ Of this paucity of vegetation Major Cunningham's work affords abundant proof; to the indigenous plants enumerated by me he only adds a Tamarisk; and does not mention the Hippophäe.

and some boughs killed, but the plants are recovering rapidly; Cedar of Lebanon, slightly injured; Mount Atlas Cedar, injured; Aucuba japonica, much injured, some plants killed to the ground; Viburnum Tinus almost all killed, the bark of the thick wood having been burst by the frost; Arbutus Unedo, all killed, some specimens were 30 years old, the bark forced off the trees by the frost; Pinus Cembra, not injured; P. excelsa, slightly injured; P. insignis, injured; P. Lambertiana, slightly injured; P. Laricio, slightly injured; P. Pinaster, not injured; P. Pinea, injured; Larix pendula, not injured; Abies canadensis, not injured; A. cephalonica, not injured; A. Menziesi, not injured; A. Morinda, not injured; A. Nordmaniana, not injured; A. Pindrow, not injured; A. Pinsapo, not injured; Araucaria imbricata, many killed; Quercus suber, much injured; Q. ilex (evergreen Oak), many killed, some plants 50 years old dead; Erica mediterranea, much injured; Ilex Aquifolium, many killed, all more or less injured, mostly the lower 6 feet of the trees are quite dead, making nearly all the trees standards; Cupressus funebris, much injured; C. Goveniana, ditto; C. horizontalis, ditto; C. thurifera, killed; C. torulosa, killed; Cryptomeria japonica, not injured; Yucca gloriosa, very much injured, all the branches killed, together with a portion of the stem; Buxus chinensis, killed; B. argentea, injured; Cerasus lusitanica, many killed; Laurus nobilis, killed; L. regalis, many killed; Roses, China and Tea-scented, many killed; Libocedrus chilensis, injured; Hedera Helix, injured; Ulex europæus, many killed; U. e. flore pleno, ditto; Ligustrum vulgare, injured; Alexandrian Laurel, much injured; Phillyrea angustifolia, trees 20 years old, killed; P. media, ditto; Juniperus chinensis, not injured; J. communis, injured; J. excelsa, uninjured; J. recurva, ditto; J. Sabina, much injured; Taxodium sempervirens, scarcely injured; Tulip tree, slightly injured; Rhododendrons, many killed, and even the Pontic varieties injured; Garrya elliptica, nearly killed; G. laurifolia, killed; Yew (common), some injured; Walnut, ditto. Bees in many hives frozen to death, with nearly 20 lbs. of honey in them. I might have swollen this list, but the above will be sufficient to show that we have not, for 50 years at least, had such a severe cold. It is worthy of remark that in one place, near Nottingham (Watnal), the Bay tree has not been injured. Probably no part of England has suffered to the extent that we have near here, especially between this place and the Earl of Harrington's and Newark. *E. J. Lowe, Highfield House Observatory, near Nottingham, April* 10.

Trees and Plants of Scripture.—I am greatly in want of some book that may be depended on for a correct description of the trees and plants named in the Bible; our clergyman here is vastly fond of illustrating his subject from natural objects, often plants; and it is truly painful to see an educated man, a public teacher, exhibit such an amount of ignorance on one science, as no doubt often leads many to place but little faith on what he may say of other things of higher moment; it is to stop the perpetual recurrence of those absurdities that I ask you to name some work as an authority, which I will purchase and present to him. *Rodney.* [The best book is Kitto's "Cyclopædia of Biblical Literature," which every clergyman should possess. Gorrie's "Illustration of Scripture," noticed at p. 78 of this volume, is to be depended upon, as far as it goes.]

Pulmonaria angustifolia.—I saw lately in one of its native habitats in Dorsetshire a profusion of this species in a wood; it is so much handsomer than either P. officinalis or mollis of the gardens (P. mollis of Germany is different) that it ought to be introduced; the dark purple contrasts finely with Primrose, Daisy, and Buttercup. *S.*

Mildewed Strawberries.—I observe that one of your correspondents complains of the failure of his first crop of Cuthill's Black Prince Strawberries, from the effects of mildew. The same has occurred here; my gardener fully expected to gather his first crop early in March, and having been recommended to try the Black Prince as the best sort calculated for early forcing, was much disappointed in the fruit not setting, being infected with mildew. Since their removal, I have had in the same house a most abundant supply of Keens' Seedlings in the highest perfection. *R. Hanbury, Poles, Ware.*—The whole of Cuthill's Black Prince that have been forced here have been destroyed by mildew. On February the 10th, 100 pots of Keens' Seedling, and 50 pots of Black Prince, were plunged in a pit with a bottom heat of 70°, close to the glass; they all showed fine blooms, especially the Black Prince; as the blooms began to expand the leaves became attacked with a white mildew, then the fruit stalks and fruit; while the whole of Keens' Seedling were perfectly free from the evil, and ripened good fruit on the 26th of March. Again, on the 20th of March I introduced into the same pit altogether 80 pots of Keens' Seedling, 30 pots of Roseberry, and 18 of Black Prince; the two former kinds are full of fine healthy leaves and fruit, and the Black Prince is completely covered with mildew. The plants are grown singly in 7-inch pots; nearly all were potted at the same time in the same loam, and had the same treatment throughout; they were kept in cold frames through autumn and winter, and forced in a pit glazed with sheet glass 22 oz. to the foot. I have forced here, for the last four years, 500 pots a year, and seldom failed in producing plenty of fruit; and for the failure of Cuthill's Black Prince this year, and not the others, under precisely the same treatment, I am quite at a loss to guess; but such is the case with me. *George Moses, Gardener to Lord Alvanley, Pepper Hall, Catterick, Yorkshire.*—A bed of this variety (Black Prince) in my garden, which had the finest crop of fruit that I ever saw, in July last was suddenly attacked with mildew, which quite destroyed the later portion of the fruit and the foliage. A bed of Myatt's Surprise, only separated by a path, was not in the least affected; neither was any other kind in the garden. *Henry Doubleday, Epping.*—I began to force the Black Prince about five years ago; the first season I was delighted with it, and thought it the best and most prolific of all for forcing; the second season they were nearly as good; the third they mildewed, and the fruit withered without ripening, although other sorts standing alongside of them were perfectly free from mildew; last season I was quite disgusted with them, for they became perfectly white with mildew, and did not ripen a single fruit. I am not, however, easily discomfited; so, this spring I again placed about a dozen pots alongside of my plants of Keens' Seedling, and have thrown them away, completely rotten with mildew; while the plants of Keens' have ripened a nice crop of fruit, are green and fresh, and as healthy as they can be. In the above experiments, the plants of the Black Prince were of the same age and quality as those of Keens' Seedling, and others. *T. R.* [Has sulphur been tried as a cure for this mildew?]

Collodion.—I may mention, as you have been good enough to notice my application of collodion for the propagation of cuttings, that, from some recent experiments on cuttings of such trees as Yews, Junipers, &c, it has not succeeded so well with them; perhaps this was owing to too thick a coating of the solution. However, it is not probable that anything could succeed with every class of plants. In stopping the bleeding of plants I have never as yet found it fail. I have tried gutta percha dissolved in chloroform, and it answers remarkably well. When the series of experiments that I am now trying has been fairly completed, I will write again. *E. J. Lowe, Highfield House Observatory, near Nottingham, April* 10.

The Palmetto.—Could you not get over some Palmetto berries from Charleston? They would be as hardy as the Chinese fan-palm, and as handsome, I conceive; they were recommended for cultivation here by Catesby, who could judge of climate, a hundred years ago. *S.* [We dare say some reader in the southern States of North America, whose eye this catches, will be obliging enough to collect the berries and send them over. They would be very acceptable.]

Fruits and Farinacea the proper Food of Man.—After reading the remarks respecting vegetarians in your review of M. Payen's "Des Substances Alimentaires" (25th Feb.), I felt disposed to solicit the insertion of an immediate reply, but deemed it more prudent to wait till I had procured and perused the work reviewed. This I have now done, and am prepared to show that neither Payen nor any other chemist has recorded a single *fact* opposed to vegetarian principles, or that will warrant the assertion that a mixed diet of animal food and vegetables is superior to one consisting of fruits and farinacea only. No one entertains a higher respect than myself for the talents, labours, and valuable discoveries of such men as Liebig, Playfair, Payen, &c., but I feel assured that some of their physiological inferences are incorrect, and I shall be glad if you will permit me to state, in your impartial journal, my reasons for dissenting from what, I think, they have too hastily assumed as established principles. I do not ask you to open your columns as an arena for discussing the merits or demerits of vegetarianism; but there are several chemico-physiological questions respecting the diet of man and the feeding of animals, which I consider far from being settled, although some chemists have taken for granted that this is the case. The late Dr. Pereira and other eminent writers have suggested the propriety of receiving certain modern doctrines of organic chemistry *cum grano salis*; and even Liebig, in his later writings, betrays a little doubt of the truth of his former statements. I will not trouble you with any direct reply to M. Payen's remarks on the eccentricities of Englishmen and the follies of vegetarians, any further than observing that the very tables which he has constructed with so much care refute his own inferences. Compare the tables at p. 352 with those at p. 349, &c. M. Payen seems, from his observations at p. 385, to have a very imperfect acquaintance with the arguments employed by vegetarians in support of their principles and practice; and the consequences which he foresees from a general adoption of their views are purely imaginary, as a more intimate acquaintance with all the bearings of the subject will show. I may also add that the many years' experience of some hundreds of vegetarians industriously employed in various avocations—literary, scientific and mechanical—should have some weight in the scale against mere hypothesis, or at any rate doubtful inferences. The names and experience can be given of accountants, architects, artists, editors, reporters, barristers, chemists, dentists, gentlemen, merchants, ministers, members of Parliament, physicians, surgeons, professors of music, schoolmasters, solicitors, students, travellers, bakers, blacksmiths, bricklayers, carpenters, clothiers, coopers, cotton-mill operatives, drapers, dyers, engineers, farmers, gardeners, grocers, ironmongers, joiners, labourers, machine makers, moulders, packers, painters, millwrights, printers, saddlers, shoemakers, stonemasons, tailors, warehousemen, and many others now practising the system, who are ready to testify to the beneficial effects they have experienced by a total abstinence from the flesh of animals as food. Some of these have been vegetarians for more than 40 years; some perhaps were so before M. Payen was born; they generally agree in stating that since they commenced their present diet their health has been better, their strength certainly not less, and their capabilities for continuous labour, mental or muscular, much increased; yet M. Payen would have us believe the total inadequacy of such a diet to impart health and strength in such climates as England and France. He says the amount of animal food consumed by the inhabitants of the Alps is not 1-30th of that taken by the inhabitants of the departments of the Seine, yet believes the latter considerably short of what it ought to be. Admitting that M. Payen is correct in his estimate of the amount of azotised and non-azotised principles respectively necessary for renewing the wasted tissues, and fer supporting animal heat, it is no difficult matter to prove that these, in the proportions mentioned, can be as effectually and as economically obtained from the vegetable kingdom alone as from a mixed diet. I believe, however, that strong evidence can be adduced to show that the conclusions arrived at by some chemists on this point are by no means so clear and satisfactory as they represent them; and if you will favour me with a small space in any of the forthcoming Numbers of the *Gardeners' Chronicle*, I will prepare a short paper on the subject. *John Smith, Malton.* [With pleasure, if short.]

Concrete Walks.—An error has inadvertently crept into my article on this subject at p. 216;—for "two-thirds of gravel to one-third quick lime" read—"to six loads of gravel add one chaldron of quick lime." When thoroughly dry, one inch in depth of fine gravel is laid upon the surface, and it is rolled smooth; this effects a considerable saving of the best material, and a much better walk is the result than those made in the usual way. *H. Howlett.*

Potatoed Cuttings.—In the *Bath Chronicle* of the 30th ult., at page 1, col. 1, No. 5006, I find the following article, viz.: "*Singular Mode of Planting.*—We read in *Galignani* that the following mode of planting has been acted on with success by a Bohemian arboriculturist. In place of using the process of grafting, he takes an offshoot of any fruit tree, an Apple tree for instance, and plants it in a Potato, both being carefully placed in the soil so that 5 or 6 inches of the shoot shall be above the ground. This latter takes root, grows with rapidity, and produces the finest fruits." Will you permit me to ask your judgment on the above? Is there, do you think, any reason in it, or any warrant from experience and fact? I have directed my gardener to try it; but I can see plainly that he thinks me on the high road to the county lunatic asylum for giving him such a direction. Why, he reasonably asks, a Potato? why not equally a Turnip? Is it, then, nothing that we vary our stock for different kinds of fruit? Quince for Pear, Crab for Apple, wild Plum for Magnum Bonums? But I will wait for your further instructions, and the expression of your views. *Little Harriett.* [Such inventions are no doubt intended to keep the cutting alive till it strikes root. We have no faith. Doubtless some things will grow under such circumstances, and so they would if the Potato were forgotten.]

Societies.

Horticultural, *April* 18.—J. R. Gowen, Esq., Treasurer, in the chair. Sir W. W. Wynn, Bart., H. Acroyd, Esq., and W. E. Hubbard, Esq., were elected Fellows. The room on this occasion contained a fine display of beautiful objects, and a corresponding number of prizes was carried off, as will be seen presently. Messrs. Standish and Noble, of Bagshot, exhibited a "worked" example of Rhododendron Edgeworthi in bloom; but owing to its having been forced into that condition somewhat prematurely, in order to be in time for the meeting, the two large white blossoms which it had produced were not at all nicely expanded, and the delicious fragrance for which this species is so remarkable was only just perceptible in them. From the thick coating of brown fur in which this plant is enveloped it was thought that it might possibly prove hardy; but such has not been the case, for it was mentioned that it had been killed last winter in the Society's garden and elsewhere, while R. ciliatum and one or two others have survived. The same firm also sent a hybrid Rhododendron called Alstrœmerioides, for which a Certificate of Merit was awarded. It is remarkable for its showy heads of small rosy flowers, which are covered all over with little dark-coloured bars, like those on the blossoms of some Alstrœmeria. It is a continental kind, whose history is unknown; but, be its origin what it may, it must certainly be considered an acquisition. Messrs. Standish and Noble likewise furnished an Indigofera from the north of China, which, although said to be hardy, is not by any means so handsome as I. decora; and a white semi-double Chinese Azalea called Narcissiflora, which will doubtless become a favourite. Several small plants of the latter, each bearing a cluster of blossoms, were produced, to show how freely it blooms, even in a small state. Both this and the Indigofera were stated to have been introduced by Mr. Fortune.—Messrs. Lee contributed a collection of plants consisting of two well-grown specimens of Eriostemon, Pultenæa biloba, two Azaleas—one vittata, the other the pretty little purple A. amœna—several Epacrises, and a dish of kitchen Apples, called in Hampshire "Duran," and which

appeared to be a good keeper. A Banksian Medal was awarded for the plants.—Messrs. Lane furnished three charming Rhododendrons, in the shape of good sized trees of R. campanulatum, a variety of the same called General Napier, and a thick bush, profusely ornamented with compact heads of delicate white flowers, vividly bordered with pink. For these a Banksian Medal was awarded. — Messrs. Weeks and Co. sent a young plant in bad condition, more especially as regards colour, of Aphelandra lateritia, some account of which was given at p. 239 of last week's Number. —From Messrs. Henderson, of Pine-apple Place, came four pots of the hardy, yellow flowered, scentless Patagonian Violet called pyrolæfolia, an Oxylobium, and a well cultivated plant of Maranta sanguinea, the beauty of which consists in the red floral leaves which cover the flowers, and not in the flowers themselves, which are small polished bodies entirely hid from view. A Certificate of Merit was awarded for the Violets.—Messrs. Lucombe & Pince received a similar award for Calceolaria Ajax, a dwarf, shrubby, bedding kind, remarkable for its great trusses of brown and yellow blossoms, which require no sticks to support them, owing to its sturdy habit. It was stated to be from Sultan, crossed with some high-coloured shrubby variety. It is not quite new, a promising plant of it having been exhibited to the Society last year.—Mr. Keeble, gr. to H. Davies, Esq., received a Certificate of Merit for a very finely flowered Tropæolum tricolorum, covering most completely a circular wire trellis some 4 feet in diameter.—From Mr. Gaines came Rhododendron aureum, R. dilectum, and the strikingly high-coloured Azalea named Holfordiana, for which a Certificate of Merit was awarded.—Mr. Dunsford, of Chingford, Essex, received a similar award for a specimen of Epidendrum Stamfordianum. — Messrs. Jackson, of Kingston, sent the little Brazilian Leptotes serrulata, Chysis bractescens, Barkeria elegans, six small plants of Lycaste Skinneri, all in flower, Dendrobium pulchellum, and Vriesia speciosa, the latter bearing two long feather-like spikes of scarlet inflorescence, which, in addition to brilliancy of colour, remains a very long time in perfection. A Certificate of Merit was awarded for this and the Dendrobe.—Mr. Dobson, of Woodlands Nursery, Isleworth, contributed eight Cinerarias, well flowered and skilfully cultivated, for which a Certificate of Merit was awarded ; and four pots of a double-flowered variegated Polyanthus.—Messrs. Henderson, of the Wellington Road Nursery, St. John's Wood, sent a Gesneraceous-looking plant of no beauty, called Sciadocalyx Warszewiczi, and along with it a note intimating that they had also forwarded some Cyclamens (one of the subjects for which special awards were offered on this occasion), but through some unexplained cause the latter never arrived. — The other subjects specially invited by the Society for this meeting were Cauliflowers and Cherries ; of the former none made their appearance, while of the latter there was only one dish, which was furnished by Mr. Fleming, gr. to the Duke of Sutherland at Trentham, and consisted of May Duke, large, plump, and well coloured. A Banksian Medal was deservedly awarded them. — Some Keens' Seedling Strawberries came from J. Allnutt, Esq., of Clapham; and Mr. Bennett, gr. to J. Smith, Esq., of Dulwich, received a Certificate of Merit for a dish of finely grown British Queen Strawberries ; which, although rather pale in colour, were, to all appearance, quite ripe.—Mr. Spary, of Brighton, exhibited six well-coloured bunches of Black Hamburgh Grapes, for which a Certificate of Merit was awarded. Mr. John Edwards produced three punnets of Potatoes, the first containing Lapstone Kidney ; the second the Fluke, a Lancashire sort, said never to have been attacked by disease ; and the third a seedling from the Fluke.—From the garden of the Society came Indigofera decora, the large-flowered Azalea calycina; Epacris grandiflora, the broad-leaved Daviesia; two Boronias, two Chorozemas, a well grown plant of Bauera rubioides, and beautiful clusters of cut flowers of the white Glycine sinensis, and also of the ordinary form of that plant, both of which were found by Mr. Fortune in the woods of Chusan, the only place where it has yet been seen wild. Along with these came fruits of Citrus japonica, or Cum Quat (a favourite Chinese preserve), from a plant which has just begun to bear in the garden. The fruit is small, oblong, and orange-coloured. It is preserved in sugar by the Chinese. The rind of the fruit is extremely fragrant. The garden also supplied some Neapolitan Cabbage Lettuces, a portion of which had been grown under Mr. Pilkington's bell glasses, which differ from the French cloche in having a ventilator at the top, in the shape of a neck or chimney, which can be left open or kept close as may be desired, by covering it over or not with another small bell glass, made for the purpose. In this way damp from the soil, which is often so destructive to winter Lettuces, can be let off without tilting up the side or moving the bell glass in any way, as has to be done in the case of cloches whenever air is given. The result of this trial has been very satisfactory—for, of a ridge of Lettuces planted out last October, those which had bell glasses put over them on the 27th of last month have attained nearly double the size of such as were left unprotected ; but which, in all other respects, were treated precisely like them. It was mentioned, however, that bell glasses can, unfortunately, only be had in the neighbourhood of places where they are made ; for, owing to the difficulty of packing them in small compass, the packing and carriage cost more than the original value of the glasses themselves.

Notices of Books.

Hooker's Icones Plantarum, Vol. X. Part I. (Pamplin).—This is wholly occupied by figures of Ferns, executed with very great skill by Mr. Fitch. It is understood that the succeeding part will also contain Ferns exclusively. Many of the species are now published for the first time. Collectors of living Ferns should send such books to their correspondents as guides to the kind of species which it is desirable to procure for ornamental purposes.

The Entomologist's Companion. By H. T. Stainton. (Van Voorst), 2d edition.—The title of this little volume is calculated to deceive the purchaser : it should have been called Microlepidopterist's Companion, for it relates to nothing whatever except the tiny moths. Collectors of such insects will find it of value ; to others it is useless.

Neill's Fruit, Flower, and Kitchen Garden (Black) has reached a fifth edition, under the care of Mr. Ravenscroft, of the Museum of the Highland Society. The favour with which the little work has been received is richly deserved, for it is no doubt a most useful practical guide to the management of common gardens; we may even say that when one volume only forms a gardener's library, this is the best he can select.

The *fourth part of* Dr. Seemann's *Botany of H.M.S. Herald* is before us. The plates are admirable, as usual, and the letter-press, which relates to the Isthmus of Panama, contains some interesting facts in addition to its systematical value. For example, we are told that the wood of some Melastomads is sometimes used for building purposes, and that the leaves of Conostegia speciosa are employed for washing dishes. The Apple and Pear-shaped Guavas are reduced, after Raddi, to one species. Turnerads are united to Passion-flowers, through the intervention of a new genus called Erblichia, described as a good-sized tree, attaining a height of 30ft. and more. The Compositæ are from the pen of Mr. Steetz, who we regret to see cannot divest himself of the bad German habit of attaching to every supposed novelty a long Latin description, four-fifths of which are superfluous. It as onishes us that men of such real talent as the German botanists should be unable to perceive the immense distinction between prolixity and precision.

Untersuchungen über den Bau und die Entwickelung der Baumrinde. Von Dr. J. Hanstein. 8vo ; pp. vi. and 108; tab. 8. Berlin. 1853.

We can give little more than the title of this work, which gives a luminous account of the structure of bark in general, accompanied by some excellent figures ; a subject of the greater importance, as it is generally neglected more than other points of structure by analytical botanists. We can answer for the correctness of the illustrations, as we have had occasion to compare minutely the structure of Vine bark, both in shoots of the first and second year, and were delighted to find the most complete concordance between the figures, and what we ourselves observed under the microscope. The advantage of having such matters collected in a separate treatise is obvious, as it not only facilitates research, but the attention having been especially directed to one particular portion of the tree, the information is at once more complete and copious. The work is part of the same series as that of Schacht on the structure and functions of cells, of the same author, on flax and cotton, and of Bary on Cryptogamic fungi. All are so good, that we anxiously expect other valuable contributions from the same publisher.

Mr. Murray has published a 2d series of those admirable *Essays from the Times*, which have so much contributed to maintain the high character of the greatest of newspapers. Fourteen subjects are treated of in the present volume, among which the life of Lord Coke, Lord Clarendon and his friends, Affghanistan, and the Greek Revolution, may be more particularly mentioned.

The new part (the 2d) of Messrs. Longman's People's Edition of *Macaulay's Critical and Historical Essays* is another of those excellent cheap issues which will render our low-priced literature the best in the world.

New Plants.

58. Abies Kæmpferi. *Lindley in Penny Cyclopædia, vol.* 1. Pinus Kæmpferi *Lambert, Monograph of genus Pinus, 2d volume. Preface.*

Seosi, vulgo Kara maatz Nomi. Larix conifera, nucleis pyramidatis, foliis deciduis. *Kæmpfer. Amæn. Exot. p.* 883.

A. foliis fasciculatis deciduis, cicatricibus pentagonis dorso rotundatis, strobilis oblongis cynaroideis fragillimis, squamis cordatis obtusè acuminatis (pyramidatis) patentibus deciduis, bracteis minimis serrulatis, seminum alis squamæ æqualibus ovato-lanceolatis dimidiatis.

Among the many curious things mentioned in that storehouse of learning, in which, under the name of "Amænitates Exoticæ," Kæmpfer collected everything that he saw, from the cuneiform inscriptions of Persepolis to the trees and flowers of Japan, mention is made of a Japanese Larch called Seosi, bearing what are called "nuclei pyramidati," by which was probably meant pyramidal scales to its cones. No traveller has seen the tree since the days of Kæmpfer himself. Siebold takes no notice of it in his account of Japanese Conifers, although he says that a kind of Larch, his *Abies leptolepis*, is sometimes called Karamats in Japan ; that is to say, "the Fir tree from Kara, or north-eastern Asia." But that plant has no apparent relation to the few words of Kæmpfer. Lambert, who had seen some drawing by a Japanese artist, founded upon the *Seosi* the name of *Pinus Kæmpferi*, necessarily altered in the "Penny Cyclopædia" to *Abies Kæmpferi ;* and there research was arrested ; for the name appears nowhere since that time. Mr. Fortune, however, in a letter dated Hong-Kong, Feb. 10, 1854, announced the discovery by himself of "a Larch found in the Central, Northern, and Eastern provinces of China ; a very beautiful tree, and no doubt perfectly hardy. The cones when young are very pretty, but exceedingly brittle." From specimens which have since reached us, and from seeds transmitted to Mr. Glendinning, of Turnham Green, we have been able to ascertain that the plant is altogether unlike any coniferous plant previously discovered. The branches are exactly those of a common Larch. The leaves are very slender, clustered, deciduous, from 1½ to 2 inches long, and leave behind them a pentagonal scar, the back angle of which is rounded off. The cones are pendulous, about 3 inches long, and 2½ inches in diameter, with excessively deciduous scales, diverging like those of an Artichoke head, to which, on a small scale, the whole cone bears no little resemblance. Each scale is woody, flat, cordate, narrowed gradually to an obtuse point, and on an average rather more than an inch long ; at its base is a minute acute serrulated bract. The seeds are exactly the size of the scales, two of them occupying the whole inner face with their wings—rectilinear where they touch, and curved to correspond with the curvature of the scales on the external edge. The least touch suffices to break up the cones, when the scales fall asunder, adhering very loosely in a bunch by long woody threads, one of which passes out of the base of each scale into the axis of the strobilus.

Mr. Fortune, like Kæmpfer, calls this a Larch. And so it is, if deciduous leaves can make it so. But one of the essential characters of a Larch is to have cones with persistent scales, while in this plant they are so deciduous that it is scarcely possible to make them hold together. In the latter circumstance the plant agrees with the Cedars ; but its leaves are not evergreen ; and moreover the peculiar Artichoke-headed appearance of the cones corresponds with nothing yet known among Cedars or any other form of Abies. We are, therefore, unable to say whether it should be regarded as more a Larch than a Cedar, or more a Cedar than a Larch. This, however, is certain, that the plant is one of the most interesting which the Eastern Asiatic Flora has yet produced.

FLORICULTURE.

Fuchsias.—These are now generally grown on what may be termed the one-year system of cultivation, for the plants are mostly only of one year's growth from the cutting state ; or sometimes old stems of the height of 5 or 6 feet are made into plants furnished at regular distances with laterals, upon the ends of which there is often only one bunch of flowers. Now, take a plant of this description, and compare it with one the same height in the shape of a compact pyramid, covered with finely formed and well coloured flowers, and it will at once be apparent which is the most creditable specimen. Pyramids, however, take three and often four years to come to perfection, as I will presently show ; but before I do so, permit me just to describe the sort of place best adapted for growing them in, which is a low span-roofed house or pit well ventilated, and having a south aspect. This house should contain a well made pit, which may be filled up with broken brickbats to within 9 inches of the top, where there should be 6 inches of rough coal-ashes, and then 3 inches of fine ashes on the top for the plants to stand upon, and which will keep them dry and clean. It will be found necessary to have the pit of three different heights, so that the plants may always be near the glass. The path may either pass round the house or through its centre, as may be most convenient. It is not every one, however, who has got a house or pit like the one just described ; those who have not such convenience, must therefore be content with what they have, but care must be taken that it is a house which can be well ventilated, and capable of receiving at all times the full benefit of the sun. In beginning to form pyramidal plants, take cuttings in March, and strike them in the propagating-house or some other suitable place. As soon as they are struck, pot them off into 3-inch pots, using a mixture of maiden loam, leaf-soil, and sand. Put them into a frame, but do not plunge them. Keep the frame moist, and maintain a temperature in it of from 55° to 60°, giving a little air on fine days. As soon as they begin to grow, and have got well rooted, increase the amount of air given them. In a very short time the pots will have begun to get well filled with roots, when the plants should be shifted into 6-inch pots, using a compost of maiden loam of rather strong texture, about one-third leaf-soil and well rotted dung, and a sprinkling of sand. The plants will now require the support of a small stick, but be careful not to tie tightly. They may now be taken out of the frame, and put into the house or pit in which they are intended to be grown. Place them near the glass, and give plenty of air on all favourable occasions ; syringing them slightly in the morning, and damping the paths frequently during the day, to keep up a moist atmosphere, which the plants enjoy, and in which they will grow vigorously. Here they will soon begin to

push laterals, which must be stopped when they have reached 2 or 3 inches in length; for it is by stopping the laterals that a compact pyramid is obtained. They must, therefore, never be allowed to run, or it will be useless to attempt to obtain a pyramidal plant; stop them all as they come out within 2 or 3 inches of the stem. Be careful not to let the plants get pot bound; and, therefore, as soon as the pots begin to get well filled with roots, let the plants have their final shift for the season, which should be into 10-inch pots, using soil as before, but not in a fine state. See that the pots are well drained, which is of great importance. This time, instead of putting a layer of moss over the drainage, as is often done, use fibrous turf, such as is left after the soil has been sifted out of it. The plants should now have a good stake put to them. Give them a slight syringing morning and evening, also all the air possible on fine days, and a little may now be left on at nights. All the laterals that were stopped before, should now be stopped again, as they require it. After they have been stopped twice, they may then be allowed to run, but do not let them bloom too much, for it will rob the plant of its support, and bloom is of no importance until you have obtained a fine specimen. The plants will now be growing vigorously; see therefore that they have a liberal supply of water, and abundance of air, and a little more air may now be left on at nights. It is by giving plenty of air, and using soil of rather a strong texture, that you obtain short jointed and well ripened wood, which is what is required in order to have Fuchsias in perfection. As the wood ripens so withhold water, and when it is quite ripe they may be kept dry, and the house or pit cold. Keep them in this condition until the beginning of February, then let them be pruned in to one or two eyes from where they were last stopped, when a foundation will have been laid for a pyramidal plant. Give them a good soaking with water, when they will soon begin to break. As soon as they are well broken, let them be turned out of the pots, the old soil shaken from them, and the roots pruned in a little. Then pot them in small pots, using soil as before. Keep the house rather close for a few days, giving a slight syringing in the morning. Continue the same treatment as recommended above throughout the second and third years, and by that time you will have got a well formed specimen plant, worthy of a place in any exhibition or conservatory. The following year they may be allowed to bloom, therefore the laterals will not require to be stopped. Let the soil used for potting be of a strong texture, and give abundance of air on all favourable occasions, whereby you will get short-jointed wood and fine bloom. *E. A.*

Miscellaneous.

Enhanced Value of English Timber.—At a recent wood sale in the plantations of Mr. Barrow, of Sydnope (says a Derbyshire paper), the number of purchasers was greater than at any similar sale for years past, and Mr. Poyser, the auctioneer, knocked down 126 lots, chiefly Larch and Scotch poles, to eager buyers, in about three hours, at prices which in the aggregate realised fully 40 per cent. above the sum at which the timber had been valued by competent judges. A correspondent states that 5*d.* per foot has been refused for Scotch poles, containing 2 feet or over, while a few years ago, the same descriptions of wood might have been obtained at from one penny to three halfpence. The advanced price of foreign timber, no doubt, throws more English into use, rendering it more in request. *Builder.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Any attention which will serve to prolong the beauty of the Azaleas and New Holland plants, &c., with which the show house should now be gay, will be well bestowed, as when these are over it will, in most cases, be impossible to furnish the house with equally handsome specimens, and the same variety of colours, &c., which these afford. Get shading into use without loss of time. Also carefully examine the plants on the forenoons of bright days, and see that none of them are suffering for want of water; for with bright sunshine, accompanied with drying winds, it will be no easy matter to properly supply plants with water, particularly specimens that may be rather pot-bound. In ventilating, endeavour, while parching winds prevail, to avoid allowing currents to blow through the house, especially near recently potted specimens, or plants recently brought from stoves. Take care of the young leaves of Camellias, and apply shading the moment it is perceived to be necessary. Continue to repot, and place the plants in a moist growing temperature, as they have done blooming. Use the syringe liberally on those in free growth, and assist them with plenty of clear weak manure water; and Azaleas, if at all pot-bound, will be benefited by similar attention. Orange trees in middling health, which, owing to the neglect with which they are generally treated, is too commonly their case, will require attention, to prevent the young leaves being eaten up by red spider. The readiest and most effectual method of clearing them of this pest is to lay the plants on their side, and well wash the under parts of the leaves with the engine; but, unless the trees are kept in health, this will be but a partial cure. Afford them plenty of liquid manure, and a moist, somewhat shady situation, and see that the drainage is perfect; also repot where necessary, using a compost of two parts rather strong, rich, mellow turfy loam, and one part good strong fibry peat, nicely broken up, and well intermixed with clean sharp sand and bones broken small, and there will be no trouble from red spider. STOVES.—Many of the Orchids being now in active growth, will require careful shading, to protect the tender foliage from the direct rays of the sun, and also to keep down the temperature without admitting currents of air, which, during the present state of the weather, would render the atmosphere altogether unsuitable for them. Keep the atmosphere as moist as possible, by frequently sprinkling every available surface, and shut up early in the afternoon after syringing, giving the plants a good steaming. The specimens should be individually examined, frequently watering those that require it, and avoiding syringing heavily and promiscuously over-head, until the young growths become somewhat firm. Give every necessary attention to soft-wooded plants in free growth, keeping them near the glass, and regularly stopped, so as to secure close compact growths. Also attend to supplying them with plenty of pot room, and manure water. Give air freely on every favourable opportunity; but guard against drying currents.

FORCING DEPARTMENT.

PINERY.—In cases where the plants are near the glass, and growing in houses glazed with large sized squares, a slight shade will be almost indispensable. This, however, should be of a thin material, and used only a few hours in the middle of bright days. See that those planted out in the open bed are properly supplied with moisture at the root, and spare no trouble to afford the whole stock, excepting those ripening their fruit, a thoroughly moist atmosphere. Do not neglect staking fruit that require it, until the crowns get one-sided, and those colouring should be afforded as dry an atmosphere as circumstances will admit, giving no water at the root after they begin to colour. VINERIES.—The present weather will be very trying for weakly or overcropped Vines, and these will require to be carefully watched for red spider, which will be almost certain to make its appearance on weakly plants. This pest must be eradicated the moment it is perceived, for it is of little use trying to overcome it by means of the syringe, which only serves to keep it in check; and when the berries begin to colour, and syringing must be discontinued, it soon gains ground, and speedily destroys the foliage. It should be closely watched for in suspicious situations, carefully washing the affected leaves with a sponge the moment it is perceived, and this should be repeated as often as may be necessary, at the same time using every means to strengthen the plants by giving them plenty of manure water, &c. Be careful to maintain a moist atmosphere, giving air cautiously during weather like the present, and do not allow inside borders to become too dry. FIGS.—Where the fruit is approaching maturity the atmosphere must be kept drier, giving little or no water at the root from the time that the fruit begins to ripen until the crop is over. Plants in pots, however, will require a supply of water, but it should be very moderate while the fruit is ripening. Attend to stopping young shoots before the fourth or fifth leaf, and keeping them thin and regularly tied in; also guard against red spider by maintaining a moist atmosphere, &c. MELONS.—The present bright weather will be very favourable for plants setting their fruit; keep these rather dry, and avoid watering until a crop of fruit is fairly set, when the soil may be thoroughly soaked with tepid water, afterwards covering it with slates to prevent evaporation and assist in maintaining the soil in a uniformly moist state without the necessity of watering so frequently as would otherwise be necessary. Keep the shoots of young plants properly thinned and regulated, so as to secure strong fruitful wood.

FLOWER GARDEN AND SHRUBBERIES.

The long continuance of cold drying winds and bright sunshine will have been excessively trying to large-sized evergreens that have been recently transplanted, and the attention and expense in watering, &c., those will have required to carry them safely through, may probably convince many persons of the impropriety of removing large plants in winter or spring. At all events, those who have an opportunity of judging between September and winter or spring-transplanted shrubs and trees, will agree with us that early in autumn is the best season for effecting the removal of plants of any size. Nothing but the most careful attention will save those that have been recently transplanted; and besides keeping the roots regularly moist, watering the plants over-head with the garden engine towards evening will be necessary in the case of such as may appear to be suffering from the drying weather, and every plant should be examined daily and carefully, so that nothing may be allowed to suffer through neglect. Take advantage of the present favourable weather for the destruction of weeds, &c., to get shrubbery and herbaceous borders cleaned—indeed it will be advisable to run the Dutch hoe over these, if merely to lighten the surface. Bedding plants must not be rashly exposed for the present, as the weather we are experiencing would soon effectually dry the tissues of plants that have been growing in a moist, rather warm atmosphere. The season is, however, far advanced, and the process of hardening should be commenced as soon as the weather will admit; but for the present shade slightly during bright sunshine, and expose freely to air, such plants as are well established, carefully avoiding cold drying currents.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending April 20, 1854, as observed at the Horticultural Gardens.

April.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth 1 foot deep.	2 feet deep.	Wind.	Rain.
Friday 14	17	30.171	30.053	66	29	47.5	48	48½	E.	.00
Satur. 15	18	30.027	29.990	67	26	46.5	47½	49	N.E.	.01
Sunday 16	19	30.195	30.103	64	30	52.0	47½	49	N.E.	.00
Mon.. 17	20	30.234	30.206	59	32	45.5	49	50	E.	.00

Wed. 19	22	29.938	29.868	77	44	60.5	50	51	S.E.	.00
Thurs. 20	☾	29.750	29.566	75	51	63.0	51	52	E.	.02
Average.		30.068	29.971	67.8	37.6	52.7	48.8	49.9		.03

April 14—Frosty; slight haze; very fine; clear; frosty.
— 15—Cloudy and fine; very fine; clear at night.
— 16—Very clear and fine; overcast.
— 17—Light clouds; fine; clear at night.
— 18—Slight haze; fine; very clear.
— 19—Slight haze; very fine; cloudless; air excessively dry; clear.
— 20—Very fine; excessively dry air; overcast; rain.
Mean temperature of the week, 5½ deg. above the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending April 29, 1854.

April.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 23	58.8	38.7	48.8	15	0.52 in.	1	4	4	1	4	4	5	6
Mon. 24	58.2	36.0	47.1	11	0.60	4	2	5	4	1	2	7	3
Tues. 25	58.6	38.3	48.5	12	1.40	3	2	4	—	—	3	7	5
Wed. 26	59.3	36.2	47.8	13	0.12	3	6	4	1	1	5	9	2
Thurs. 27	59.7	36.2	48.0	13	0.12	9	1	4	2	5	5	2	2
Friday 28	61.1	37.2	49.2	12	0.32	1	4	6	4	4	6	2	2
Satur. 29	61.4	39.2	50.3	10	0.75	2	3	6	2	4	5	3	4

The highest temperature during the above period occurred on the 28th, 1840—therm. 81 deg.; and the lowest on the 25th, 1827, and the 26th, 1835 and 1853—therm. 25 deg.

Notices to Correspondents.

BAROMETERS; *J D.* As a weather indicator, a *good* aneroid is as useful as a common barometer.

CONIFERS: *A B.* It must surely have been owing to soil, not cold, that you have lost Cupressus funebris and Cryptomeria japonica. They most likely object to growing on chalk. Try Abies Pinsapo, Cupressus macrocarpa, Pinus excelsa (and Webbiana, if you are above the reach of spring frosts), Araucaria imbricata, and Deodar, together with Juniperus sinensis, and Abies amabilis, if on its own roots. Pinus insignis cannot be depended upon.

INSECTS: *W D S.* The "bug" you have sent is a water beetle (Acilius sulcatus); it is quite harmless to vegetation. The shell is generally found in situations near or in water; it is a very common species.—*T F.* The woolly insects found on old wood in Peach-houses are the common scale of the Vine, with myriads of young and eggs enveloped in the woolly matter. Eyes and hands must be used forthwith, or your trees will soon be in a woeful plight. Hot water or tar-water are good destructives. The beetles are the click beetle (Elater striatus). Destroy them, as they are the parents of the wire-worms.—*J C.* The small beetles which are destroying your early Peas are the Pea-weevil, Sitona lineata. Powdered unslaked lime sprinkled thickly over the rows is advantageous, especially when the plants have been previously wetted. Gas-tar water will also penetrate to their quarters, and drive them out if used liberally.—*H H.* The small red grubs in the Raspberry buds are those of a pretty little moth (Tinea rubiella), whose history was given in this journal last year (p. 757).—*Anon.* The fly-traps you inquire about can be procured from W. Downing, 171, Great Dover Street, Borough; Knight & Sons, Foster Lane, Cheapside; or of Bews, 19, Newgate Street, London. *W.*

NAMES OF PLANTS: We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*May.* Anagyris fœtida.—*H E.* Narcissus Bulbocodium.—*A Kentish Man.* Cyrtopodium Andersoni.—*Woodside.* Cerasus Mahaleb.

PEACH TREES: *P Q.* "Whether it is right to shorten the young shoots of Peach trees, at the winter pruning, when the trees are void of bearing wood except at the tops," admits of no doubt. If you do not shorten, you cannot have your trees furnished with bearing wood as they ought to be at their bases. Of this, your own trees are proofs; if you had shortened in time, they would not have been naked at the bottom. When bearing shoots are left at full length, you can rarely depend on getting a proper supply of well-placed succession shoots; they should be all shortened; and to this general rule the Noblesse and Royal George varieties form no exception. ‖

PELARGONIUM SEED: *J R.* Really we cannot become public prosecutors. You must seek the usual remedy. We know nothing about the matter.

POLYANTHUS: *C C.* The cause of such changes is unknown; the fact that they often occur is well known; the theory respecting them belongs to morphology, concerning which a great deal was published in our columns a few years since.

POMEGRANATE: *J H.* It will not flower unless the wood gets thoroughly well ripened, by being roasted in a hot autumn air. Your tree against a south wall is, however, possibly too luxuriant to ripen its wood perfectly.

POTATOES: *L S.* Earth them up well; that is all.—*S T.* It is difficult to get Chapman's Kidney now; but, earlier in the season, plenty of it may be had in Covent Garden market. ‡

SEED-STEEPING: *J D.* We have not the smallest belief in the process of steeping in manure water. The question has been very fully subjected, long ago, to the test of comparative experiment, and it was proved that, although steeping in water was useful, yet nothing whatever is gained by steeping it in manure water. Do you seriously believe that a child well nursed for two or three days, will, on that account, become a stronger man? And yet you must have faith in that, if you have faith in the other.

SPORTS: *J S.* Such cases are not uncommon. You find their parallel in double Anemones, double Bachelors' Buttons, and double Clematis florida.

THE CRYSTAL PALACE: *A Constant Reader.* We believe you to be wholly misinformed.

VINES: *R D Atkinson.* The small green excrescences on your leaves are not caused by the glass, but by too damp an atmosphere and unskilful ventilation. They are perfectly harmless. ‡

VINE DISTRICTS: *W T.* We know of no such map as that you inquire for. ‡

WINDOW GARDENS: *H T C.* If well managed, such a place as you describe may be gay and pretty, provided you keep the plants quite clean, *i. e.* free of soot and dust.

WOOD PAPER: *H Watt.* A great many thanks. We will attend to it next week.

MISC: *W T.* We cannot assist you, as we only supply the *trade* in sheets. Complain to your agent.—*T Underwood.* The address is perfectly correct. You had better inquire further into the matter.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.

The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturist's London Agent, 1a, Bishopsgate Street Within.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.

WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec. Bridge Street, Blackfriars.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL and Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

	£	s.	d.
Single Cylinder (as engraving) ...	8	8	0
Double Cylinder ...	10	10	0
Horse power size ...	15	15	0

Exclusive of Suction and Delivery Pipes.

Illustrated Catalogues free per post.

Terms Cash on Delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London, removed from Oxford Street.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader.

Is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9s. upwards. An extensive assortment kept.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

RICHMOND AND CHANDLER'S No. 1 CORN CRUSHER (Price 5l. 5s.) was first introduced a few years ago, as a decided improvement upon others theretofore made. Subsequent time and experience have served to render it more perfect, and to greatly extend the pre-eminent patronage of members of the Royal Agricultural Society, and distinguished scientific authorities throughout the world.—Address, RICHMOND & CHANDLER, Implement Works, Salford, Manchester; and 32, South John St., Liverpool. Export orders completed on the shortest notice.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and urserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

POULTRY SHOW AT EXETER,

OPEN TO ALL ENGLAND.

THE DEVON AND EXETER BOTANICAL AND HORTICULTURAL SOCIETY will hold a GRAND POULTRY SHOW, on Northernbay, Exeter, in conjunction with the Society's Spring Horticultural Exhibition, on THURSDAY and FRIDAY, the 18th and 19th days of May next. Prize Lists and Regulations may be obtained on application to the Honorary Secretary, THOMAS WILLIAM GRAY, Esq., Cathedral Yard, Exeter.

WEST KENT SECOND ANNUAL POULTRY AND FLOWER EXHIBITION, Under most distinguished Patronage, will take place on TUESDAY and WEDNESDAY, the 20th and 21st of June next, in the Market Field, Farningham.

Prizes will be awarded for Poultry, Pigeons, and Rabbits. Stove, Greenhouse, and Herbaceous Plants, Fruits, Vegetables, Roots, and Cut Flowers. Applications for Forms of Certificates of Entry, Prize Lists, and Regulations for Poultry, &c., to be made to the Secretary, and for Flowers, &c., to Mr ALFRED LOCKYER, Secretary, Farningham. By Order of the Committee of Management,

BAPTISTE THOMAS, Secretary.

Committee Room, Lion Inn, Farningham, Kent.

GRAND POULTRY SHOW AT BATH, JUNE 7th, 8th, and 9th. In connection with the Bath and West of England Agricultural Society, but with a separate entrance and subscription.

Director and Steward—JONATHAN GRAY, Esq.

The Honorary Secretary will forward Prize Lists and Certificates of Entry on application.

All Certificates must be returned to him on or before the 10th of May, or Exhibitors will be excluded.

All Advertisements for the Catalogue must be forwarded to him by the 10th of May.

By the kind liberality of the Great Western, the Bristol and Exeter, and South Devon Railway Companies, all Poultry will be taken to and fro free of carriage, provided the same are not sold.

HENRY SPACKMAN, Honorary Secretary, 6, Terrace Walk, Bath.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

The Agricultural Gazette.

SATURDAY, APRIL 22, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, April 27—Agricultural Imp. Society of Ireland.
MONDAY, May 1—Central Farmers' Club.
WEDNESDAY, — 3—Agricultural Society of England.
THURSDAY, — 4—Agricultural Imp. Society of Ireland.

ON the first publication of the *Agricultural Gazette*, now more than ten years ago, a large mass of MSS., containing the records of an immense number of experiments in the application of manures, was placed at our disposal by a gentleman who has since become the first living authority on such subjects. They appeared to us, in comparison with the individual facts and lessons which a weekly periodical is best fitted to convey, pretty much as the memory of a whole lifetime of agricultural experience must appear, when compared with the picture which at any one moment may occupy the eye in the field. An immense amount of labour had been spent in the determinations which they recorded, but an equal amount was necessary before they could be read, compared, and classified so as to present the general truths on which they rested, and to which they were due. The publication of so voluminous a series, valuable as it was, seemed more proper for a larger and less frequent periodical than our own, and they have accordingly since been published elsewhere.

During the ten years which have elapsed since that time, the facts then determined in reference to that one department of farm practice have become a fraction only, and a very small one, of the immense amount of information which agriculture in all its aspects owes to the same indefatigable observer. The food of animals, as well as that of plants—the processes and results of animal as well as of vegetable growth, have been largely illustrated. Never previously has agricultural truth been accurately read upon so large a scale; till very recently either the questions put to Nature on its behalf have been confined within the limits of a retort or a bushel as to contents, a few stones or cwts. as to weight, a few perches as to extent, and at the most a single season as to time; or no definite question at all has been framed, and the observer has been content to read, as best he might, the large and general aspects, which, unquestioned, she is continually presenting. It is one of the most striking evidences of the agricultural energy of these more recent times, that a research, which for its cost of time and of means — for the scale on which its several departments have been conducted, and the many years during which it has been perseveringly pursued — might well have been supposed the proper work of a great society or Government commission, should have been conducted unassisted, and even unsuggested, by a private English gentleman. Perceiving the great national value of a clearer insight into the true theory of agriculture—recognising, also, with great skill, those lines of inquiry by which it may be most successfully unravelled—securing to himself, in the person of Dr. GILBERT, of St. Albans, the assistance, and, no doubt also, to a great extent, the guidance of first-rate scientific ability—Mr. LAWES, of Rothamsted, has done more than any previous observer towards the attainment of the great object he has had in view.

An immense mass of facts has been collected—whether they have throughout been *read* perfectly, so as to exhibit all the truth they convey, we do not now stop to inquire—that they have been observed and recorded correctly is the most important point, and one which lays us under greatest obligations to himself.

The results are given in the important papers with which he has enriched the volumes of the English Agricultural Society's Journal, and their value is proved by the first-class position which they hold in every discourse on agricultural progress; such, for instance, as the very able lecture by Dr. ANDERSON before the Highland Society the other day.

Attention has recently been directed, by an advertisement in our columns (p. 227), to the services which Mr. LAWES has rendered to British agriculture. The movement there referred to has originated, as most properly it ought, in the neighbourhood of his labours, where their extent and cost and his own liberality can best be estimated; but it has since extended, as still more properly it ought, all over the country which has benefited by them. How cordially we approve of this movement may be judged by the remarks just made. We shall be heartily glad if this notice of it should tend to the fuller attainment of its object.

SOME weeks ago we referred to a discussion on the best kind of Turnips, and on the best means of obtaining good seed, which was conducted before the Highland Society of Scotland. Since then a very interesting statement on the subject has been made by the Marquis of TWEEDDALE, at a recent meeting of the United East Lothian Agricultural Society. This society, in accordance with a suggestion made by his lordship, has offered a prize of 20l. for the best essay on the question—"Whether a more correct principle than specific gravity can be discovered in selecting Turnip roots as the origin of seed for improving the stock?" We shall extract one or two passages from the address given by his lordship on the occasion of this meeting, but must condense his critique of the existing rules which have guided the decision of judges on this point hitherto. These relate almost exclusively to the particulars of form and weight; the one as determining in a great measure the ability of the root to withstand the weather, and the other as determining the acreable produce yielded. The note, accompanying an offer of premium for roots, stated—"Weight to be the principal criterion, provided the judges are satisfied of the quality, shape, and purity of the roots exhibited:" and it was contended by the speaker that, where practical experience in the use of roots for feeding is so general, and when the chemist is at our call to inform us of the constituent parts of any substance he may submit to analysis, so vague a mode of estimating superiority must give way to a more enlightened mode of deciding the merits of competing roots.

A series of experiments has been proceeding at Yester, with the improvement of the Turnip root as their object; and the whole has been planned on the principle that density is the true index of its value as food for cattle, and that by selecting

roots of the greatest specific gravity for seed, we transmit their hereditary quality of density nearly in the same ratio. The following is an extract on this point from the address we have referred to :—

"To illustrate the correctness of this principle, it will be suitable to divide the constituent parts of a Turnip into those heavier and those lighter than water—the former are woody fibre, albuminous compounds, sugar, gum, and other allied principles, phosphates, and other salts ; the latter consist of oil and air. With the exception of oil, all the useful compounds of the root are denser than water, and the proportion of oil present in Turnips is greatly too small to go for much in counterbalancing the greater density of their other compounds. In those Turnips, accordingly, which are lighter than water, the low density must mainly be attributed to the amount of air present, which renders the whole buoyant. In regard to the oil, the proportion is small even in the Turnips richest in it, and its density, probably like other vegetable oils, about ·950 ; and as almost all sorts of Turnips, except Swedes, show a density of not more than from .800 to .900, it is manifest they cannot owe their small specific gravity to an ingredient excelling them in density. Air, therefore, and not oil, is, no doubt, the chief cause of their low density. Great lightness in a root, therefore, must be taken as implying that it contains much air, and correspondingly little nutritious matter ; and, after setting down a very small per centage of the lightness to oil which is useful, the conclusion may safely be drawn that, bulk for bulk, there is a greater weight of nutritious matter in the heavier of two Turnips, both of which are lighter than water. A similar conclusion must be extended to Swedes, which generally are denser than water ; for, doubtless, their specific gravity always appears smaller than that which the solid matters in them would show if all air were separated from them ; for, although we have not ascertained precisely the feeding or fattening properties of each of the constituents, yet we learn from the density the amount of solid nutritious matter, excluding oil, which equal bulks of Turnips contain, and if we deduct the influence of the air contained in them in diminishing their specific gravity, then we may, without hesitation, conclude that the heavier a Turnip is, the larger will be the amount of nutritious matter contained in it. In regard to seed produced from roots of a given density, there is good evidence to show that the qualities of the parent will be certainly transmitted to its offspring, and exert an influence on succeeding generations. It has been ascertained in France that the per centage of sugar in the Beet-root has been nearly doubled by selecting, for a series of years, roots of the greatest density for seed as the origin of improvement. It may, therefore, be inferred by analogy, that similar treatment of the Turnip-root will be attended with a like increase of its nutritive properties. I have sent the seed grown on the principle described to Mr. Lawson, who has distributed it in portions to be sown on various soils in different parts of Great Britain, where he can depend on proper attention being paid to the seed not being adulterated by a mixture of other seed grown in the neighbourhood. The ticket I send to Mr. Lawson with the seed, guarantees that it is sprung from Turnips of the species enumerated, selected with the greatest care and nicety from many thousand Turnips, the specific gravity of which has been tested by weighing small pieces selected from three different parts of a Turnip in scales and water, and which has been afterwards planted for seed. I have received double the price at which Mr. Lawson sells seed of the same species of Turnip, which amply remunerates me for the expense and my trouble. I hope soon to be able to supply Mr. Lawson with seed produced by Turnips selected by a still more improved mode, though on the same principle, at the same time backed by the practical authorities to which I have previously alluded, and with the addition of the constituents parts of the Turnip-roots tested by the ablest chemists, and noted on the ticket. Any gentleman who may wish to see the process, and to satisfy himself of the correctness with which this system is carried out, will have an opportunity of doing so by paying a visit to the scene of our operations at Yester."

The Marquis of TWEEDDALE referred, in the course of his address, to the services rendered by Mr. LAWSON in the course of this research, and to the difficulties which farmers who grow their own seed have to overcome, as compared with the position of those who deal with trustworthy seedsmen.

As to the immediate object of his address—the hereditary transmission of density in the bulb of the Turnip is a matter certainly of very considerable agricultural importance ; but, as it is a question relating to simple fact, which will no doubt soon be satisfactorily answered, it is of little use to attempt any anticipations. That density indicates qualitative value seems pretty satisfactorily made out ; and, if by continued care in the selection of roots on this principle, the quality of our cattle-food shall be permanently improved, farmers will be greatly indebted to the Marquis of TWEEDDALE for the perseverance which he has exhibited in directing his own efforts and the attention of others to this subject.

THE increasing demand which our colonies are making upon our rural districts for labourers calls for remark. Instead of England having to complain of Irish "beggars," or the kingdom generally of Unions being filled with able-bodied paupers—many a parish may be found, ere long, having good cause to regret, when too late, its want of cottages for the settlement of labourers to cultivate its own soil and harvest its produce.

Take an instance in illustration :—A certain parish was, as it still is, supplied with labourers from the adjoining parishes, from Ireland and Scotland, to perform its work. From the redundancy of this supply it has neglected making provision for an increase of population to meet an increase of labour. It had even pulled down many a cottage, and, in some cases, farm-houses also—arable lands being sown down to permanent pasture and meadow—so as to diminish the heavy burden of tithe and poor rates at a time when the price of produce, and the amount of rent, as well as of tenants' profits, were on the decrease. At this time the reaping of corn, and, sometimes, part of the labours of hay-making also, were performed principally by hands from the sister country. Root crops were little grown in many of our southern provinces, so that the work of hoeing was proportionally insignificant. If a farmer wanted some 20 to 30 Irishmen to cut down his Wheat, he had only to write to some previously appointed party that he and his fellow reapers could have so many acres of Wheat, Barley, and Oats at the terms of last year, the work to be concluded within a given time, and that general employment could be had during the harvest by working northwards, when return of post brought him an answer invariably couched in the most grateful terms, that the chosen hands were on their way to England. Many of these poor people were small occupants of land—indeed the vast majority of them were so—or the sons of such, with barely half employment at home ; their holdings yielding hardly a sufficiency of Potatoes, &c., to hold them in life, leaving nothing for rent, stipends, &c., so that little difficulty was experienced in arranging as to the temporal and spiritual management of their affairs and families during their absence, by promising to account for every sixpence earned during harvest. And how religiously such promises were fulfilled, they begging their way backwards and forwards under hardships and privations, our readers need not now be told.

So long as things remained in this state, all went well with the parish at issue ; but old times are fast passing away, and the new ones exhibit a rapidly decreasing supply of labourers to perform an increasing amount of work. Land drainage, improved implements, manures, &c., are now enabling farmers to grow Turnips on soils which would not produce them otherwise, requiring thus an increase of hands to hoe them. Many of the lands, again, laid down to Grass some 20 to 50 years ago must now be broken up, thereby increasing the breadth of the harvest fields, while Ireland no longer responds to the old demand for reapers. The last census proves that between 1841 and 1851 upwards of two millions of the labouring population of Ireland, exclusive of the decennial increase, which would have been at least one million more, had left their native land never to return again, in spite of all the tenacity with which they had previously clung to their small holdings and wretchedness ; and although the parent stock has thus been reduced, and is annually becoming less and less, yet the tide of emigration continues to roll on with undiminished volume, while English and Scotch agriculturists (landlords, tenants, and labourers) are fast filling up the dreary void thus created. Under such circumstances there is but one conclusion at which to arrive—that English parishes can no longer rely with safety on them for reapers in harvest.

Nor is the spirit of emigration confined to our Celtic population, for, on inquiry at home, it will be found that the hearts of many of our most industrious and enterprising labourers are either bent for the gold diggings or the independence and prosperity of colonial agriculture. And who does not approve of their conduct ? Their change into independent colonial farmers is a work of the highest order, demanding not merely approbation, but encouragement and assistance ; but whether we approve, encourage, and assist, or not, *one thing is plain*, that the pinching privations which they themselves are this year experiencing, in consequence of the high price of food, aggravated by the prospects of an expensive and protracted war, are teaching them a lesson they will not soon forget ; and it may now be too late to talk of amended laws of settlement, or anything else, to avert the calamity now threatening parishes like the one under consideration.

The crisis to which we are fast approaching is simply this—a want of labourers on every farm, estate, parish, or union in the kingdom, alike English, Irish, and Scotch, which does not contain within itself a sufficient number to perform its own work at all seasons of the year ; and the only remedy seems to be that of building cottages and furnishing gardens where required, so "settling" in every parish or Union where labourers had been removed, the requisite number to perform its work.

TRADE MUSEUM.

[THE following circular is being very widely circulated. The Society of Arts have called the attention of the Institutions throughout the country in union with itself, to it; and the Central Farmers' Club would do well to do the same towards all farmers' clubs throughout the country. The subject is one in which farmers certainly, as well as other manufacturers, are interested ; and we shall be glad if any of our readers should feel personal interest in the matter sufficient to induce their correspondence with Mr. Solly on the subject, with a view to any assistance they may be able to render him.]

"Sir,—Her Majesty's Commissioners for the Great Exhibition of 1851 having, conjointly with the Society of Arts, appointed me to commence the formation of a general collection of the raw produce and manufactures of all countries, as set forth in the second report of the royal commission, I am now occupied in forming a collection of raw and manufactured animal produce of every description ; and I am, therefore, desirous of inviting the aid and co-operation of all who are interested in the pursuits of trade, commerce, and manufactures.

"The collection, with the formation of which I am thus charged, will contain samples of the produce of Great Britain and Ireland, the British colonies, and also of all foreign countries. It will hereafter be arranged and exhibited in the most convenient and instructive manner; and, when complete, will represent the productive resources of each country, accompanied by such statistical and scientific information as may be desirable.

"The object of the present circular is to invite producers, merchants, manufacturers, and others, who are disposed to aid, by contributing samples of raw or manufactured animal produce to the Trade Museum, to communicate with me on the subject. The specimens should in all cases, if possible, be accompanied by written descriptions, stating where from, by whom produced, collected, or manufactured, the cost of production, collection, or manufacture ; and should be forwarded to me at the society's house. It is hardly possible to specify exactly the best size for each sample ; the collection is formed for practical use, and therefore each specimen should be large enough to show the distinguishing characters or properties of each article in a clear and satisfactory manner. Specimens of all kinds of animal produce will be valuable, whether at present used in the arts or not. Samples of the same articles, showing peculiarities of manufacture, nature, or preparation, or derived from different sources or localities, will also be received, as it is an essential feature in the collection now forming that the productions of different countries or localities shall be contrasted and shown side by side.

"Yours, &c., EDWARD SOLLY."

The following list is by no means complete, and might be very considerably extended ; it is merely given as an indication of the class of articles which are desired. We extract only a few of the classes named, in which farmers may be considered interested :—

Animal charcoal	Horse tails	Ox tallow
Blood (dried)	Horse hair	Peacocks' feathers
Bones	Horse oil	Pheasants' feathers
Butter (preserved)	Horse skins	Quills of all kinds.
Calf skins	Horns of all kinds	Rabbit skins
Cow hair	Hoofs of all kinds	Saddlery
Coprolites (fossil)	Hogs' lard	Sheep skins
Cod-liver oil	Hogs' skin	Sheep's tallow
Cow hides	[Insect pests ?]	Sheep's tail oil
Eggs of all kinds	Lamb skins	Skins of all kinds
Guano	Leather of all kinds	Sugar of milk
Harness	Llama wool	Tallow of all kinds
Hides of all sorts	Milk (preserved)	Teeth
	Ox hides	Wool of all kinds

THE MANAGEMENT OF FORWARD EWES AND LAMBS.

(*Continued from p.* 242.)

THE best Grass upon the farm having been reserved, both in Wheat stubbles and the young Clovers, the ewes with their lambs should now be placed on this food, taking care to feed the Clovers at the day-time, and the Wheat eddishes during the night, as the former would receive damage by the stock feeding during the night frosts ; and the latter furnishes the best lair and shelter for the young lambs.

In this manner, if the Italian Rye-grass has been provided for them, as before directed, the ewes will give the greatest quantity of milk, and they may be kept upon these Grasses until the lamb is a month or five weeks old with immense advantage ; for the lambs will be found at the end of that time in the best possible condition. At a month old the ram lambs should be castrated. There are two methods pursued ; one called drawing, which is done whilst the lamb is from a week to 10 days old ; the other called cutting and searing, which may be effected with advantage after the lamb is a month old. I prefer the latter plan, as it is much safer ; and the lambs, when arrived at maturity, will be found much more fleshy ; and (the prime parts of the animal being more perfect) they will be better appreciated by the purveyor. When the lambs have attained the above-named age, they, as well as the ewes, should be taken from the Grass and placed upon root-feeding. At this age the lamb begins to require food in addition to its mother's milk ; and for the benefit of the ewe it is desirable that the lamb should have it ; for although the lamb would go on and improve up to the age of eight or nine weeks old without artificial aid, yet the condition of the mother would be greatly reduced. And as it is

customary to fat the ewe and the lamb at the same time, I consider it necessary that they should both be advanced by the best known means from the time the lamb has attained the age of five weeks.

In order to do this, I recommend the following method (which is, indeed, my own practice) :—Previous to commencing the feeding of roots, whether they consist of common Turnips, Swedes, or Carrots, they should be stacked or heaped in readiness for consumption about a week or 10 days before being required for use. This will give time for the work to be kept forward should bad weather supervene, which may otherwise prevent the process of lifting the crop, and thus stop the system of feeding. The advantage of this mode of feeding depends very much upon the roots being cut and placed in troughs, both for the ewes and lambs, which has enabled parties occupying comparatively cold and heavy land to keep this early stock. Previous to the introduction of the cutter invented by Mr. Gardiner, the forward ewes and lambs were kept almost exclusively upon the driest soils, where the Turnips could be consumed upon the land without loss ; but it is now, however, rendered quite practicable, and, indeed, advantageous, to keep them upon nearly all soils where the climate is favourable, except cold clay soils, lying flat, and unable to get rid of the water. Indeed, it is now a well ascertained fact, that some of our heaviest clay loams, which feed badly in the winter months, produce roots of the best quality ; and with the plan of trough-feeding, these soils, under particular management, will produce the best stock, owing to the great feeding value of the roots grown upon them.

In commencing to feed ewes and lambs with roots, it is of the greatest importance that the lambs should feed in advance, and separate from the ewes. It is, therefore, necessary that what is called a lamb-gate should be provided, with space between the rounds, to allow the lambs to pass through freely, without being sufficiently wide to admit the ewes. In entering a field of roots, it is best to commence feeding the lowest part, for two reasons ; first, because the stock always seek the highest land to lie upon, and as the hurdles are advanced they will continue to follow, leaving their dung with regularity ; secondly, the lambs, particularly whilst young, will always draw through the gate in advance of the ewes to receive separate feeding, much better when the folding ascends the hill, than they will when the hurdles are advanced down the incline of the field.

I must now state the best method of feeding. The lambs should be fed first, as this will draw them away from the ewes, and otherwise they are apt to contract the habit of feeding with them, which is objectionable, because the ewes receive the coarser food. Feeding should commence as soon as the shepherd can see in the morning, giving hay first, both to lambs and ewes ; after which, the troughs should be filled with cut roots, taking care to have them cut finest for the lambs, which is done by passing them twice through the cutter, which plan reduces the food into a state resembling dice, in which state the lambs can readily consume it, and are induced to feed at the earliest period, without loss of time and without waste. As soon as the troughs have been supplied with cut roots, then proceed to give oil-cake and Peas, the quantity to be regulated by their wants, always taking care to allow them as much as they will eat. To prevent waste, let the oil-cake be broken fine—about the size of a Horse-bean is the best size—otherwise great waste will occur, for the lambs, whilst young, will take large pieces up and drop them outside the troughs, where it is trodden under foot and wasted. To induce them to eat cake or Peas at first, it is sometimes necessary to mix a small portion of common salt with it. The ewes should next receive their allowance of cake, but without any Peas, commencing with a quarter of a pound per day, the half of which should be given at this time, the other half just before the last bait of roots in the evening. After receiving cake for two or three weeks, the quantity may be gradually increased up to a pound per day each, taking care to feed with only half the full allowance morning and evening. It often happens that the ewes, after they are well advanced in condition, do eat the larger quantity of cake readily, in which case it is advisable to give them the morning bait previous to their receiving any other food. Roots should be given at times during the day, and the trough quite filled at night.

The lambs whilst young should have hay or hay-chaff twice a day ; but after they arrive at the age of eight or nine weeks, they should receive hay three times per day ; the first bait, as has been stated, the first thing in the morning, the second at noon, and the third about 3 o'clock in the afternoon. It will not answer much later in the day ; for in the short days of winter, after the lambs have drawn away from the ewes, they will lie down for the night, and the portion of hay not consumed will, in case of rain, be distasteful to them, and damaged for further use. The lambs, however, seldom consume all the hay, nor should they be required to do so, for it is better that they select the best portions of it, the remainder being removed and given to the ewes. In feeding with oil-cake and Peas, care should be taken to use covered troughs, and the last bait in the afternoon should not be given later than 3 o'clock, otherwise a portion may be left in the troughs, which will be damaged in case of rain, with change of wind during the night-time ; for although the troughs may be covered, yet in damp weather, or drifting rain, the cake will become damaged or unpalatable. Roots for the lambs should be supplied at short intervals, taking care to have any refuse remaining in the troughs removed every morning ; cleanliness in feeding lambs being indispensable. The ewes may receive their oil-cake in open troughs, as they generally eat it immediately they are fed. There is then no time for it to receive damage by rain, &c. ; but the troughs should be turned upside down to keep them dry during the time they are not in use.

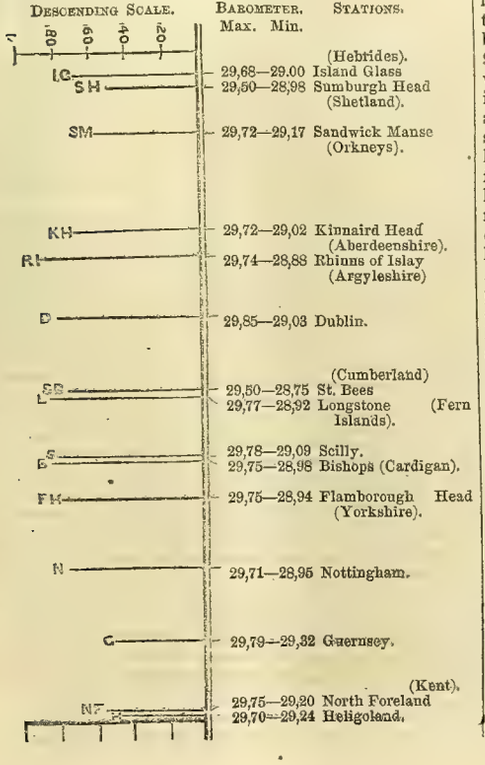
[N.B. This table is to be read comparing it with the diagram at page 243, and beginning at the lowest line.]

In the above Table there are two points to which I would draw the reader's attention :—Firstly, as he carries his eye upwards from one station to another, along the figures which indicate the greatest depression of the barometer, how regularly the hour of that occurrence becomes later ; thus at Scilly it is 3 A.M., but at the Bishop Lighthouse in Wales, not till 9 A.M. ; at Flamborough Head in Yorkshire, not till 9 P.M., and so throughout. Secondly, at those stations which were on the right-hand side of the storm's track, the wind was from the westward at the time when it was from the eastward to those on the left hand ; these two points deserve and will stand a very close investigation.



In the annexed diagram I have endeavoured to give a synopsis of the depression of the various barometers whose readings I have obtained, from Heligoland (the extreme point of observation on the right of the storm's track) to the Hebrides and Shetland, on its left.

I presume I need not explain to your readers that the material thing worth noticing in barometrical fluctuations, is not whether the quicksilver be high or low, but whether it be rising or falling. Thus, if we refer to Flamborough Head in the foregoing table at 9 A.M. of the 27th, the reading is 28·99, which is considerably lower than at 9 A.M. of the preceding day ; and inasmuch as this is a very low reading in August, the inference might be drawn, from a comparison of these two readings only, that bad weather was immediately to be apprehended. But low as the quicksilver was at 9 A.M. of the 27th, it had then been rising for some hours, which shows us that to draw correct and useful inferences we require frequent observations. In the annexed diagram I have, therefore, endeavoured to represent the *amount of depression* of each barometer by the length of the lines on a base taken across the storm's focus at right angles to its axis ; and in two columns I have shown the highest reading previous to the commencement of the depression, and the lowest reading during the depression ; the difference between these readings is the length of the annexed line. The respective dates of the *Max.* and *Min.* are given in the table which appeared at page 203. The distance between the lines, as the annexed diagram is held, north-west and south-east, *across* the line of the storm's course in the large diagram, represents the distance of each point of observation from the storm's axis.

I have by me the materials for tracing all the storms which passed over England during the first half of the year 1851, and I have no doubt that any one of them would have served the purpose of meeting "*R.'s*" challenge just as well as this storm of which I am now treating. But, setting aside other reasons (such as the materials being in my hand, with a diagram ready drawn when I read "*R.'s*" challenge, the comparatively recent period at which it had occurred, and the somewhat unusual season of the year), I was particularly desirous of availing myself of the fact that, in a paper (to be published next week) with which I have been favoured by Dr. Lloyd, the President of the Royal Irish Academy, I am enabled to lay before your readers a series of observations which brings to a practical and most important bearing the remarks with which I have trespassed at such length on your columns. *F. P. B. M.*

(To be continued.)

Home Correspondence.

Hydrophobia.—I notice that the subject of mad dogs is becoming of serious import. For some years in the north of England this pest has been experienced ; but fortunately by the example of a gentleman of Wolsingham, who shot his dogs which were suspected of having been bitten by a mad dog, and this being adopted by others, the evil was arrested. Yet we must not look to such a practice as an efficient remedy, and legislation is the proper appliance to fully eradicate this mischief. The late Mr. Blain stated his conviction to be, from his long and intimate practice, that no case of rabidness in dogs had ever come under his notice which could not be traced to a bite from some strange dog. It is also admitted that this malady is chiefly, if not entirely, propagated by dogs kept by parties who rarely feed or house their dogs—persons in low circumstances, and whose dogs roam about subjected to all vicissitudes of both weather and food, ever just in the way of being bit, and if appearing ill are never cared for or even observed ; also, these are the animals for which no duty is paid. It appears to me that to properly enforce the payment of the duty on these would be the grand cure, and to attain this desideratum I suggest that the erroneous principle of last year's act be changed, which is unfairly applied, more especially to the agriculturist and resident in the country. It is clear that to be allowed by the public to have one's dog follow one, with freedom to be in the public streets, is a privilege and luxury, for which a duty should be paid. At present the duty is for keeping a dog. I therefore propose that the present duty of 12*s.*, &c., be charged for a free license for our dogs to be in the public highways, either alone or with any one. To secure the payment for this purpose, each dog should have a Government badge, with a number and marks agreeing with the registry of the payment of the tax and description of the dog, and a copy of the same registry should be given to the owner, or a certificate entitling him to this right. The police would be proper parties to take and destroy, under proper regulations, any dog wanting this Government badge on its collar. It is obvious how soon all these wretched dogs, more than half starved, would under such a law, be provided for. The late act making the lowest duty on dogs 12*s.*, will fall heavily on the rural classes who reside away from other habitations. It is self-evident that watch and house dogs are a very efficient branch of police for the prevention of crime, which should be the real aim and spirit of our laws. Once let a person take the

first step to theft, and the chances are he will make further progress in the evil pursuit. How often would such a primary step to crime be taken, were it not for the ceaseless and ever faithful watchfulness of our dogs over property beyond the limits of police or any other protection! And with what security many a nervous and lonely person sleeps during the hours of night, confiding their persons and property to the protection of a watch or house dog! These parties also contribute to the police rate, and it does seem unfair that they should also be called on to pay for keeping a dog, which, in fact, renders national service. I would, therefore, suggest that watch and house dogs, kept exclusively for such purposes, pay no tax, or say 1*s.* per annum, to obtain the registry or certificate, and badge for collar; and that such dogs be confined entirely to the premises, or otherwise be liable to the usual tax, if allowed to roam or follow parties on public roads or paths, or employed for sporting. It must be needless to offer any reasons for subjecting our dogs to be thus badged and under the control of the police, for these police are numbered and lettered, cab and omnibus drivers and conductors are badged—and, if I pay my dog-tax, why should I not have proof of it on the dog, whilst the many who now do not pay for their dogs carry the same appearance? I trust that this matter will meet with that attention which it deserves. *W. Wooler.*

Thin Seeding.—Well may the advocates of what may be called very thin seeding deprecate the sin of wastefulness in the customary sowings of our grain crops, if it is found that the acreable produce from their so thin sowing is generally equal to the ordinary thin sowings as well as to the more general thick sowings, despite of all the injuries the plant is subject to in its growth, and the seed in its germination. And as every saving effected in the seeding of land, both as affecting the additional quantity of the food thus freed to the use of the people, and as lessening to the farmer of the expense of raising it is desirable, so every fact tending to confirm the experiments of the very thin seeders must be worthy of attention. The Messrs. Hardy have very much pressed on us the trial of dropping isolated seed at considerable distances, and attribute much to their being so isolated; my respected friend the Rev. Mr. Wilkins has also repeatedly enforced upon us the benefits of such very thin sowings in the large returns he obtains by sowing singly, and at great distances, allowing large areas for each plant, even so much as two square feet; the extraordinary produce obtained by the Hardys from three plants of Wheat occupying a square yard, or three square feet each, has been before our readers, and such thin seeding has also found some other supporters. Our prejudices are against it; are they anything more? Do we find the casualties we apprehend affecting sound seed carefully sown where the subject has been attended to? Some years ago I found in a small experiment, in which from one to eight seeds were dropped in a hole, that the larger number were not more productive; and that where any produced not, every seed in the hole was abortive or nearly so; that where from one hole of seed (the holes were 4 inches apart) a very few stems were produced, from the next the number of stems was so great as amply to make up for the deficiency in the neighbouring one, and that these drills, sown with seed dropped 4 inches apart were more productive than those where four times the quantity of seed was closely sown, the drills 21 inches asunder. But in thin sowing, after-working sufficient to keep down weeds must always be presupposed, for weeds will as effectually prevent an abnormal produce of these thin sowings as additional plants do in thick sowings; and indeed they will be more effectual in working out this abortive process; as children of the soil they have and exert superior claims on the nutritious juices of their mother earth. Under the very unfavourable conditions of a harsh and dry spring to the perfect tillering of plants, I sowed last year in the middle of April—in double rows, 1 foot asunder, with intervals between each pair of rows of 4 feet—Barley dropped singly at 6 inches, 3 inches, and 1 inch from each other; the return from each experiment has been the same, each producing 11 sheaves, weighing 6 lbs. a sheaf. Some time since, I presumed to offer some objections to the three rows of my benevolent friend, the Rev. Mr. Smith; I was led to think that the conditions of the central row were in many respects so disadvantageous to it, that it would necessarily be less productive than the external rows. It is very evident that the central row does not enjoy an equal area either of soil or atmosphere with the external rows, nor the same advantages of a deep working of the soil proximate to its roots. To test this opinion, on the 10th of last April I sowed two sets of double and treble rows of Barley, each row 16 inches apart, the seed dropped singly 3 inches from one another, and each set of rows separated by intervals of 5 feet 4 inches, sown with three rows of Carrots, also at 16 inches apart; thus the double rows of Barley occupied a breadth of 2 feet 8 inches, and the treble rows 4 feet. The produce of the two rows was as four to five of the three rows, while the breadth of ground occupied by the grain was as two to three; of the whole ground, two-fifths were occupied by the double rows, and one half by the treble rows; thus, with the loss of only one-fifteenth of Barley, there is a gain of one-tenth of Carrots in the double rows. This was in the first set of experiments; in the second, the advantage was something more in favour of the double rows. It was remarked in the reaping, that the centre rows did not fill the hand so well as the outside rows. *J. M. Goodiff.*

Societies.

ROYAL DUBLIN SOCIETY'S CATTLE SHOW, *April* 18.—The annual exhibition of stock and implements, for the improvement of agriculture in Ireland, commences this day, and a short notice thus early may interest many of your readers who will not have the happiness of witnessing this, the best exhibition of the many I have seen through the agency of this, the first society ever established for such purposes in her Majesty's dominions.

In the cursory view which I was able to take of the stock, just as the yards were closed yesterday evening, I was enabled to discover, both in numbers and character, an improvement first in the young breeding stock of horned cattle, which were evidently an advance on last year's show. So with swine; and as to breeding sheep, the character and quality of those now for inspection here far exceed those witnessed on any former occasion. The numbers of such stock have never been at any former period great in Dublin; but thanks to railways throughout Ireland, and steam communication with the other parts of the kingdom, Dublin may now be said to be as near Connemara and Cumberland as it formerly was to Carlow and Carlingford. Poultry, the Irish cottager's main stock, are now displayed in a profusion truly astonishing: and, speaking of poultry, as I was coming in by the railway yesterday evening, I fell into the company of a cottager bringing up his little stock, consisting of one cock and two Cochin China hens, a common hen, and six chickens of the Cochin breed for sale. I asked him what he would take a couple for the chickens. He answered, "One guinea," saying at the same time "I do not care to sell them to you, as I can get the same price for them at home, as I have already done for 20 couples of the same age, all hatched since last January." I asked him how much land he held, and what his rent. He said, "Five Irish acres at two guineas an acre." "Well," said I, "you have already sold, of poultry alone, the amount of two years' rent in less than a quarter of a year." He said "Yes; and expect to sell as many more guineas' worth before the harvest comes in." "You keep a cow," said I, "rear her calf, and fatten a pig or two each year; do you not?" "Yes," said he, "I keep one cow, and her yearling heifer is now worth seven guineas. I fatten three pigs each year, kill one for my family at Christmas, one at Easter, and the other before harvest. I sold my cow fat last week for 16*l.*, and mean to give 20*l.* for a well-bred springer at the auction this week. I mean also to give five guineas for an improved breeding sow, and will henceforward breed my own pigs for sale, and otherwise." "Your land must be good," said I, "when you can pay such a high rent and support your family so well. Do you keep a horse?" "No," said he, "my land is but 'cut away bog;' I keep no horse, but keep a donkey for drawing bog stuff and lime for manure. My father used to keep a horse, but it ate the whole produce of the farm and left us starving. I cultivate my little farm with the spade. Some of my neighbours keep horses on larger farms of good land, at 25*s.* an acre, and they have not 'a penny to jingle on a griddle,' though, having three times as much of the good land at the low rent as I have of the bad land at the high rent. In fact," said he, "one of them is my landlord, and it is my wife that gives them milk when she has it to spare for the children with their yellow-meal stirabout." "Well, now," said I, "if you had more land, would you not be still more comfortable?" "No," said he, "my children are not yet able to help me. If I had more land I should keep a horse; I'd lose my time after him, and then should hire men at 2*s.* a day to do my work, who would not give me 6*d.* value, as I could not *watch* them." "Our countrymen," said I, "surely are not so lazy now, when such good wages can be got?" "Bless you," said he, "the good wages did not come time enough. All the good labourers are gone to America or working on the railroads, and we can get none to work now but the vagabonds that would not go away or get any one to take them. But," said he, "I have a son at one of the agricultural schools, and when he leaves it I will take more land, and get some of the new implements he tells me he is taught there to work with." And speaking of implements, the collection now exhibited at the Royal Dublin Society is indeed very fine; and *we want them.* As a proof that we do, I visited a farm of large size yesterday, said to be the best managed in the county, and what did I see there? two ploughs drawn by three fine horses each, "backstirring" land for Mangold Wurzel. I said to the owner, an old friend, "Here you have six fine well-fed horses and four men, doing less work, and that less effectually, than could be done *with two horses and one man* with a suitable grubber." Showing him his loss thus—

6 horses at 3*s.* 6*d.* a day	£1	1	0
4 men at 1*s.* 6*d.* a day	0	6	0
		1	7	0
Deduct:—			
2 horses at 3*s.* 6*d.*	0	7	0
1 man at 1*s.* 6*d.*	0	1	6
		0	8	6
Loss daily	£0	18	6

Or weekly, for he has a week's work in preparing his land for Mangolds, 5*l.* 12*s.*; or four weeks for his general green crop, 22*l.* 8*s.*; or the rent of 15 acres of land, at 30*s.* an acre. This he soon understood, and resolved to purchase and apply one of the fine grubbers now exhibited. But I have wandered from my immediate subject, yet I hope not far outside the objects contemplated by the Royal Dublin Society, who have still much to do in their arduous task, and still much to learn, like our Irish farmers, in their mode of doing it. More hereafter. *E. Carroll.*

Miscellaneous.

The Lenton Herd of Short-horns.—Mr. Wilkinson's celebrated herd was sold by Mr. Strafford Thursday week. We quote from the *Nottingham Herald.* Mr. Strafford stated that the herd had occupied Mr. Wilkinson's attention for upwards of 40 years. Many of the animals had been bred from a cow of Mr. Charles Colling's, and the bull Favourite, to which he had alluded in the pedigrees as comprising the best blood in the county of Durham. Mr. Wilkinson, and his father before him, had paid every attention to the improvement of the breed, and Mr. Wilkinson had made periodical visits to the seat of the short-horns, having been a frequent visitor of Mr. Charles Colling. He should direct their attention to particular animals as he passed along; he might just state that for hair, symmetry, character of flesh, and constitution, they were all that could be desired in short-horns. The animals, commencing with "Old 'Zeal,'" purchased at the Wiseton sale in 1846, she and her progeny being the mothers of 15 calves now living, and two lost, were then put up and disposed of. We can quote only a few of the prices.

COWS AND HEIFERS.

Lot.	Name and Colour.	When Calved	Sold for Gs.
1	Zeal, by Roman, w.	May 1837	31
6	Wiseton Lady, by Humber, roan ...	May 20, 1847	90
7	Roman 9th, by Will Honeycombe, roan	July 31, 1847	92
8	Roman 10th, by ditto, roan	Aug. 20, 1847	50
12	Phœnix, by Will Honeycombe, w. ...	April 26, 1848	165
14	Zeal 4th, by ditto, w.	Mar. 31, 1849	68
18	Roman 13th, by Will Honeycombe, roan	Sept. 24, 1849	90
19	Zealous, by St. Albans, roan	Mar. 18, 1850	130
20	Lenton Lady, by Eclipse, red	April 25, 1850	51
25	Lavender 3d, by St. Albans, r. and w.	Aug. 5, 1851	110
29	Lancaster 17th, by Prince Royal, w. ...	Feb. 21, 1852	91
30	Roan Lady, by St. Albans, roan ...	April 18, 1852	90
46	Pomp, by St. Albans, roan	Oct. 10, 1853	55
47	Roman 16th, by Monarch, w.	Nov. 14, 1853	26
	BULLS.		
5	Monarch, by ditto, w.	April 9, 1851	75
7	Lively Boy, by St. Albans, red	April 29, 1852	56
9	Splendid, by St. Albans, roan	April 11, 1853	110
13	Superior, by St. Albans, roan	Feb. 28, 1854	61

The average price realised by the cows and heifers was 47*l.* 9*s.*, and that realised by the bulls, exclusive of one or two calves, also 47*l.* The aggregate of the sale exceeded 2900*l.* Amongst the purchasers were their Graces the Dukes of Rutland and Marlborough, Earl Ducie, Sir John Crewe, Messrs. Ambler, Dawber, Smith, Dudding, and other celebrated breeders; and Mr. Anthony Cruickshank, of Sittyton, Aberdeenshire. The whole of Mr. Ambler's purchases, with the exception of Wiseton Lady, go to the western world, having been purchased for Dr. Watts and Mr. Waddle, the deputation from Ohio, who have visited almost every part of England, Ireland, and Scotland as well as France, making purchases of prime stock for transshipment to America.

Adulteration of Guano. Lang v. *Chope.*—A report, too long for our columns, is given in the *Exeter and Plymouth Gazette* of last week of a trial connected with guano fraud, which seems to have injured a number of Devonshire agriculturists, as well as Mr. Lang, the merchant by whom they were supplied:—

Mr. Crowder stated the case. The plaintiff is Mr. Isaac Lang, a merchant residing in Exeter; and the defendants, Messrs. Chope, are merchants at Bristol. The action was brought to recover damages, on the ground that the plaintiffs had supplied the defendant with three quantities of guano, which were not according to contract. On the 8th of March, 1853, they wrote to the defendant telling him that they had a quantity of Bolivian guano, which, as there was no Peruvian guano in the market, was becoming scarce; and they therefore recommended their friends to purchase it. Accordingly, on the 24th of March Mr. Lang, having previously received a sample with an analysis, which was stated to have been made by Mr. Herapath, of Bristol, forwarded an order to the defendants to supply him with 100 tons according to sample. He (Mr. Crowder) would be able to show them that Mr. Herapath had made no examination whatever of it, but that the analysis which Messrs. Chope sent was false and fraudulent. At that time, however, Mr. Lang was not aware of that fact, and as the defendants frequently wrote praising the article, and telling him it was daily becoming scarcer and dearer, he sent them two further orders for 5 and 10 tons respectively, which he received by railway from Bristol. Shortly after its arrival, some suspicion was entertained as to its genuineness, and Mr. Lang had an interview with Mr. Chope, sen., at Bristol, who assured him that the guano he had sent him was equal to sample, and was imported by the ship Cable. This satisfied Mr. Lang's mind, and he issued advertisements, mentioning that the guano he was selling was good Bolivian ex-Cable, appending also the analysis of Mr. Herapath. He (Mr. Crowder), however, would be enabled to prove to them that the guano in question never was imported, but that it was manufactured at Greenwich. The advertisements issued by Mr. Lang caused a large sale, and it was soon discovered by his customers that they had been deceived, the article which he had sold them being altogether spurious. The reputation of Mr. Lang was thus greatly injured; and Gibbs & Co., of Bristol, the sole importers of Peruvian Guano into this country, declined, according to their invariable rule, to supply him with any more of that article. His business was thus greatly injured, and it was absolutely necessary that he should bring the present action to clear his character. In consequence of the complaints he received, he had an analysis of the guano he had received from the defendants made by Messrs. Herapath and Nesbitt, who both declared it to be spurious.

We add that portion of the evidence relating to the spuriousness of the guano:—

George Jones stated that he was foreman to Messrs. Cooke and Co., at Greenwich, in April, 1853, and assisted in manufacturing guano; they used loam (a substance looking much like sand), breccia, turf ashes, and salt. Witness remembered a cargo being shipped in the Integrity by the lighterman Allen. The various ingredients were mixed with a shovel, and it took about ten hours to prepare 50 tons. There were about 10 tons of loam to 50 tons of guano. When the article was manufactured it was put in bags, some of which were new, but others were old ones which had contained Peruvian guano.—Mr. Herapath, analytical chemist at

Bristol, stated that the analysis which he received from the plaintiff, who had obtained it from Messrs. Chope and Son, could not possibly be the analysis of the guano which Mr. Lang forwarded him. He did not recollect having made the analysis, and it certainly was not in his handwriting. One pound of the sample thus analysed was worth 21 lbs. of farm-yard dung, that was, judging from the nitrogen. In the sample taken from the Integrity, one pound was only equal to 5 1-10th lbs.; and if it was guano at all, it was very bad. It was just such a kind of article as could be made by the ingredients named by the witness Jones. Since he had been in Exeter he had examined the bulk received by the Integrity, and after turning it over in the various bags, he discovered a few lumps of real guano near the mouth; the remainder was very much inferior. The guano in the sample ton which was forwarded to the plaintiff was more than twice as good as that taken from the Integrity. Nitrogen and phosphate were the two principal ingredients of guano. There were not more than three or four pounds of the pure article in one bag.

His Lordship summed up.—He said he would take their opinion upon the important facts in the case by reducing all the points into three questions. In the first place, the claim was made in respect of 100 tons of guano, which Mr. Lang alleged he bought with the warranty that it was Bolivian, and, according to sample, and it would be for them to say whether or not that was the case. The second point was as to whether or not the same arrangement which was made for the first 100 tons extended to the 15 tons which were ordered subsequently. The third question was a much wider one. It was whether the warranty given with the guano was false to the knowledge of the defendants.—On all these questions the jury gave a verdict for the plaintiff. For the first 100 tons of guano they gave 150*l.* damages, the difference between the cost price of the guano and the amount at which it was selling at the time. On the 15 tons, the greater portion of which had been sold, they took off two-thirds, amounting to 84*l.*—His Lordship said there was one more point upon which it would be necessary for them to give their decision. Mr. Lang claimed special damages, on the ground that he had sustained great loss in his business, as well as in his reputation by the sale of the guano, which they had found to be spurious, and which there was no doubt was manufactured at Greenwich.—The jury again consulted, and in a short time returned a verdict for the plaintiff, by his lordship's permission, on the whole of the counts, giving him 400*l.* damages. This included the 150*l.* and the 84*l.*, the balance being given as special damages.

Poultry.

POULTRY: *A Z.* We consider that some of the symptoms which you describe indicate roup, and therefore recommend you, immediately you perceive that the eyes of the birds look watery, to confine them in a dry place, and give a tablespoonful of castor-oil, taking especial care that they are supplied with no water that is not perfectly fresh and pure.—*A B.* It is, in our opinion, a bad thing to give fowls egg-shells. They supply nothing that is not equally furnished by lime, and especially bricklayers' rubbish, old ceilings, &c. Never do anything that has a tendency to make them eat eggs. They are apt scholars. They will do well in the place you describe, provided the floor of the roosting-house be of earth. If they find worms in a natural way they are good food, but it is a bad plan to give them by the handful. The colour of a golden Poland cock is not very essential, provided it be uniform, and the spangling regular, the legs a good clear blue, and the wing well laced. The top-knot should not have too much white.

Calendar of Operations.

APRIL.

BERWICKSHIRE MERSE FARM, *April* 18.—Our seed time was satisfactorily concluded last month, with the exception of some very few breaks of Turnips yet unconsumed by sheep. Lammermuir was forward this year; but at considerable risk from frost, which they have been lucky enough to escape, though threatened with a second storm on the 21st ult. The case has been far otherwise on the clay soils of our south-east districts; where I have lately seen harrows leaving scarce a trace on the immense blocks of hardened clay, which it were almost useless to touch until softened by rain. We had, indeed, a few slight showers about the middle of last month; and, although they were but a drop to the parched ground, they seemed to have a moderating effect on the previous gales. Pastures are much injured by the cold easterly breezes and long-continuing drought — we can hardly realise the idea of rain now—and heavy hoar frosts at night destroy as much young Grass as is eaten by sheep during the day. This is the more unfortunate, as the great deficiency of Turnips has necessitated a heavier stocking of Grass than is usual at the season. From the same cause, Grass parks have elicited unprecedented competition, and their rents have risen from 35 to 50 per cent. above last year's. Spring corn shows a good braird, but suffers from drought more than winter Wheat, whose roots must obtain sap at a greater depth. Some good showers would put all right; but there is no promise at present of that invaluable boon. The weather has, however, been exceedingly favourable for the cleaning of fallows, and the opportunity has been keenly embraced, under a vivid recollection of the miseries of last season, and consequent failure of the Turnip crop. Potatoes have been planted to some extent, and in first-rate order. On the universally admitted principle of change, we get our seed from poor soils, such as Orkney or Argyll; and such tubers command as high a price as our produce of much superior quality. We find that lime is a preventive of disease to a great extent. Of markets it were useless to speak; for, in these times of electric and steam communication, our prices fluctuate with those at head quarters. *J. S.*

Notices to Correspondents.

DISEASE IN PIGS: *Constant Subscriber.*—The disease in question is peculiar to highly bred and highly fed pigs, and appears to arise from exacting too much from the liver. *W. C. S.*

GAS LIME: *P.* As we stated last week, we doubt its being a disinfector. It is an absorbent of oxygen; whereas, we presume, most disinfectants will act either by furnishing oxygen, or some similar means of combustion, or by furnishing acids, which fix volatile nuisances. A weak solution of green vitriol in water is as good a disinfectant for nightsoil as you can use.

VENTILATION: *Richmond and Chandler.*—In the statement by Sir J. S. Forbes, at a recent meeting of the Fettercairn Club, in a past number of this Paper, as to some Hay-barns, it is usual to build them with narrow openings in the walls, and to consider these ventilation enough.

WEEDS: *P Y.* Rushy Grass land may be improved by drainage, by repeated mowing down the Rushes, and liberal treatment as to manure. If the field is wholly covered with Sedge and Rush, you had better break it up—take a fallow crop, as of Turnips, and relay it. Nettles are to be got rid of by the fork.

ERRATUM: At page 244, col. *a*, from the 10th line—for "and the analogy of action in nitrate of soda, exemplified in Dr. Anderson's address in No. 13 (204 *c*, at foot), the nitrate being the more effective of the two, the intense green that both alike produce; and further, that plants will grow in pure sand and water, and assimilate large quantities of hydrogen, by aid of very little nitrate of soda and no ammonia, the inference appears hardly questionable that the hydrogen is supplied by the water, and that the ammonia acts by supplying nitrogen," &c.,—read "and from the analogy of action in nitrate of soda, exemplified in Dr. Anderson's address in No. 13 (the nitrate being the more effective of the two); from the intense green that both alike produce; and further, from plants growing in pure sand and water assimilating large quantities of hydrogen, by the aid of very little nitrate of soda and no ammonia, the inference appears hardly questionable," &c.

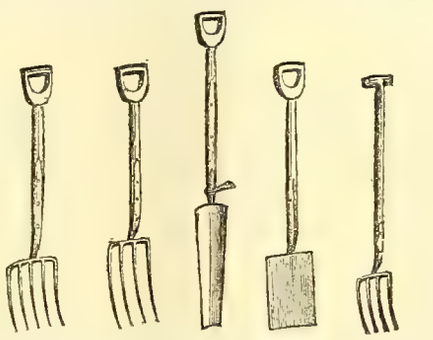
PURVEYORS OF LIVE BIRDS BY SPECIAL APPOINTMENT TO HER MAJESTY AND H.R.H. PRINCE ALBERT.

BAKER'S POULTRY RESTORATIVE.—Ten years' experience of its success, in all Diseases of Poultry, justifies them in recommending it with the greatest confidence; one among its many advantages being the facility with which (in its liquid form) it is administered, obviating the troublesome necessity of handling the birds, and speedily imparting such vigour and high condition that can be acquired by no other means. Price 2*s.* 6*d.*, either in Liquid or in Pills, with directions for Roup, &c. By all Chemists.

BAKER'S REGISTERED FOUNTAINS, for Poultry, Pheasants, and Pigeons, supplant all others. Four quarts, 6*s.* 6*d.*; nine quarts, 8*s.* 6*d.*—Messrs. BAKER, City; and the Pheasantry, Beaufort Street, Chelsea.

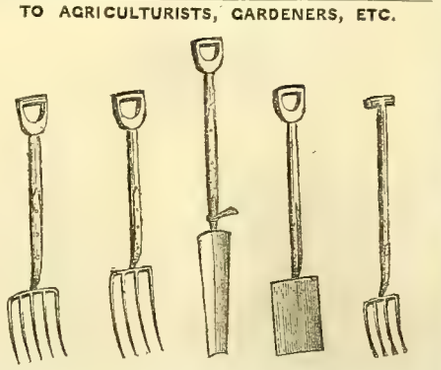
ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

TO AGRICULTURISTS, GARDENERS, ETC.



BENNETT AND NAYLOR, GENERAL IRONMONGERS, and FACTORS, Sole West End Agent for PARKES', late WINTON PARKES' CELEBRATED STEEL DIGGING FORKS and TOOLS. Also for the only efficient Stove, with or without a flue, suited particularly for Conservatories and Greenhouses, Patronised by her Majesty. Price 12*s.*, and upwards, at the Great Western General Ironmongery Warehouse, 255, Oxford Street, between Park Street and North Audley Street, Established for the sale of all descriptions of Ironmongery at Wholesale Prices. Sheet, Hoop, Rod, and Bolt Iron; Locksmiths and Bell-hangers. Patent Fuel, to be used with the Stove, 2*s.* 3*d.* per bushel.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.

Extracts of Testimonials and references to persons using it.

"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*

"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*

"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*

"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bodicott, Oxon.*

"Has been working every day."—*T. Cardus, Barwell, Surrey.*

"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*

"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*

"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"

"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*

"Been digging all the week; the *champion* of all implements in England; should be very sorry to be deprived of it."—*Thomas Lawrence, Thurlaston, Dunchurch.*

Price 24*l.* 10*s.*, the general purpose size; and 27*l.* 10*s.* large size, Cash; at the Works, Banbury.

ENCAUSTIC TILE PAVEMENTS.

MAW & CO., of Benthall Works, Broseley, Shropshire, send Post Free their PATTERN BOOK and FURNISH DESIGNS (with estimates) in this beautiful and durable production to any given plans of Churches, Entrance Halls, Passages, Conservatories, Verandahs, &c.—Specimens at 11, Aldersgate Street, London.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws 30 feet high						...	£4 10
No. 2	„	15	„	„	45	„	...	5 10
No. 3	„	28	„	„	45	„	...	6 18

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws 25 feet high						...	£2 15
No. 13	„	12	„	„	30	„	...	3 5
No. 11	„	16	„	„	40	„	...	4 0
No. 12	„	24	„	„	45	„	...	5 0
No. 14	„	30	„	„	45	„	...	5 18

A large assortment of every description of Garden Syringes Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

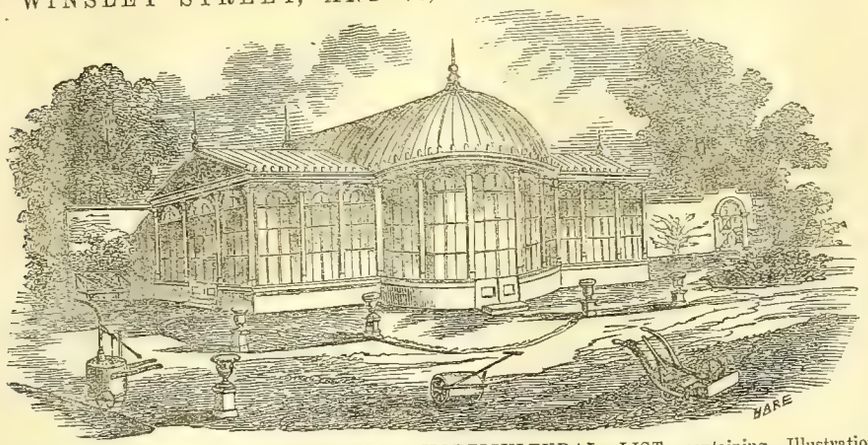
J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. This price does not include carriage, package, or expenses of delivery in the country.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

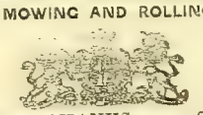
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BUDDING'S LAWN-MOWING MACHINES, with Registered Improvements.

MAPPLEBECK & LOWE, MACHINISTS & MANUFACTURERS, Birmingham.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

IMPROVED MOWING AND ROLLING MACHINE.



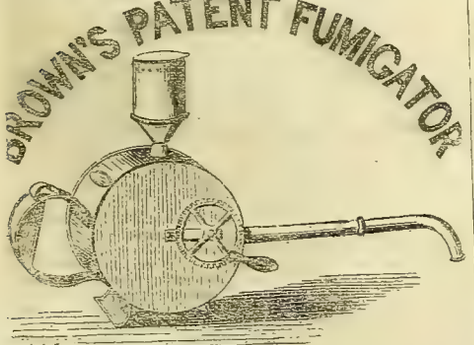
ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cliveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom, as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The Machine is made to cut the breadths of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

Further particulars, with prices, may be had on application.

PRICE TEN SHILLINGS AND UPWARDS.

BROWN'S PATENT FUMIGATOR.



A PORTABLE INSTRUMENT for Fumigating Greenhouses Stoves, and Frames, or Shrubs and Flowers, in the open air, more effectually in conjunction with SANGSTER'S FLORUMBRA without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

TOBACCO PAPER! TOBACCO PAPER!

THE Cheapest and most effectual article for Smoking Greenhouses, and destroying the Fly on Plants, is Genuine Tobacco Paper, which JOSEPH BAKER, of 73, Fleet Street, can supply in large quantities, at 1*s.* per lb.; and if under 7 lbs. at 1*s.* 2*d.* per lb. Post-office Orders payable at the Strand Office.

JOSEPH BAKER, 73, Fleet Street, London (opposite the *Dispatch* newspaper).

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

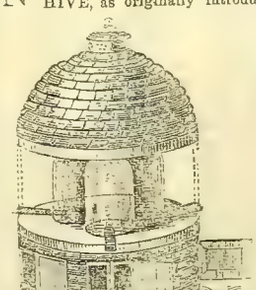
PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order: HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road, London.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.

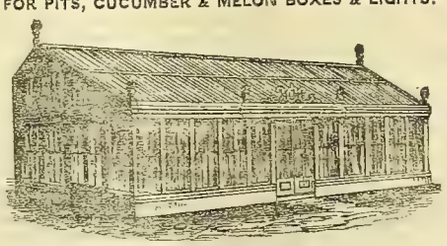


This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, DICKSON & SONS, 16, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

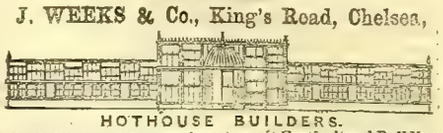


JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in. 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HORTICULTURE IN ALL ITS BRANCHES.

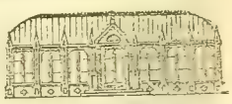
J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



The splendid collections of Stove and Greenhouse Plants, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

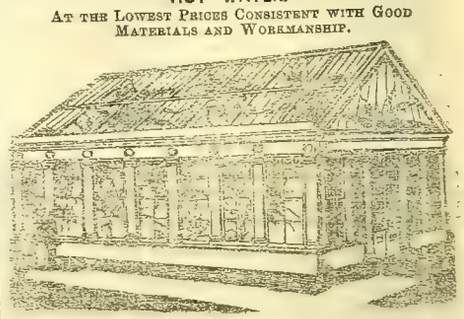
Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1½ in. Greenhouse lights at 3½*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON AND BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

HALL'S GARDEN NETTING

the best protection against
FROST, STORMS, OR SCORCHING HEAT.

GALVANISED WIRE GAME NETTING.—

7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅜-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

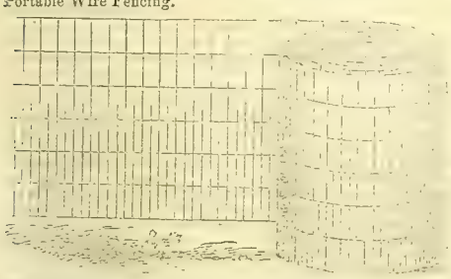
BY HER MAJESTY'S ROYAL LETTERS PATENT.

PORTABLE POULTRY FENCING,

MANUFACTURED BY PATENT MACHINERY.

The great increase in the number and quality of POULTRY in the United Kingdom within the last few years has created a demand for an efficient Poultry Fence, which has called into existence every possible contrivance and adaptation of the Wire and Cord Netting, all of which have more or less proved failures.

B. GREENING & CO. have succeeded in supplying this acknowledged deficiency, by the introduction of a variety of their Portable Wire Fencing.



No. 11. PATENT DOUBLE FENCING (Proof against Poultry and Chickens).

This Fencing (which they manufacture by machinery, patented last year) is light, portable, and elegant in appearance, yet stronger and more durable than any Fence before the public. It requires few standards, and is fixed with the utmost facility by a labourer or gardener.

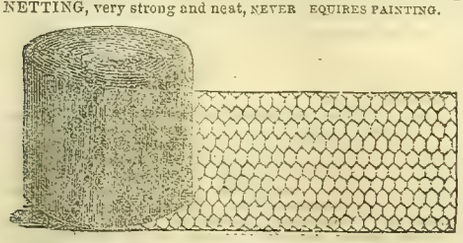
Notwithstanding the present high price of iron, B. G. & Co. offer these superior Fences at such prices as will ensure its ultimate adoption by all.

Cattle Fencing, Sheep and Lamb Fence, Hare and Rabbit Proof Fencing, Ornamental Fencing for Gardens, Poultry Fencing, Trainers for Peas, Garden Bordering, Export Fencing, &c. &c., manufactured by Patent Machinery by BENJAMIN GREENING & CO.

1 and 3, CHURCH GATES, and 2, CATEATON STREET, MANCHESTER,

From whom every information, together with Prospectuses and Engraved Sheets of Patterns may be obtained gratis.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER EQUIRES PAINTING.

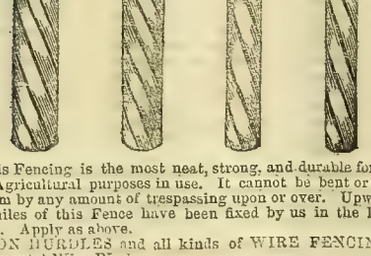


24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

TANNED NETTING,

for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS-MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

HARTLEY'S PATENT ROUGH PLATE GLASS, for Conservatories, Public Buildings, Manufactories, Skylights, &c.

JAMES PHILLIPS AND CO., Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

THE COTTAGER'S STOVE.—

An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50*s.*, and upwards.

THE MECHIAN DRESSING CASE,

the most portable ever invented, being only the size of a pocket-book, containing One Pair of MECHI'S Ivory-handled Peculiar Steel Razor, his Magic Strop, Comb, Badger-hair, Shaving Brush, and Nail and Tooth Brushes, price only 25*s.*; the same with Hair Brush and Soap Dish, 35*s.* To military men, and as a steam-boat or travelling companion, this invention is an invaluable acquisition. An immense variety of other Dressing Cases for ladies and gentlemen, either in fancy woods or leather, at all prices, to suit either the economical or luxurious. An extensive stock of Writing Desks, Writing Cases, Work Boxes, Bagatelle Tables, Razor Strops, Table Cutlery, Superb Papier Maché articles, &c.—Manufactory, 4, Leadenhall Street, four doors from Cornhill.

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.

THE CHOLERA

PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts, 2*s.*; Pints, 1*s.*; Half-pints, 6*d.* Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

HOLLOWAY'S OINTMENT AND PILLS

EFFECT EXTRAORDINARY CURES OF BAD LEGS.—Mrs. M'Gill, of Seel Street, Dublin, suffered for many years with a fearful bad leg, which broke out soon after her confinement; there were several wounds in it, and the swelling was enormous. She endured the most excruciating pain both day and night; and the general opinions of the medical attendants were, that it could not be cured, therefore amputation was the only remedy; however, bad as it was, HOLLOWAY'S Ointment and Pills were resorted to, and these miraculous Medicines soon produced a wonderful change for the better, and ultimately effected a sound and perfect cure.—Sold by all druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

CRYSTAL PALACE GARDEN SEATS AND CHAIRS.—

The Directors are ready to receive Specimens, Designs, and Tenders for the supply of 500 Seats and 2000 Chairs, of the best seasoned wood and workmanship. These articles must be supplied on or before the 15th May next. The Specimens or Designs and Tenders to be submitted on or before Tuesday next, the 25th inst., at the Office of the Secretary, Crystal Palace, Sydenham. By order,

April 22, 1854. GEORGE GROVE, Secretary.

ART-UNION OF LONDON.—

The Annual General Meeting to receive the Council's Report, and to distribute the amount subscribed for the purchase of Works of Art, will be held at the Theatre Royal Lyceum (by the kind permission of Charles Mathews, Esq.), on TUESDAY, the 25th inst., at 11 for 12 o'clock. The receipt for the current year will procure admission for Member and friends. GEORGE GODWIN, } Hon. Secs.
444, West Strand, London. LEWIS POCOCK, }

THE LABORATORY OF THE ROYAL POLYTECHNIC INSTITUTION

is always OPEN for the reception of Pupils under J. H. PEPPER, Esq., F.C.S., A.C.S., &c.

Careful Analyses and Assays of Soils, Minerals, Waters, Mercantile or Agricultural Products, are performed with despatch, accuracy, and economy.

For terms, apply to R. I. LONGBOTTOM, Secretary.

HEAL AND SON'S SPRING MATTRESSES.—

The most durable Bedding is a well-made SPRING MATTRESS; it retains its elasticity, and will wear longer without repair than any other mattress, and with *one* French Wool and Hair Mattress on, it is a most luxurious Bed. HEAL & SON make them in three varieties. For prices of the different sizes and qualities, apply for HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced LIST OF BEDDING. It contains designs and prices of upwards of 100 Bedsteads, and prices of every description of Bedding, and is sent free by post.

HEAL & SON, 156, Tottenham Court Road.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—

The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

DEAFNESS, SINGING NOISES IN EARS.—

SELF CURE.—Extraordinary discovery.—Just published, sent post free on receipt of 16 postage stamps, A STOP TO EMPIRICISM AND EXORBITANT FEES. Every deaf person can restore his own hearing, without absence from home or personal consultations. This book will cure thousands, and rescue them from the grasp of the extortionate empiric. By Dr. HOGHTON, M.R.C.S., London, 2d May, 1845; L. A. C., April 30th, 1846. Consultations every day, Free, from 12 till 4.—9, Suffolk Place, Pall Mall, London.

DEAFNESS.—NEW DISCOVERY.—The Organic

Vibrator, an extraordinarily powerful, small, newly invented instrument, for Deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be produced; being of the same colour as the skin is not perceptible. It enables deaf persons to hear distinctly at church and at public assemblies; the unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Invaluable newly-invented Spectacles. The most powerful Patent Telescopes, possessing such extraordinary power, that some 3½ inches, with an extra eye-piece, will show distinctly Jupiter's Moons, Saturn's Ring, and the Double Stars. Opera, Camp, Race-course, and Perspective Glasses to know the distances. Also a very small, powerful, Waistcoat Pocket Glass, the size of a walnut, to discern minute objects at the distance of from four to five miles. —S. & B. SOLOMONS, Aurists and Opticians, 39, Albemarle Street, Piccadilly; observe, opposite the York Hotel.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL

possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowland's Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR,

WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2*s.*, and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to your Nioukrene." H. ROBB, Esq.—"It has checked the greyness." MRS. JONES.—Sold at 14, Hand Court, Holborn, London.

ELECTRICITY FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MR. MEINIG'S new and greatly improved GALVANIC ELECTRO GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishment, 103, Leadenhall Street. All wet and metallic contact with the body is entirely obviated; it acts with water alone, without acid, the action lasts more than 24 hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck. The extraordinary curative virtues of these mild currents of Electricity are now fully established by experience; the Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last 18 months, and this remedy is now adopted in nearly all the hospitals, and by the most eminent practitioners. Sold at 5*s.* upwards, according to power, at C. MEINIG'S, 103, Leadenhall Street. N.B.—It is impossible when wearing a Generator, to be attacked by Cholera.

STATICE HOLDFORDI.

MITCHELL AND CO., Successors to the late Edward Mitchell, Bristol Nurseries, Kemptown, Brighton, beg most respectfully to inform the trade, that they are prepared to supply strong healthy plants of the above at 25s. 6d. per dozen, package included, for ready money.—Post-office orders payable to MITCHELL & Co., or JOHN FAIRBROTHER.

PERMANENT PASTURE.

R. H. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his Mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., to lay down Land to Permanent Pasture, at 25s. per acre, allowing 3 bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

NEW FUCHSIAS OF 1854, raised by Mr. Batten, who sent out Fuchsia Clapton Hero, which gave universal satisfaction.

MR. CHARLES PALMER, scarlet corolla, white tube, broad inverted sepals, fine habit; 7s. 6d.

GRANDISSIMA, deep claret corolla, long white tube, good habit, 7s. 6d.

ADMIRAL, light crimson corolla, light tube, and a free bloomer, 7s. 6d.

Oxalis, new species from Chili, very large, bright rose-coloured flowers, and an abundant bloomer, 30s. per dozen.

Tropæolum azureum, large sound roots, 30s. per dozen.
" tricolorum " " 15s. "
" brachyceras " " 15s. "
The usual discount to the Trade.
HUGH LOW AND CO., Clapton Nursery, London.

HUGH LOW AND CO. would invite inspection of their large and healthy stock of SOFT-WOODED PLANTS, suitable for Flower Garden decoration, amongst which they would more especially enumerate the under-named. The plants are all established in small pots well adapted for packing. Prices moderate, and purchasers of large quantities will be treated with great liberality. Calceolarias, shrubby and herbaceous; Coleus Blumeii, variegated foliage; Ageratum cælestinum and variegatum; Fuchsias in all the leading varieties; Verbénas, do.; Chrysanthemums, do.; Phloxes, do. Scarlet and variegated Geraniums; Lantanas in many varieties; Pentstemons, do.; Petunias, do.; Lophospermums, do.; Maurandyas, do.; Mimulus, do.; Lobelias (tall and dwarf), do.; Antirrhinums, do.; Heliotropes, do.; Salvias, do. Double Crimson Rocket, Pentstemon purpureum hybridum, superior to all other varieties of P. gentianoides; Cheiranthus Delileanus; Pyrethrum grandiflorum plenum.—Clapton Nursery, London.

NEW ALSIKE CLOVER, Price Ten Guineas per cwt., or in small quantities at 2s. per lb., may be had on application to Mr. H. RAYNBIRD, Basingstoke, Hants. Also New Home-grown ITALIAN RYE-GRASS, of good and genuine Stock, at 30s. to 35s. per quarter.

A. VERSCHAFFELT, NURSERYMAN, Ghent, (Belgium), begs to inform Amateurs and the Trade, that he has just published his New CATALOGUE OF PLANTS for the present spring and summer, which may be obtained on application to his agent, Mr. R. Silberrad, 5, Harp Lane, Great Tower Street, London. A. V. begs to offer also his new work,

"L'ILLUSTRATION HORTICOLE."

Appearing Monthly, with a Number containing three fine coloured Plates, representing the best Trade Plants, accompanied with their description, culture, &c. Price 12s. a year.

The four first Numbers are out, and contain:—

First Number (January), Rhododendron album speciosum, Oncidium Barkeri, Philesia buxifolia.

Second Number (February), Epidendrum vitellinum, Abies bracteata, Sciadocalyx Warscewiczii.

Third Number (March), Maranta Warscewiczii, Azalea indica Beali, Ilex cornuta, Wellingtonia gigantea.

Fourth Number (April), Monochætum umbellatum, Odontoglossum Cervantesii, Skimmia japonica.

WANTED, by a Gentleman, a COTTAGE, of humble pretensions, Unfurnished and Detached. To contain two sitting, two best, and two secondary bed-rooms, kitchen, and convenient out-buildings, with garden, and from 3 to 4 acres of land. Within an hour or less railroad distance from London. The rent must be moderate.—M. D., Peak's Newspaper Office, 111, St. Martin's Lane, Charing Cross, London.

TO BE LET, WALKERN PARK FARM, with possession at Michaelmas, situate 5 miles from the Stevenage station on the Great Northern Railway. The Farm consists of 318 acres of fertile Corn Land, 74 acres of very productive Meadow, and 23 acres of Wood.—Apply to Mr. HUMBERT Land Agent, Watford, Herts.

TO BE LET, for a term of years, a sound Stock and well known compact Corn Farm, with water, and other Meadow Land, altogether about 514 acres, in a most eligible and healthy district in Hants. Good Markets around, and a Railway Station on a Metropolitan main-line within half a mile. Also adjoining and together with the above, or to be let separately, an Arable Farm, of about 200 acres, in a ring fence. Entry for preparations may be had forthwith on both farms.—For a view and to treat, apply to LAMB, BROOKS & Co., Solicitors, Basingstoke and Odiham, Hants.

TO BE LET, with immediate possession, a NURSERY and FLORIST BUSINESS, three miles from Hyde Park Corner, comprising a convenient House, an acre and a quarter of Ground, with five Greenhouses and other conveniences, together with the stock. A good Jobbing Connection.—Apply to N. HUGHES, Nurseryman, near the Church, Hammersmith.

DESIRABLE LEASEHOLD INVESTMENT, FIVE MILES SOUTH-EAST OF LONDON.

TO BE SOLD, for 1500l., THREE GOOD EIGHT-ROOMED HOUSES, held for a term of 72 years unexpired, at a ground-rent for the whole of 10l. 10s. One is let at 42l. a-year, another at 38l., but is worth almost exactly the same as the first; the third is in hand. Part of the purchase-money may remain on mortgage, when the property, fairly let, would yield nine per cent. interest.—Address, W. ROSCOE, Esq., Ensbury, Wimborne, Dorsetshire.

TO PIG AND CHICKEN FEEDERS.—Good Greaves may be had at 10l. per ton, upon application to TAYLOR & PEARS, 8, George Yard, Lombard Street, City.

EGGS from CAPT. HORNBY'S celebrated Spanish and Dorking Prize Fowls may be had on application to Mr. H. D. DAVIES, Spring Grove, Hounslow, to whom Capt. Hornby has transfered his whole stock. Spanish, 4l. 4s. per doz.; Dorking, 3l. 3s. per doz. Remittances to be made by post-office order, and to include 2s. for packing.

PRIZE SILVER POLANDS (Dr. HORNER'S STRAIN).—The Subscriber can now furnish EGGS of the above from the Birds he successfully exhibited the past year at Hitchin, Great Yarmouth, and Norwich, and awarded 11 prizes, price 15s. per dozen; also Eggs from extremely small pure White Bantams (prize Birds), at 18s. per dozen.—Orders, with Post-office order, addressed to Mr. HENRY YOUELL, Church Square, Great Yarmouth, will be promptly attended to.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

COCHIN CHINA FOWLS.

MR. THOMAS GILBERT, of Grays, Essex, having purchased of THOMAS STURGEON, Esq., his entire breed of 1853, Gentlemen and Amateurs are informed the Birds are now on Sale, and are bred exclusively from his best Stock Birds, Jerry and Nelson. Eggs may be had at 16s. per dozen, from the above.

PRIZE BRAMAH POOTRA FOWLS' EGGS, from the stock that took the first prize in England, at Birmingham in 1851; these fine Birds are heavily feathered and vulture hocked, 20s. per doz.; White-faced Spanish Eggs, 10s. per doz.; Speckled Dorking, 6s. per doz.; White Aylesbury Duck Eggs, 6s., per doz. Four Isle of Skye Terrier Dogs for sale.—WM. TURNER DRAYTON, Abingdon, Berks.

BRAHMA POOTRA FOWLS.

TO BE SOLD, a few Sittings of EGGS of this breed (according to priority of application), from the prize and selected birds of a gentleman—Brahmas of whose breeding have, during the past year, taken prizes at the following important Poultry Shows: the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Winchester, Norwich, and Manchester.—W. C. G., Post-office, Sandbach, Cheshire.

TO BE SOLD, EGGS from Prize Birds, from the Yard of CHRISTOPHER RAWSON, Esq., The Hurst, Walton-on-Thames:—Buff Cochins, Spanish, Coloured and White Dorkings, Gold and Silver Spangled, and Pencilled Hamburghs, Gold and Silver Bantams, and Aylesbury Ducks, 12s. per dozen; White and Black Cochins, Gold, Silver, and Black Polands, 21s. per dozen; Brahma Pootra Eggs, from imported birds of the best strains, 2l. 2s. per dozen.—Post-office orders (including 1s. for packing), to be sent with the order. The Eggs will be sent out in rotation according to the date of order.

TO BE SOLD, per dozen, WHITE-FACED SPANISH FOWL EGGS, from Pullets of Capt. Hornby's breed. Also a PULLET nine months old, now laying, and already showing the white face.—For price, &c., direct, H. S. W., North Leigh, near Oxford.

SPANISH AND DORKING FOWLS.—Captain HORNBY having transferred his whole Stock of celebrated POULTRY to Mr. H. D. DAVIES, of Spring Grove, Hounslow, a portion (for want of space) is for immediate sale.

EGGS FROM PRIZE FOWLS.—Black Breasted Red Game, 1st Prize at the Metropolitan Show, exhibited by Capt. Hornby, 12s. per dozen. Silver Pencilled Hamburgh, the parent stock of prize and highly commended birds at Bedford, 4s. 6d. per dozen. Rouen Ducks, from the same strain as the 1st prize birds at Bedford and Liverpool, 10s. per dozen. Any of the above would be exchanged for Eggs from 1st prize Dorkings. All orders executed according to priority of application.—Address, Mr. G. ALLEN, Ampthill, Beds.

EALING PARK SALE.

J. SOUTH, of the Plough Inn, Ealing (two minutes' walk from the Sale), begs to inform Purchasers, who wish to attend the three days' Sale, that they can have every accommodation at reasonable charges. Good Beds, Stabling, &c.

Sales by Auction.

EALING PARK.

MRS. LAWRENCE'S STOVE AND GREENHOUSE PLANTS, AZALEAS, AND HEATHS, THE MOST IMPORTANT AND VALUABLE COLLECTION EVER OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is honoured with instructions (in consequence of the ill-health of Mrs. Lawrence) to Sell by Auction, at the Gardens, Ealing Park, on THURSDAY, 27th April, and following days, at 1 o'clock precisely, this unrivalled Collection of Magnificent Specimen STOVE AND GREENHOUSE PLANTS, AZALEAS and HEATHS, in all about 500. The Plants are so well known that it is sufficient to say they are the finest and best cultivated in the world, in admirable health, well set with bloom buds, and offering to Gentlemen and Nurserymen an opportunity of possessing specimens of transcendent splendour for exhibition at the forthcoming shows.—May be viewed Monday and Tuesday before the Sale, by Catalogues only, to be had (2s. 6d. each, returnable to purchasers) of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

EALING PARK.—THE ERECTION OF FIVE PLANT HOUSES, IN EXCELLENT CONDITION.

MR. J. C. STEVENS will sell by Auction, at the Gardens, at Ealing Park, on SATURDAY, the 29th of April, at about 3 o'clock, after the Sale of the Plants, in Five Lots, instead of One, as mentioned in the Catalogue, a SPAN ROOF HOUSE, 65 feet by 17 feet 6 inches; a ditto, 18 feet by 16 feet; a Treble Span, ditto, 65 feet by 55 feet; a Span, ditto, 18 feet by 15 feet; and a ditto, 65 feet by 17 feet 6 inches, with all the Internal Fittings, about 2500 feet of Hot-water Pipes, four Boilers, Slate and Wood Stages, Stone Paving, &c.—May be viewed with Catalogues, or by special order; to be had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

ORCHIDS FROM GUATEMALA.

MR. J. C. STEVENS begs to notify that he will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 5th May, an IMPORTATION OF ORCHIDS, just received from Mr. Skinner, who is now in Guatemala, and under whose directions they have been collected; they comprise all the splendid varieties from that country, in magnificent masses, and in the best possible condition.—Catalogues are preparing and will be forwarded in due course.

BRAMAH POOTRA, DORKING, SPANISH, COCHIN CHINA, AND OTHER CHOICE FANCY POULTRY.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, May 2, at 12 o'clock precisely, 50 BRAMAH POOTRA FOWLS, of the choicest quality, imported by Mr. Baily; first-class Dorkings, white and buff Cochins, from Dr. Allen and others; some well bred Spanish, Aylesbury Ducks, &c. —Catalogues by inclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. TOOLEY will submit to public competition, early in May, unless previously disposed of by private contract, on the premises, Stockwell Green Nursery, in consequence of the proprietor retiring from the business, several thousands of SCARLET and other GERANIUMS, CALCEOLARIAS, VERBENAS, HELIOTROPES, FUCHSIAS, PETUNIAS, &c. The desirable and convenient Nursery to be Let, with immediate possession, consisting of good Dwelling-house, with Seed Shop, 10 Greenhouses, Pits, Frames, Shed, Stabling, &c.—For further particulars, address Mr. G. TOOLEY, Stockwell Nursery, Stockwell Green, Surrey.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will Sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, April 28, at 12 o'clock, a first-rate Collection of CARNATIONS, PICOTEES, and PINKS, and a fine Assortment of FUCHSIAS, VERBENAS, DAHLIAS in dry roots, AMERICAN PLANTS, GERANIUMS, and other Plants in bloom, with a variety of Hardy Perennial and Rock Plants.—On view the morning of Sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, on the premises, Rush Grove, Woolwich, on MONDAY, May 1st, at 12 o'clock, by order of Mr. J. Grisbrook, leaving the premises, the whole of the Greenhouse Plants, consisting of fine specimen Azalea indica, Erica, Epacris, Aphelexis, Pimelea, Chorozema, Corræa, Diosma, Acacia, Geraniums, Camellias, Cactus, Cinerarias; also Lilium lancifolium, rubrum, punctatum, and album; a quantity of Plants for bedding; 5 capital 1, 2, and 3-Light Boxes, 2 Thermometers, Rustic Seats, Tables, Flower Stands, and sundry effects.—May be viewed two days prior to the sale; Catalogues may be had (6d. each, returnable to purchasers), on the premises; of the principal seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT SALE OF YOUNG SPECIMEN HEATHS GREENHOUSE PLANTS, AND ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions by Mr. Epps, of the Bower Nurseries, Maidstone, to Sell by Auction, on TUESDAY, April 25th, at 12 o'clock, at the Auction Mart, Bartholomew Lane, nearly 300 Splendid Young Specimen Heaths, Greenhouse Plants, and Orchids. The Ericas consist of Obbatas, Hartnellis, Tricolors, Massoni, Ampullacea, vars. ferruginea jasminoides, vars. Cavendishi, Ventricosas, &c., &c.; the Orchids, Cattleya, vars. Dendrobiums, Oncidiums, Brassias, Maxillarias, Cœlogyne, Vandas, &c. It is needless to state that the Ericas grown by Mr. E. are the finest and most healthy plants known; and on no occasion has there been submitted to the public so splendid a collection; they are calculated to suit all purchasers, as they consist of specimens in 8 to 20 inch pots, the bulk in 11 inch pots. The Orchids are choice and valuable species.—May be viewed the day prior to and morning of Sale. Catalogues may be obtained of Mr. EPPS, the Bower Nurseries, Maidstone; the principal Seedsmen in London; at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO TULIP FANCIERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Goldham to submit to public competition by Auction, without reserve, about the middle of MAY next, on the Premises, Ilynder Cottage, Merton Lane, Mitcham, Surrey, a portion of his costly and unrivalled collection of TULIPS. No comment on this magnificent Stock will be equal to an inspection of its striking beauties, for which an opportunity is now offered to the Amateur Florist, &c., new Flowers and Seedlings of Mr. Goldham's raising, the result of more than 30 years' successful cultivation and competition, and which for the first time are now offered. Among these may be named Fanny Kemble, John Kemble, Charles Kemble, Julius Cæsar, Napoleon, Fortunius, Gem, Duchess of Sutherland, Standard, Lord Byron, Marshal Soult, Marshal Blucher, Calphurnia, Emma, Oliver Goldsmith, Othello, Comet biz., Marc Anthony, Sir R. Peel, Lord Nelson, Helen, Picturata, Unique byb., Belvidera, Juliet, Marquis of Anglesea, Unique rose, &c. &c. Among Flowers already out are Pandora, Thalia, Musidora, Byzantium, Salvator Rosa, Homer, Lord J. Russell, Apelles, Duke of Devonshire, Camuse de Craix, Mrs. Siddons, Stein's Victoria, Strong's Eliza, St. Neots, Fanny Ellsler, Parmagiano, Wallace, General Bourmonville, Pentley's Queen, &c. &c. Future advertisements containing further information will shortly appear.—American Nursery, Leytonstone, Essex, April 22.

HIGH ELMS, NEAR FARNBOROUGH, KENT.
IMPORTANT SALE OF SHORT-HORNED CATTLE, &c.

MR. STRAFFORD is again favoured with instructions from Sir John W. Lubbock, Bart., to Sell by Auction, without reserve, at the Dairy Farm, High Elms, Farnborough, near Bromley, Kent, on WEDNESDAY, April 26, upwards of 30 head of SHORT-HORNS, consisting of Young Bulls, Cows, and Heifers, which have been chiefly bred from Cows purchased of Mr. Cartwright, of Tathwell, and since crossed by first-class Bulls from the famed Herds of the late Earl Spencer, Sir C. Knightley, Messrs. Booth, Combe, &c.; also a valuable 3-year-old Bay COLT, adapted for Harness, and a very superior Grey PONY, 7 years old.—Catalogues, with pedigrees and other particulars, may be had of Mr. STRAFFORD, 13, Euston Square, London; or of Mr. STOW, at Farnborough Hall, near Bromley, Kent.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND EXHIBITORS.

ST. MARGARET'S, ISLEWORTH.—THE EARL OF KILMOREY'S MATCHLESS COLLECTION OF ORCHIDACEOUS, STOVE, AND GREENHOUSE PLANTS.

MR. CAIN is instructed to Sell by Auction, on the premises as above (in consequence of the Earl of Kilmorey having disposed of his interest in the premises), on TUESDAY, May 2d, and following days, at 12 for 1, this NOBLE COLLECTION OF PLANTS, consisting of specimens of unrivalled excellency, and comprising all the choice varieties of Orchids, viz., Aerides, Anæctochilus, Bletia, Brassia, Cattleya, Cœlogyne, Cypripedium, Dendrobium, Epidendrum, Miltonia, Oncidium, Peristeria, Phaius, Sobralia, Stanhopea, Vanda, and Zygopetalum. The Ericas comprise fine Exhibition specimens of Cavendishi (very fine), depressa, elegans, Hartnelli, jasminiflora alba, Massoni major, metulæflora bicolor, perspicua nana, tricolor, vestita, &c. &c. About 100 of the choicest varieties of Camellias, of fine handsome growth, with good show of bloom. Two fine specimens of Araucaria excelsa, or Norfolk Island Pine; one 12 ft. high, beautifully furnished, and one 6 feet 6 inches, a fine tree. The collection of Azaleas comprise some of the finest specimens of the most choice varieties. Rhododendrons consist of a splendid collection of rare species, Orange trees of fine and noble growth. The Stove Plants comprise fine specimens of Allamandas, Begonias, Dipladenias, Franciscea, Gardenia, Ixora, Stephanotis, &c. Large American and plated Aloes of the most choice species. The plants are in a healthy state, and present a fine show of bloom;—to noblemen and nurserymen an opportunity of possessing fine exhibition plants for the forthcoming shows. Sculptured Stone and other Pedestals, and Ornamental Vases; a fashionable Chariot, in excellent order; a perfectly new four-oared Rowing Boat, by Salter; a Wager Boat, by Clasper; Garden Tools and Implements; a long, three-tier shaped, iron Flower Stage, and other effects.—May be viewed, by Catalogues only, at 1s. each (returnable to purchasers), one week prior to the sale; to be had on the premises, and of the Auctioneer, King Street, Richmond, Surrey.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, APRIL 22, 1854.

50 Varieties in half-quarter oz. packets	4*s*. "
30 Varieties in packets	3*s*. "

Any kind, in 1*d*. and 2*d*. packets, sent free by post, upon receipt of a stamped directed envelope. Vegetable Seeds of all kinds, Shrubs, Flowers, &c., at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Isliugton, London.

SOFT-WOODED PLANTS, in large variety; suitable for decorating the Flower Garden during Summer and Autumn. To be had at low prices from the subscribers,

HUGH LOW & CO., Clapton Nursery, London.

TO BE SOLD, FRENCH GARLIC, of superior quality.—Apply to A. and A. DAVENES, 22, Turnmill Street, West Smithfield.

TO BE SOLD, at a moderate price, a fine specimen of FAN PALM, or CORYPHA UMBRACULIFERA, 9 feet high and 12 feet in circumference, some of its leaves 6 feet across.—For further particulars address to THOMAS COOLING, Micklegover, near Derby.

STATICE HOLDFORDI.

MITCHELL AND CO., Successors to the late Edward Mitchell, Bristol Nurseries, Kemptown, Brighton, beg most respectfully to inform the trade, that they are prepared to supply strong healthy plants of the above at 25*s*. 6*d*. per dozen, package included, for ready money.—Post-office orders payable to MITCHELL & CO., or JOHN FAIRBROTHER.

BEDFORD NURSERY, ACRE LANE, BRIXTON.

W. J. SANGSTER begs to say he is prepared to send out his admired New Seedling GERANIUM the "BEAUTY OF CLAPHAM," an excellent variety for pots and bedding culture, noticed in *Gardeners' Chronicle* as a beautiful rosy pink, and a very pretty variety. Good strong plants, 7*s*. 6*d*. each. Also a great variety of Bedding plants at 4*s*. per dozen, and every kind of Nursery Stock at very moderate prices.

NEW DAHLIA—MAGNET.

CHARLES KIMBERLEY is now sending out the above beautiful Dahlia; colour, ruby crimson, very constant, of first-rate form, one of the best flowers of the season; was awarded a Certificate at Brighton Open Show, September 14th, and National Society, London, September 22d. Strong Plants, 10*s*. 6*d*. each; usual allowance to the Trade. Catalogues of Dahlias and Miscellaneous Choice Plants may be had on application.—Stoke Nursery, near Coventry.

BEAUTIFUL NEW BEDDING PLANT.
MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s*. per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

BEAUTIFUL NEW PETUNIA.
"MONTREAL PURPLE" (SMITH.)

W. F. SMITH, Riverhead Nurseries, near Sevenoaks, will be prepared to send out, on and after May 1st, strong plants of the above splendid Petunia, at 3*s*. 6*d*. each. This variety possesses a first-rate habit, and produces fine large bold flowers of good form, well above the foliage; and it has proved to stand the wind and rain better than any other variety.

W. F. S. is confident that the above will give as much satisfaction as the Geranium "Lady Holmsdale," and Calceolaria "Beauty of Montreal," sent out by him in 1852. W. F. S. has also some splendid Plants for vases of Geraniums "Lady Holmsdale" and "Flower of the Day," at 20*s*. to 30*s*. per dozen.—Catalogues of Stove, Greenhouse, and Bedding Plants may be had on application.

CAPE HEATHS AND NEW AZALEAS.

W. J. EPPS begs to call attention to his extensive and rare Collections of Heaths and Azaleas, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora ventricosa, Massoni, Webbiana, obbata, &c., &c. AZALEAS—Prince Albert, Gledstanesi, Excelsa, Murrayana, Alba magna Duke of Devonshire, Holderi, Toilette de Flora, Glory of Sunning Hill, Symmetry, Splendens, Ignescens, &c., &c., 9*s*., 12*s*., 18*s*., and 21*s*. per dozen; 5*l*. per 100 varieties, carriage paid to London. All the new Stove and Greenhouse Plants, Fuchsias, Verbenas and Roses, equally moderate. Catalogues of the above sent on application.—Nurseries, Maidstone and Ashford.

"WELLINGTONIA GIGANTEA."

MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant ... 2 guineas	For 8 Plants ... 10 guineas
For 4 Plants ... 6 guineas	For 12 Plants ... 12 guineas

And all orders will be executed strictly in the rotation in which they are received.—April 29.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7*s*. 6*d*. each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—April 29.

NEW ALSIKE CLOVER, Price Ten Guineas per cwt., or in small quantities at 2*s*. per lb., may be had on application to Mr. H. RAYNBIRD, Basingstoke, Hants. Also New Home-grown ITALIAN RYE-GRASS, of good and genuine Stock, at 30*s*. to 35*s*. per quarter.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to call attention to their MIXTURES OF GRASS SEEDS for laying Land down to Permanent Grass, price 30*s*. per acre.

Mixed sorts, for Improving Old Grass Land	1*s*. 2*d*. per lb
Fine sorts for Forming and Renovating Lawns	1 3 "

Directions for sowing accompany the seeds.

GEORGE GIBBS & Co. will be happy to forward their Priced Catalogues of Mangold Wurzel, Carrot, Swede, Turnip, and all Agricultural Seeds, free on application to GEORGE GIBBS & Co Seedsmen, 26, DOWN STREET, Piccadilly, London.

WILLIAM BARNES begs to inform his friends and the public generally, that his SPRING CATALOGUE is now ready, and can be had on application; it contains all the leading and most approved varieties in cultivation, of Indian Azaleas, Cinerarias, Calceolarias, Verbenas, Fuchsias, Hollyhocks, Phloxes, Roses, Geraniums, Chrysanthemums, Perpetual blooming Carnations, Petunias, Delphiniums, and Liliums, with many other plants too numerous to insert here. W. B. has much pleasure in stating his stock is exceedingly healthy and clean and warranted true to name.—Camden Nursery Camberwell.

SPLENDID NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that his beautiful New Seedling Shrubby CALCEOLARIAS are now ready to send out, in two sets, viz., First Set of 15, 3*l*.; Second Set of 15, 2*l*. For description, see Catalogue, which may be had on prepaid application.

H. M. offers a third set of 20, to include some of his very best sorts sent out the two last years, as well as several of last year's Seedlings not yet let out, price 30*s*.

OPINIONS OF THE PRESS UPON MR. MAJOR'S CALCEOLARIAS.

"Mr. HENRY MAJOR, of Knosthorpe, near Leeds, has devoted much time to the improvement of the Shrubby Calceolaria, and to him, perhaps, more than any other individual, we are indebted for the perfection and beauty which have been obtained in this class of plants. Mr. MAJOR has, this season, a splendid lot of seedlings."—*Abridged from the Durham Advertiser, May* 13, 1853.

"H. M. We never before saw a collection of Seedling Calceolaria blooms, for perfection in form and beautiful colouring, equal to yours; they are far superior to any we have seen at the London Exhibitions."—*Floricultural Cabinet, July*, 1853.

"H. M. As a whole, the best collection of Calceolaria Seedlings we have seen this year."—*Abridged from the Cottage Gardener, June* 16, 1853.

"Z. Z. Your varieties are of the right stamp, something different from the interminable yellow and brown. We like No. 5 best; it is a very lively and novel variety. Next 43, then No. 3. The others are very pretty."—*Midland Florist, August*, 1853.

Very choice CALCEOLARIA SEED, 2*s*. 6*d*. per packet.

Orders from unknown correspondents, inclosing Post-office order, will be punctually attended to. Postage stamps are respectfully requested in payment of the seeds.

A. VERSCHAFFELT, NURSERYMAN, Ghent, (Belgium), begs to inform Amateurs and the Trade, that he has just published his New CATALOGUE OF PLANTS for the present spring and summer, which may be obtained on application to his agent, Mr. R. Silverrad, 5, Harp Lane, Great Tower Street, London. A. V. begs to offer also his new work,

"L'ILLUSTRATION HORTICOLE."

Appearing Monthly, with a Number containing three fine coloured Plates, representing the best Trade Plants, accompanied with their description, culture, &c. Price 12*s*. a year.

The four first Numbers are out, and contain:—

First Number (January), Rhododendron album speciosum, Oncidium Barkeri, Phlesia buxifolia.

Second Number (February), Epidendrum vitellinum, Abies bracteata, Sciadocalyx Warscewiczii.

Third Number (March), Maranta Warscewiczii, Azalea indica Beali, Ilex cornuta, Wellingtonia gigantea.

Fourth Number (April), Monochætum umbellatum, Odontoglossum Cervantesii, Skimmia japonica.

EUGENIA UGNI, a very fine new Myrtaceous plant, recently received by the Subscribers from Mr. Bridges, of Valparaiso, will prove hardy in most parts of Great Britain. It is figured in the January number (1853) of Curtis's "Botanical Magazine," and Sir William Hooker describes it as forming a charming Evergreen Shrub, the flowers and leaves of which are fragrant. This peculiarity alone would be sufficient to ensure its general cultivation, independent of its merits as an ornamental shrub of easy culture. Small established plants 21*s*. each. No discount unless three are ordered.

LAPAGERIA ROSEA; young plants in a growing state, 31*s*. 6*d*. each.

AZALEA INDICA (Beauté de l'Europe).—A new variegated variety of great merit—received a First Class Certificate at the National Floricultural Society, also at the Exhibition of the Society of Horticulture, of the Seine, held at Paris in March, 1853. It is one of the most abundant flowering Azaleas in cultivation. Price 7*s*. 6*d*.

BORONIA DRUMMONDI.—In the style of B. pinnata; colour, beautiful rosy crimson. Unlike other species of this genera, that now offered is of extremely easy culture, elegant habit, and will undoubtedly prove the finest greenhouse plant suitable for exhibition purposes that has been introduced to this country since the Subscribers offered for the first time Pimelea spectabilis. Price 7*s*. 6*d*. each. From the last three Plants usual discount will be allowed to the trade.

HUGH LOW & CO., Clapton Nursery, near London.

BASS AND BROWN'S SEED AND PLANT LIST, free by post for three penny stamps.

FLOWER SEEDS—BEST ASSORTMENTS, free by post.

The Catalogue gives colours, heights, months of flowering, hardiness, duration, and much descriptive information of time of sowing, and other treatment. *s. d.*

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of genuineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "*Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th of June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have increased so much that I must now cancel my former order, and beg you to supply me according to the list now furnished.*"

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of *Gardeners' Chronicle*, March 11.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

,, Hybrids, Gibbs' Green Top
,, Globes, Tankards, &c.
,, FARM SEEDS of all descriptions.

Priced Lists, Detail Catalogues, and other information can be obtained on application to THOMAS GIBBS & CO.

DAHLIAS.

JOHN KEYNES, in taking the present opportunity of expressing his acknowledgments to his kind friends for the favours conferred on him in past seasons, and in offering his Annual Catalogue for their inspection, trusts that the NEW FLOWERS recommended by him will continue to give that general satisfaction which it has been his pleasure to find has hitherto been so generally approved.

J. KEYNES feels great pleasure in being able to offer this season such NEW FLOWERS as cannot fail to be appreciated. His unrivalled success in obtaining First Class Certificates with them must be a sufficient proof of their excellence; and wherever he has exhibited them they have called down unprecedented approval; in fact, they are considered by the first judges to be the best Collection of New Flowers ever offered, and will, without question, remain Standard Flowers for many years.

FANNY KEYNES (KEYNES).—Light yellow, deeply edged with bright crimson, always full and close, compact eye, habit of Triumphant, and one of the most magnificent flowers ever offered; easy of growth, constant, quite up in the centre, every way the first of its class. 4 ft. 10*s*. 6*d*.

FIRST CLASS CERTIFICATES.

National ...	... 3 blooms	Salisbury ...	... 6 blooms
Hackney ...	... 6 ,,	Surrey Gardens	... 3 ,,
Norwich ...	... 3 ,,	Edinburgh ...	... 3 ,,
Brighton ...	... 6 ,,	North London	... 6 ,,

Was never shown without obtaining a first class certificate.

RACHEL RAWLINGS (KEYNES).—A pure peach, unrivalled form, exquisite flower, and whoever has seen it has acknowledged it to be one of the finest flowers they have ever beheld. 4 ft. 10*s*. 6*d*.

FIRST CLASS CERTIFICATES.

National ...	... 6 blooms	Salisbury ...	... 6 blooms
Hackney ...	... 6 ,,	Surrey Gardens	... 3 ,,
Norwich ...	... 3 ,,	Edinburgh ...	... 3 ,,
Brighton ...	... 6 ,,	North London	... 6 ,,

Was never shown without obtaining a first class certificate.

COL. BAKER (DODDS).—Clear light sulphur yellow. This flower was grown by Mr. Dodds, who has been the most successful raiser of Yellow Dahlias, having had the best ever sent out in their day, particularly Yellow Standard, which is even now at times unrivalled. J. KEYNES again offers the best yellow ever yet sent out in Col. Baker; very full, compact cushion eye, unrivalled symmetry, and constant. The smallness of the stock has been the reason of its not being oftener seen; but where it has been shown it has received unqualified praise. 4 ft. 10*s*. 6*d*.

FIRST CLASS CERTIFICATES.

National 3 blooms | North London 3 blooms | Salisbury 3 blooms.

Was never shown without obtaining a first class certificate.

MRS. RAWLINGS (RAWLINGS).—Blush white. The form of this flower is first-rate in every respect, the eye quite the summit, and the best blush without question, and a fit companion for Lilac King and Exquisite, which were sent out by the same grower last year. 3 ft. 10*s*. 6*d*.

FIRST CLASS CERTIFICATE—Brighton.

JOHN KEYNES (DODDS). Pale salmon. This is another gem of the season, and must be grown by all exhibitors. Requires no cutting out, and will make a noble back row flower; of exquisite symmetry, eye well up, and every way first-rate. 4 ft. 10*s*. 6*d*.

CERTIFICATE AT

National ...	... 6 blooms	North London	... 3 blooms
Brighton ...	... 6 ,,	Salisbury ...	...3 ,,

LADY BATHURST (BROWN).—This flower was raised by the grower of that unrivalled flower, Sir F. Bathurst; and J. KEYNES feels confident that its companion is equal in every respect to it. Colour, rosy purple. One of the finest flowers in cultivation. 4 ft. 10*s*. 6*d*.

PRIMROSE PERFECTION (KEYNES).—Pure bright primrose without shading, one of the most useful Dahlias ever offered; always producing fine blooms, and fit for any stand. Certificate at the National for its general good qualities. 5 ft. 10*s*. 6*d*.

FANCY FLOWERS.

With the exception of one first-class Flower, J. KEYNES has been so fortunate as to secure all the Fancy Flowers which have made way this year in obtaining Certificates, which alone is a sure test of their merit, particularly when they have been exhibited at Great Shows, and tested by the best judges in the kingdom. A flower may take a certificate at a little provincial show, but let it bear the test of the National and Metropolitan judgment, and if it obtains a first class certificate its success is sealed, and it comes out with confidence and honour. Scarcely one flower of J. KEYNES'S but has passed these tests, and been victorious.

LEADER (KEYNES).—Lilac, ticked and striped with maroon; finest stripe yet offered. 4 ft. 10*s*. 6*d*.

FIRST CLASS CERTIFICATES.

Salisbury ...	... 6 blooms	Hackney ...	... 6 blooms
National ...	... 3 ,,	Surrey Gardens	... 3 ,,
Brighton ...	... 6 ,,	North London	... 6 ,,

MARVEL (POPE).—Yellow, striped red. A most constant, useful, and beautiful flower, always to be depended on, and first class in every respect. 4 ft. 10*s*. 6*d*.

FIRST CLASS CERTIFICATES.

National ...	... 3 blooms	Slough ...	... 3 blooms
		Teddington ...	... 3 ,,
Surrey Gardens	... 3 ,,	Hackney ...	... 3 ,,
North London	... 3 ,,	South London	... 3 ,,

TOPSY (KEYNES).—Colour of Elegantissima, but infinitely superior; always to be depended on, and one of the finest fancy flowers in cultivation. White, edged and mottled with purple. 3 ft. 10*s*. 6*d*.

FIRST CLASS CERTIFICATES.

Salisbury ...	... 6 blooms	Hackney ...	... 6 blooms
Surrey Gardens	... 3 ,,	North London	... 3 ,,

UNCLE TOM (DODDS).—Red, tipped white; superior in constancy to Nancy; good eye, always full. 3 ft. 10*s*. 6*d*.

Fine Plants, as usual, in May, 1854, with plants to compensate for carriage.—Castle Street Nursery, Salisbury.

THE ELVETHAM MANGOLD WURZEL.—Having taken the precaution of supplying only half the quantities ordered (except in a few instances where small lots only were required), we have now a little Seed left for sale.

For the information of those who have not yet seen this superior new sort, we quote the following from among many other similar letters:—

From Col. Kingscote, Kingscote Park, Dec. 5, 1853.

"I could not wish for a better crop than I have of the Elvetham Long Red Mangold Wurzel; it succeeded with me far beyond what I could expect; the crop was a very heavy and even one, and far superior to either my Yellow or Red Globe."

From J. C. Sleman, Esq., West Cliff Cottage, Bideford, Dec. 5, 1853.

"I have had a most excellent crop of Mangold Wurzel from the Seed I had of you last April. I have had the Elvetham weighing 31 and 32lbs., and Yellow Globe upwards of 25 lbs. each."

From Charles Paget, Esq., Ruddington Grange.

"The difference was so great between the Elvetham and the other Long Red Mangold Wurzel that I should have preferred it at three times the price."

From Mr. Houghton, Steward to Lord Calthorpe.

"Elvetham Mangold Wurzel is the best we ever had; nothing else will go down here."

The crop of SEED having been short, the price this year is 2*s.* 6*d.* per lb. Yellow Globe and other sorts at lowest market prices, as Seed Catalogue. Orders will be executed in strict rotation.—Address,

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks.

TO DAHLIA GROWERS.—EDWIN HARRISON (PERRY'S), is the most brilliant crimson Dahlia ever raised; build and form of General Fauchier, and more constant than any crimson Dahlia in cultivation. No grower can be without it; as an ornamental plant it has no rival. It has obtained one first-class Certificate and three first Prizes as the best crimson Dahlia, beating all other varieties. Plants in May, 10*s.* 6*d.* each.

ALEXANDER POPE (PERRY'S), is a constant well-formed Dahlia, with very high centre; colour pale lemon. It has obtained one first-class Certificate and two first Prizes as the best yellow or buff Dahlia. The *Gardeners' Chronicle* says—"We like the flower much for its novelty." Plants in May, 7*s.* 6*d.*

Early orders are solicited, as the stock is small.—HENRY POPE, Gib Heath, near Birmingham.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

MITCHELL AND CO., having a large Stock of the following, are enabled to offer good, strong, healthy Plants at the annexed prices.

FUCHSIAS.—The following fine varieties of 1853, viz.: Alba multiflora, Belle of Barton, Beauty (Smith's), Collegian (Banks'), Duchess of Lancaster (Henderson's), England's Glory (Harrison's), Glory (Banks'), Incomparable, (Maple's), L'Elegant, Lady Franklin, Mrs. Patterson (Patterson), Miniata, Premier (Henderson's), Purple Perfection (Henderson's). The collection of 14 for 12*s.* 6*d.* A choice selection of older varieties—Agnes, Beauty of Deal, Cartoni, Crystal Fountain, Flavescens, Gem of the Season, Globosa Perfecta, Hendersoni, Nonsuch, Peculiarity, Princess, Purity, Resplendens, Splendidissima, the collection of 14 for 9*s.* Fine Mixed Bedding Varieties, 4*s.* per dozen.

PHLOXES of the choicest varieties, by name, 6*s.*, 9*s.*, 12*s.*, and 18*s.* per doz., strong plants.

Also their choice collection of TREE CARNATIONS, consisting of the most improved continental varieties, our own selection, by name, 9*s.*, 12*s.*, 16*s.*, 24*s.* per doz.

GERANIUMS of 1853.—Any 12 of the following choice varieties may be selected for 42*s.*; our own selection for 36*s.*; or the collection of 17 for 54*s.* Strong healthy plants in 48 size pots:—Dobson's Harriett, Jupiter, Spot, Vulcan; Hoyle's Attica Albinia, Butterfly, Kulla, Lagoma, Leonora, Novelty, Portia, Zaria; Foster's Eleanor, Optimum, Rachel, Queen of May.

CHOICE HELIOTROPES.—Gem, Madame Boucharlet, Souvenir de Liege, Voltaireanum nanum, 6*s.* per doz.; mixed varieties of ditto, 3*s.*

Goods carriage free, for orders not under 20*s.*, to all London terminuses, and to all stations on the London, Brighton, and South Coast Railway. Plants added gratis with all orders of 30*s.* and upwards. Post Office orders expected from unknown correspondents payable to MITCHELL & CO., or JOHN FAIRBROTHER, Brighton Post Office.

Bristol Nurseries, Kemptown, Brighton.

HONEYSUCKLE VERBENA.—So named for its delightful perfume, which is so near the odour of the Honeysuckle that it cannot be distinguished from it. Last season it was the constant inquiry of visitors at the Nursery Grounds if Honeysuckles were growing near, or what flower so much resembled them in fragrance, and on being informed it was the above new variety of Verbena, they were much surprised, and immediately ordered plants of it. Description—viz., compact habit, fine glossy foliage (will do excellently for bedding, or as a plant for pot culture), long stems to flowers, making it very useful for bouquets—blooms most abundantly; colour rich dark crimson, shaded lilac, very distinct eye; the truss of a fine globular shape, generally measuring 9 inches in circumference, all the pips fully expanded. It will force well during the winter, being a great advantage for cutting, or for its perfume in a greenhouse or conservatory at that season of the year; it will also stand the sun and rain during summer better than any other Verbena. A few blooms added to a bouquet will give it the scent of the sweetest Honeysuckle. Fine strong plants are now ready for sending out, at 5*s.* each.

LOBELIA LINDLEYANA.—The subscriber having purchased the whole stock of the above new Lobelia of Mr. Keynes, Salisbury, he begs to offer it to the public. It was awarded a Certificate of Merit at the Horticultural Society and National Society of London, June 1853. Description—viz.: Habit, dwarf and compact, flowering very freely, covering the whole surface of the plant; distinct in colour from all others yet out, being a bright rosy lilac. It is an excellent bedding variety, and will be sure to please every one who grows it, especially for its distinct colour and profusion of bloom. Strong plants now ready at 3*s.* 6*d.* each.

The usual allowance to the Trade when three plants of either are ordered. On receipt of a post-office order or penny postage stamps to the amount, the plant or plants will be sent postage and package free.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.—April 29.

TRUE ALSIKE CLOVER.

GENUINE NEW ALSIKE CLOVER SEED may now be had at 2*s.* per pound, and Common Clovers at 5*d.* to 9*d.* per pound, of JOHN SUTTON AND SONS, Seed Growers, Reading, Berks.

TURNIP SEEDS.

THE SUBSCRIBERS are now selling, from a large and carefully selected Stock, the following varieties of TURNIP SEEDS. Prices are moderate.

SWEDES.—Skirving's Purple Top. (*On strong clays or other heavy soils no variety of Swede will produce so bulky a crop as this.*)

,, Lothian Purple Top. (*An established well known sort, rounder shape than Skirving's, and does not grow so much to "long necks."*)

,, Hardy Green Crop. (*There is nothing to equal this variety for* mellow *and* peaty *soils. It is less liable to* rot *than any other Swede, and it possesses excellent feeding properties, being crisp, juicy, and sweet.*)

,, Laing's Improved. (*A beautiful shaped bulb, and on rich loamy soil yields a great crop, but is not equal in hardiness to any of the preceding.*)

YELLOWS.—Green Top, or Aberdeen Bullock—Improved Stock. (*It is questionable if there be a better Yellow Turnip than this, provided it be grown from a properly selected stock; it has, however, above all others, in too many instances, disappointed the farmer in consequence of the spurious character it has assumed through a bad stock of seed, which, instead of giving a heavy crop of large well shaped bulbs, with moderate sized tops, produce only stunted small bulbs with a profusion of large coarse tops.*)

,, Improved Purple Top Aberdeen—Skirving's variety. (*A very superior sort, yielding a heavy crop, but is not considered equal in hardiness to the preceding.*)

,, Dale's Hybrid. (*Yields a very heavy crop, and is a first-rate kind for early winter consumption. From the bulbs growing considerably above ground, it is well adapted for sheep-feeding.*)

,, Improved Early. (*A superior sort; bulbs large and finely shaped, with small top and tap root. Unless wanted for early use it should not be sown till the end of June, and sowing may be continued up to the middle of July, with the certainty of having a good crop.*)

WHITES.—Large Globe,

,, ,, Green Globe Imperial. (*A superior hardy sort.*)

,, ,, Red Globe.

Priced Lists of the above, with every other description of Farm Seeds, may be had on application, post free.

All parcels of Seeds are delivered carriage free to the principal Railway Stations and Shipping Ports throughout the kingdom.

W. DRUMMOND & SONS, Seedsmen, Stirling, N. B.

NEW DAHLIAS, ETC.

THOMAS BARNES begs most respectfully to announce that he is now prepared to send out fine healthy plants of the following, all of which will be found deserving a place in the most limited collections.

DAHLIAS.—Show Flowers; 10*s.* 6*d.* each.

INDISPENSABLE (BARNES).—Bright clear yellow; best ever offered.

JOHN W. HEDGE (BARNES).—Lilac and purple, distinct and fine; constant.

DANECROFT BEAUTY (BARNES).—Peach-tipped rose; fine shape and centre.

NEW CONTINENTAL VARIETIES.

EVA.—Pure white shaded peach.

LE DIVAN.—Scarlet and maroon shaded.

LE GRAND SULTAN.—Black crimson, shaded rose.

MENTOR.—Lilac, with metallic shade.

OMER PASHA AMARANTH.—Red bluish shade.

GOSSIP (Fancy).—Delicate lilac, white tips; 7*s.* 6*d.*

All the leading varieties of last season, 24*s.* per dozen.

Older sorts of approved merit, 9*s.* per dozen

Six new seedling PETUNIAS, 3*s.* 6*d.* each, or 18*s.* the set.

Three new seedling VERBENAS, 12*s.* the set.

20 Continental varieties of VERBENA, quite new, 2*s.* 6*d.* each, or 24*s.* per dozen. Descriptive Catalogues on application.

Danecroft Nurseries, Stowmarket.

MESSRS. J. AND H. BROWN offer the following SELECTED PLANTS, &c., which they will forward to any part of the Kingdom.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	May	1—Horticultural (Anniversary)	1 P.M.
TUESDAY,	—	2—Linnean	8 P.M.
FRIDAY,	—	5—Botanical	8 P.M.
SATURDAY,	—	6—Royal Botanic	3 P.M.

COUNTRY SHOWS FOR THE MONTH OF MAY.—3d: Cheltenham.—15th: Hammersmith Pansy.—18th and 19th: Exeter.—23d: Handsworth and Lozells.—24th: Nottingham and Colchester.—25th: Derby.—26th: Bury St. Edmunds.—29th: Hunslet.—30th: Truro.

IT is to be feared that all round London the hopes of the gardener have been destroyed by a sudden and most SEVERE FROST on the night of the 24th inst. From the 18th to the 20th the weather was excessively hot for the period of the season, the thermometer indicating 77° in the shade on the 19th; and as high as 95° in the sun on the 21st. A strong gale commenced from north-east on the night of the 22d, and continued on the 23d, on the night of which there was 1° of frost; but the blossoms were safe. On the evening of the 24th there was 1° of frost at 10 P.M.; but during the night the thermometer fell to 18°—or 14° below freezing, notwithstanding the heat arising from the ground. Where this heat was prevented from affecting the thermometer by a radiator, the temperature of the air was as low as 12°.

The frost was what is termed a black frost, of the most pervading description. Apple, Pear, Plum, and Cherry blossoms are everywhere killed. There may be a few from later blossoms, and a few naturally late-blooming Apples, but all the most valuable are completely destroyed. Peaches and Nectarines on a good south wall have suffered, but such of the young fruit as were leaning against the warm wall are supposed to be safe. The shoots of Walnuts are hanging wet, black, and soft, as if parboiled.

There is no record of the thermometer having been

thus low in April, near London, in the present century at least.

Accounts from the surrounding counties are to the same effect. Near Tunbridge Weils the thermometer fell to 25°, and the most abundant young crop of Apricots, Peaches, and Pears which had been seen for several years was entirely destroyed. In Hampshire, near the Andover Road Station, betwixt 4 and 5 o'clock, the thermometer was 14° below the freezing point. The whole of the blooms on the Cherries, Pears, Plums, and Apples totally perished; also the young Apricots, which were larger than Damsons, and all the Greengage Plums, as well as Rhubarb, and every Asparagus head which was above ground. Such destruction had never before been seen by our correspondent.

At Sawbridgeworth, although Mr. Rivers observed the thermometer no lower than 25°, all the wall fruit which was not well covered, all the standard Pear, Plum, and Cherry blossoms, and the greater part of the Apples, if not all, utterly perished.

Near Worthing the common Box lost nearly all its *old* leaves; our informant assures us that he found the inside of them a solid plate of ice.

Next week we shall no doubt have abundant confirmation of this sad announcement.

Having lately called attention to the resources which we possess for paper making in our very weeds, some of which will grow well in our most barren soils, we return to the subject, to show that our colonies also possess abundant stores of similar material, but which are at present allowed to run to waste. This may appear an unimportant subject to some, for they hastily conclude that there must always be plenty of rags for all that is required; but if each educated person will consider the quantity of paper which he himself makes use of for writing, for packing, or for the periodicals and books which he purchases, and place against it the quantity of linen or of calico which he wears out in the year, he will readily admit that the latter quantity comes far short of the former. Every tradesman, moreover, wants much for the details of his business, while even the poor man has his cheap periodical and his share in a newspaper. In addition to this, the consumption is expected greatly to increase whenever the duty on paper is taken off, as being "a tax on knowledge."

Notwithstanding the enormous consumption, there is no doubt that this is susceptible of still greater extension, for even in a country like China, as we have been informed by an excellent observer, only those who have resided in that peculiar country can be aware of the very extensive uses to which paper is applied, or of its varieties, from the thin and bibulous ordinary paper and the coarse heavy half-inch-thick touch-paper, for retaining a slow enduring fire, to the beautiful Indian (or rather Chinese) paper, suited for our finest proof engravings. He moreover adduces the tea-chests, as showing the great economy of wood, and the lavish use of many thicknesses of paper coating its sides and greatly strengthening them. Again, in a leaky hut or boat, the bed is protected over-head by a very large sheet of oiled paper, so slanted that the rain shoots clean off the sleeper; or, does a shopkeeper want to tie up your parcel, he seizes a strip of tough paper, and by rolling it on his thigh, at once converts it into a strong pack-thread. Even patches on a torn boat's sail are, at times, made of tough paper. It is the cheapest of materials in daily use, and the manufactories are very numerous and simple in machinery, being situated on the banks of their rivers, of which the water is soft and well adapted for the purpose.

We do not adduce these various applications as susceptible of adoption in this country, but to show that, if the Chinese can, by making use of common materials, produce paper at so cheap a rate, the same thing may be done in other countries, by adopting the same methods—that is, by making use of the common plants of their country, and of which every country produces a great abundance, similar in nature, and applicable to the same purposes. Thus, Rice-straw is the substance most commonly used for their wrapping paper. The young shoots of the Bamboo, macerated in water, and then pounded in mortars, is another common material. The refuse of the various fibrous plants, and the inner bark of the Morus, now Broussonetia papyrifera; Indian gunny bags, which are usually made of Jute or Corchorus olitorius; and also cotton and silk refuse rags are all converted into paper. No doubt, the peculiar properties of the paper are due to the materials from which it has been made, as the thin and bibulous from Rice straw, and the fine and tough probably from the Broussonetia. So in India, another anciently civilised country, and where the manufacture has long been known, we have paper made from cotton, from the fibrous materials obtained from Malvaceous and Tiliaceous, as also from Leguminous plants; while in the Himalayas, immense sheets of very tough paper are made from the inner bark of Daphne cannabina.

Having adduced the above facts, on account of the inference to be drawn from them, we may, in addition to our former article pointing out the numerous plants in Europe, belonging to the very same families as many of the above, direct attention to the still more numerous plants in our colonies, equally applicable to the very same purposes, and which, now growing in rank luxuriance, are yearly burnt down, or are allowed to rot without enriching the fields where they have been grown. Though we may not, like Schaffers, look upon the world as "one vast mass of latent material for paper," yet it will not be difficult to point out, as we shall do in a future article, a number of plants which are at present grown profitably for other purposes, and of which the stems are capable of yielding materials for paper making, and which are at present made no use of—not even, as we have stated, for manuring the soil. We believe it would be quite as economical to collect some of these fibres for the express purpose of paper making, as to rake rags together from every hole and corner, and which, after all, are not very cheap, and take some trouble in sorting, in cutting and cleaning, as well as in bleaching, before they can be reduced to pulp fit for the use of the paper-maker.

We have now before us good writing paper prepared from deal shavings by Messrs. Watt & Burgess, under a patent they have taken out. By some unexplained process the pulp is prepared in such a condition that it may be immediately made into paper in a common paper mill.

Another correspondent, whose letter will be found in a neighbouring column, transmits from Ireland the fibre of Gorse, which seems to be so well suited to the same purpose that an eminent paper maker, to whom we have submitted it, values it at from 8*l.* to 12*l.* a ton. And a material, inferior, indeed, but reported to be most abundant near Ballina, in Ireland, and suited to common purposes, has been placed in our hands by Mr. Billington. It therefore seems clear that we have only to exert ourselves a little, in order to overcome the difficulty which at present threatens to extinguish every low-priced periodical in the kingdom.

It is announced that the Natural History Society of Athens, alarmed at the progress made in Greece by the Vine Disease, has invited communications upon the subject, for the best of which a gold medal is offered, value 400 drachmas, with the head of King Otho on one side, and the name of the author on the other. We suspect that in this country candidates would prefer the medal without his Majesty's bust upon it. The treatises may be written in Greek, Latin, Italian, French or German, and must be delivered to the Secretary, at Athens, upon the 13th January, 1855.

We believe the drachma is worth 9*d.*; so that the person who shall succeed in relieving Greece from the pest which is annihilating an important part of its produce, will be rewarded with the munificent prize of fifteen pounds sterling, or what, on the honour of a Greek, is equal to it. We hope the likeness of King Otho does not form part of the value.

VEGETABLE PATHOLOGY.—No. XVII.

71. Besides the normal buds, adventitious buds occur on various parts of plants, as on the stem and ligneous roots, when the tree has been severely pruned or lopped, or even under ordinary circumstances in such plants as have a peculiar tendency to their production. Such buds may be either truly adventitious—produced, that is, entirely independently of the normal arrangement of the leaves; or truly latent—that is, formed one or more years previously, but never before fully developed.

72. Buds exist in the axils of all leaves, at least of exogens; but besides these axillary buds, lateral buds often exist at the base of the former, which do not seem referable to any bracteæ.

73. Adventitious buds, like their analogous roots, arise in most cases from the vascular tissue of the wood. Their base, according to the observations of Trécul, is first formed before there is any trace of stem, and the first traces of vascular tissue occur in this part frequently before the appearance of any leaves; the true tracheæ are not formed till a later period, but reticulated vessels, which are soon transformed into dotted vessels* where adventitious buds occur in other situations, as in the bark, leaves, &c., they are probably always in connection with vascular tissue.

74. A curious form of latent buds often occurs in the bark of trees, called embryo buds, knaurs, &c., on the origin of which much light has been thrown very lately by Trécul. Perfectly independent woody nodules are thus formed in the bark, which increase by the additional or external concentric layers, a fact which is most strongly opposed to the notion of woody tissue being due to roots descending from buds. As these nodules present a peculiar form of disease, they will be more particularly considered in some future division of this treatise.

75. Every leaf bud contains in itself all that is needful for the reproduction of the tree; and, therefore, provided its life can be preserved unimpaired for a sufficient time, either to allow of the formation of adventitious roots to imbibe the necessary moisture, or for adhesion to take place between its surrounding tissue and that of the plant on which it may be inserted; provided also the nature of the plant on which it is inserted be congenial to its constitution, development will take place, and all the peculiarities of the parent plant, in some instances, however slightly modified, will be presented by the young shoot. On this depends the success of the various modes of budding and grafting practised by gardeners, and of the rearing of trees by cuttings, for the protection of the severed tissue of which from external agents a solution of gun cotton in ether has lately been used with much advantage.* Propagation has also been effected by the insertion of a portion of bark; but when this is the case, the new shoots must arise either from a latent or adventitious bud.

76. Buds either contain in themselves a store of nutriment, ready for use on their first development in spring, or are in close connection with such a supply. In some cases, as in the aerial bulbs of Lilium bulbiferum, and several species of Allium and Dentaria, these component leaves are transformed into thick scales, abounding in nutriment, and the whole readily becomes detached, forming a prolific and speedy mode of reproduction. True bulbs, whether central or lateral, differ in nothing except in size. In speaking of roots, the true nature of tubers, corms, &c., was indicated, the exact distinction of which is of great importance in descriptive botany. The large spongy bodies which occur in the capsules of some species of Crinum and allied genera, though possessing no evident imbricated structure, may be considered as a sort of buds.†

77. In many bulbous plants, whether truly bulbous or exhibiting bulb-like modifications of the axis, stem, &c., the buds may be traced which are destined to propagate the plant after a lapse of one, two, or even three years.‡ Numerous instances will be found in the work Irmisch on Bulbs and Tubers, to which attention has already been directed. *M. J. B.*

---

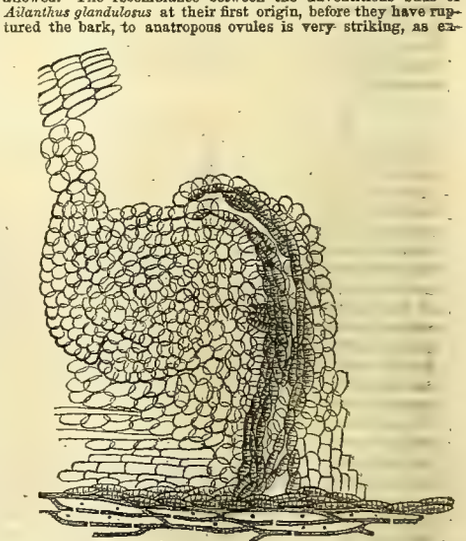
* See Trécul's Memoir on the Origin of Adventitious Buds. Annales des Sciences Naturelles, November, 1847.

EUPHORBIA JACQUINIFLORA.

When seen in the form of moderately well-grown specimens, covered with brilliant scarlet flowers, few plants have a more striking appearance than this, and perhaps there is not another of equal beauty in cultivation whose flowers remain so long in perfection. Unfortunately this species is of a straggling habit, and it is not easily induced to form anything like a handsome specimen, but it is a free grower and by no means delicate, and, with proper attention to stopping, &c., fair specimens may be obtained at no great expense of time or attention.

* The solution may be preserved in a fluid state, by keeping it in a bottle and inverted in water. There can be no doubt that when it can be obtained at a reasonable price it will prove a valuable acquisition to the cultivator and physiologist, wherever it is requisite to prevent the access of external air or moisture.

† The analogy between buds and ovules is pretty generally allowed. The resemblance between the adventitious buds of *Ailanthus glandulosus* at their first origin, before they have ruptured the bark, to anatropous ovules is very striking, as exhibited in the annexed woodcut from Trécul, which is at the same time illustrative of the mode of formation of adventitious buds in general.



‡ A great deal of very interesting information on the endurance of buds in trees, or of the power of producing new buds, in trunks which have been removed for many years from the soil, will be found in a paper by M. Pepin in "Annales des Sciences Naturelles," sér. 2, vol. 15, p. 269. A curious instance is afforded by the dormant condition of the roots of some Orchids, where circumstances are not favourable for their development. Certain species appear constantly in particular woods for a year or two after the copse has been cut, but are not seen again, though carefully sought for, till the rotation of the clearing of the underwood returns; and this not only in the case of such species as the Fly and Bee Orchis, but of varieties of Epipactis.

Propagation is easily effected by cuttings, either of the young wood in a moderately firm state, or of the shoots after flowering, and strong pieces of the roots answer equally well. The cuttings should be planted in thoroughly drained pots or pans, in sandy peaty soil, covered with a bell-glass, and placed in a mild bottom heat, taking care, in the case of cuttings of the young wood or roots, not to give too much water; and those made of the points of the flowering shoots will be more certain to root, if allowed to stand for a month in a shady part of a moderately warm house before placing them in bottom-heat. When the cuttings are fairly rooted, pot them singly in small pots, and place them in a shady part of a pit, where a warm humid temperature is maintained, until they become well established, after which they must be kept near the glass and freely exposed to light, to prevent long-jointed weakly growth. As soon as the young shoots are a few inches long, and sufficiently firm to bear handling, bend them carefully, so as to check the flow of the sap to the points, and when the lower buds become prominent pinch out the points; for very little will be gained by stopping unless means are used to get the lower buds prominent before this is done, and this must be attended to if anything like dwarf well furnished specimens are expected, and all the principal shoots on a plant should be stopped at the same time. During the growing season the plants should be afforded plenty of pot room, and a temperature of 60° to 70° at night, allowing it to rise 10° or 15° with sun-heat; and the atmosphere should be kept moist, syringing the plants over-head morning and evening. A slight shade for a few hours on the forenoons of bright days will also be beneficial, but this should be used very sparingly. Flowers will not be produced freely unless the young wood is well matured; therefore, plants intended for blooming should not be stopped later than the beginning of August, otherwise, in most cases, it will be difficult to get the wood properly ripened; but this will be best regulated by circumstances. Towards the middle of October, or as soon as the plants have made shoots from 18 inches to 2 feet long, they should be removed to a cooler, drier atmosphere, giving water sparingly at the root, which will check their tendency to growth, and greatly assist in ripening the wood. By removing them to a somewhat moist growing temperature, and giving a proper supply of water to the soil, flowers will soon be produced from the axil of every leaf on the properly matured wood. And while in bloom the plants may be placed in the conservatory, where, if the temperature averages from 45° to 50°, they will remain in perfection some two months.

After flowering, remove the plants to any spare corner in a house where the temperature may range from 50° to 55° by fire heat, and let the soil become quite dry, when the shoots should be tied out and cut back, in order to induce as many buds as possible to break into growth. When growth has fairly commenced the plants should be repotted, or large old specimens may have their balls reduced, repotting them in smaller sized pots, and placing them in a brisk growing temperature, to induce a free root action. If proper attention is paid to tying down and cutting back the shoots, there will be no necessity in the case of old plants for stopping more than once after growth has commenced, and the specimens should not be kept in so warm a temperature as recommended for young plants.

The soil for this plant should be rich and thoroughly porous, so as not to be liable to become water-logged. Leaf soil, turfy sandy loam, and fibry peat, carefully broken up and well intermixed with plenty of sharp clean sand and small bits of charcoal, will be found to answer perfectly. *Alpha.*

Home Correspondence.

Gorse Fibre, a Material for Paper Making.—I have sent you a specimen of the fibre of the spines of Gorse (Ulex Europæus), which appears sufficiently strong and white to be used by itself alone as a material for paper making. Some of the crushed Gorse was taken, which I am in the habit of using largely, for horse food. This was well mashed in water with a pestle till all soluble matter separated. When so treated, the fibre becomes of the degree of whiteness which the specimen exhibits, without chemical bleaching. About 50 per cent. of the green Gorse appears to be water, and about 25 per cent. soluble matter, in which its feeding properties mainly reside, and 25 per cent. woody fibre. In the process of mashing under water, some of this fibre was lost, but 17 per cent. of the whole weight of the fresh cut Gorse was obtained. I find that I cut about 12 tons of Gorse per statute acre annually on light and deep, but otherwise poor, soil; so that a net yield of 2 tons of fibre per acre might be obtained. It would possibly be worth while so to arrange the process as to preserve and use the solution for moistening dry food for sheep and cattle. I do not know what value the paper makers would set on such fibre, but looking to the cost of waste cotton, I should think the value of 2 tons of it per acre ought to pay. Growing so well as it does on a large extent of land, little suited for other crops, and with so little expense and trouble attending it, it would form a cheap and abundant supply of raw material for one of the prime necessaries of advanced civilisation. The fibre forming the bark of the spines seems to possess more tenacity than the fibre of wood and straw. The wood in the interior of the spine is weak, and it is this part, I apprehend, which wastes so much in the mashing. The Ulex nanus, which covers the hills on this side of Ireland, affords a precisely similar fibre. I apprehend that the best mode of treatment would be to crush the Gorse when first cut, as now practised for cattle feeding, then to pass it through a paper maker's stuff engine till it is reduced to a pulp, afterwards to express the soluble matter (using it if possible for feeding purposes), and finally, wash it in several waters. The whole process should be completed before fermentation sets in, otherwise the fibre will be discoloured. An immediately available supply of both kinds of Gorse is to be found all through the western counties of Ireland, together with much unused water-power, which might be employed in bruising and mashing, so that the question of its successful and economical employment seems worth the serious attention of the paper-makers. *B. Blackburn, Valentia, Kerry, April* 19. [There is some little doubt on the part of paper-makers whether this article contains fibre enough to be a first-class paper-material. It is probably worth from 8*l.* to 12*l.* a ton at least, delivered; if better than is expected it will be worth more. We can find a customer for half a ton for trial.]

Dr. Hooker's Himalayan Journals.—Many of your readers, I should expect, have, like myself, been deeply interested with these delightful books, which appear to open to us a new world of botany, and it seems to me that a new interest will be created, if we can learn, through your volumes, whether the following trees and plants have been, or are likely to be, introduced to our gardens:—Magnolias excelsa and Campbelli; the large Fig mentioned in page 157, vol. i.; Talauma Hodgsoni, p. 162, vol. i.; the yellow Bramble; the scarlet (leaved) Berberry, and yellow Rose, p. 211, vol. i.; Primula petiolaris, p. 306, vol. i.; Hodgsonia, p. 7, vol. ii.—this must be a most unique plant; the yellow Raspberry, p. 19, vol. ii. What a magnificent tree must Juniperus recurva form, as given in vol. ii., p. 28! in England it does not seem to have sufficient vigour to form a tree; and then, again, have we Gonghia, "a large and handsome evergreen," and the Black Juniper; the Magnolia "with globular sweet-scented flowers like snow-balls; the lovely yellow, purple, pink, and white Primroses," as described p. 45, vol. ii.; and then, only think of yellow Cowslips 3 feet high! p. 58, vol. ii. I hope Dr. H. brought or sent over seeds of this fine plant. The Alpine Strawberry, with oblong fruit, p. 108, vol. ii., must be interesting. The blue climbing Gentian, Gentiana Crawfordia, p. 145, vol. ii., must be a charming plant; and the "magnificent (evergreen) tree" Bucklandia, p. 185, vol. ii., is I hope growing at Kew; these are only a few—very few—of the highly interesting plants and trees alluded to and described in Dr. Hooker's pleasant pages. If you can give a little information as to the introduction of the above, or if likely to be introduced, I am quite sure you will much gratify a great number of your readers. The Sikkim Rhododendrons are beautiful things; I have at this moment a plant of R. Edgworthi, about 1 foot high, in a 6-inch pot, with a large cluster of its highly fragrant flowers in full bloom; they are white, and nearly 4 inches in diameter. What a remarkable un-Rhododendron-like plant it is! *T. R.*

Mildewed Strawberries.—I am confident that with care the mildew on Strawberries can be prevented. When I came here, on the 15th of February, I found 100 pots of Black Prince and Roseberry just coming into bloom; the greater part of these was standing on a shelf at the back of the stove, in feeders with a little charcoal in them, and some at the front without feeders. Nearly all those at the back were white with mildew, while those at the front were clear, both Black Prince and Roseberry. The cause of those at the back becoming mildewed was evidently their standing in stagnant water, and their having got less air than those in front, which were also altogether drier. I threw the greater part of the back ones away, and took those from the front and put them in their places, as I wanted the front for Roses, but, instead of placing them in feeders with charcoal as before, I took other pots the same size as they were in, put in them sufficient soil for each pot to rest firmly on, and then placed them on the feeders without charcoal, as I could not dispense with feeders, in consequence of the drip falling on some plants underneath them. Whenever I watered them I took care to go over them again, and empty the feeders of water and apply sulphur to those which appeared a little infected, and I found it to answer well. I gave plenty of air night and day, kept a drier atmosphere, and by these means I met with every success. I gathered good fruit in the middle of March, and I have no doubt that any one using the same precautions will meet with similar success. *R. F., gr. to H. Wormald, Esq., Sawley Hall, Ripon, Yorkshire.*

Rain Gauges.—Is it not probable that although Mr. Lawes found that the weight of the water collected by the large gauge was 6708 lbs., which, reduced to measure in depth, was equal to 5¼ inches more than fell in the ordinary gauge; yet some considerable portion of the excess may be owing, not to actual fall of rain, but to a deposition of moisture caused by the large body of metal necessarily required in the construction of a vessel covering an area equal to the 1-1000th part of an acre. All the moisture deposited in the 99 days in which no rain had fallen in the ordinary gauge, I presume must be accounted for in this way. Air that appears quite transparent, nevertheless contains moisture under ordinary circumstances, and this moisture is being continually deposited on the surfaces of bodies that are colder than the air in contact with them; it is deposited by a few degrees of cold when the air is nearly saturated with moisture; and if there is but little moisture a greater degree of cold is required to produce condensation. Now, as the temperature at night was lowering, the metal of the gauge would be warmer, and no deposition would take place upon its surface from condensation. But, when the temperature of the air rises from its minimum point, and becomes warmer than the metal, condensation will ensue, especially in the morning, when the air is saturated, or nearly so. In this way, more moisture would be accumulated in the metal receiver than on an equal area of the surface of the earth, for the latter would not become so cold. It may be said that a small gauge, being also composed of metal, would equally condense moisture in proportion to its size; but the small gauge requires to be made of only a thin sheet of metal, the heating and cooling of which nearly keeps pace with the changes of temperature of the air. In employing large rain gauges, it would be desirable to distinguish, as far as possible, the amount of rain from that which may be due to the condensation of moisture. *Robert Thompson.*

The self-adjusting Patent Scythe.—When this invention was first made known, I hailed it as a great boon to those who, like myself, have a good deal of Grass to keep in nice order, and that so varied in surface as to render the mowing machine inapplicable. I ordered some of these scythes, and at once appreciated the saving in men's time and blacksmiths' bills for laying them; to which must be added the advantage of one handle wearing out a number of blades, its iron heel obviating the decay to which the wood on the old plan was subject. The first set of blades which I had, having been worn out while the handles are in all respects perfect, I desired our ironmonger to procure more blades, but, to my dismay, am now told that the patentees will not sell one part without the other. The promised advantages therefore amount to *nil;* and the old plan must be adopted, unless every large establishment adds to its other requirements a repository for old scythe handles. *Henry Bailey, Nuneham, Oxford.* [Surely, the patentees cannot seriously intend to practise thus upon the public. If they do, it will be better to return to the old scythes.]

Protection of Wall Trees.—May I ask some of your correspondents to give me their experience as to placing shallow vessels of water in the near neighbourhood of wall-trees as a protection from frost?—and, if successful, can a reason be rendered?—or for the contrary? *J. P. Sampson, Chesterford, near Saffron Walden.*

Musch Musch Apricot, and Nerii and Pregussata Figs.—May I ask what experience has been had as to the bearing qualities of the Musch Musch Apricot, the Nerii Fig, and the Pregussata? The Musch Musch I have tried without success, both on the wall and in the orchard-house. Judging from the place it comes from, viz., the very hottest portions of the temperate zone, where it grows side by side with the Date Palm, one would not, *à priori*, suppose it likely to succeed well in latitude 52°. As to the Nerii Fig, in an excellent article which appeared in the *Chronicle*, April 13, 1844, Mr. Markham states that the superiority of this variety, even against an open wall, was so great as to induce him to discard all others. Now, though it has fruited with me, I find it a very bad bearer, both on the wall, in a cool Vinery, and in an orchard-house. The Pregussata Fig is generally recommended in short select lists; but a potted plant I have has never, during four years, shown a single fruit either of first or second crop, though other varieties similarly treated have borne well. I really believe, that, taking all qualities into consideration, nothing equals the Brown Turkey. *C. M.* [In favourable seasons, or even in such as were formerly reckoned ordinary ones, the Musch Musch Apricot bore very well. In the Royal Gardens, Frogmore, some fine trees of it bear abundantly. The Nerii Fig was successfully cultivated by Mr. Knight, and the following extract from what he states respecting it in the Transactions of the Horticultural Society, Second Series, vol. 2, p. 165, may prove useful:—"I have made, during several successive years, attempts to ripen the Nerii Fig, which is one of the best, if not the best, of the Figs of Italy; and I have ultimately succeeded; and as the mode of management which I have adopted is peculiar only, and not difficult or expensive, and nearly similar to that under which the Peach and Nectarine will be found to acquire the highest state of perfection, I have thought the following account of it worth communicating:—I begin to heat the house in the middle of February, and continue the fire till the fruit has acquired its first swelling in May. If artificial heat be still applied, the first formed fruit will fall off, and will be succeeded by other fruit, which will also fall off abortively. The fruit, therefore, after it has acquired its first swelling, is subjected to the influence of confined solar heat only, till it begins to acquire maturity. Much air is then given, and if the weather be not dry and bright, artificial heat is, to a small extent, again employed to prevent the mature fruit from becoming mouldy; and I believe, upon the evidence of many friends, who are well acquainted with the merits of that fruit in different southern climates, that it is rarely seen in a higher state of perfection than when ripened in the manner above described. I have succeeded in ripening the Nerii Fig in a very considerable state of perfection, by introducing the trees in pots against the back wall of a stove in February, and removing them to a greenhouse, out of which the plants had been taken, in the middle of May. Almost all the spring fruit of my Nerii Fig trees has fallen off

immature, and none of it has ever ripened properly; and I doubt whether its spring fruit ever possesses much merit in any climate." The Pregussata Fig is considered a good bearer, but we agree with you that none exceeds the Brown Turkey, which is the best for general cultivation, as regards sure bearing.]

Substitute for Frames.—As some of your readers, like myself, may not be well supplied with frames for growing half-hardy plants, allow me to mention my plan, which may be worthy of notice. Take any old tub or box, put into it the stones and rubbish, weeds, &c., that accumulate in small gardens, then fill the vessel to within 2 inches of the top with good mould, adding plenty of sharp sand; then nail wires across the top at such distances as will suit any old pieces of glass you may have, making up with squares 6 in. by 4 in., which can be bought of the glassman at 4*d.* per dozen, 2*d.* per foot superficial. The glass is placed side by side on the wires, and covers the box or tub sufficiently to bring forward flower-seeds, Beans, &c., which require to be cared for in April and May; and when of the proper size are easily drawn up for transplanting into the open ground, where they are intended to flower. When this use is ended, the mould is applied to good purpose, and these tubs or boxes make good receptacles for weeds, &c., placed in some out-of-the-way corner for the next season, when the weeds and rubbish will have become good mould. *T. B. L.*

Cookery.—I am glad to find you seconding Lord Ashburton's most sensible advocacy of the study of "common things," especially among the poor, by your article upon diet, in a late *Chronicle*. It was, I believe, the custom at Edinburgh, not very long ago, and I believe it still prevails to some extent, for ladies of rank to receive lessons from some Maitresse de Cuisine, such as Mrs. Glasse, Mrs. Rundell, &c., in the art of cookery, and perhaps the manner in which our sisterhood over the border surpass us in the manufacture of marmalade, and other preserves and confectionery, may in a great measure be attributed to such instruction. At any rate, for the mistress of a family to be practically acquainted to a certain extent with such an art is an advantage which the master of a family will very speedily find out and very fully appreciate. The immense saving in butchers' bills which was to be effected by the lady's knowing what can be done with the odd scraps of meat, fish, vegetables, &c., and not trusting entirely to her cook's ideas of economy, will be incalculable, to say nothing of the increased wholesomeness which good cooking may bring to the food, and the agreeable variety which may be made in the dishes. How many things are used in other countries as food which we neglect in our island? And many a dish which the English smack their lips over at "Very's" or "Les Trois Freres," as a rare delicacy, upon analysis may be found to contain the simplest and in England the most neglected ingredients, but thrown together by the artistic hand of a skilful Parisian *cuisiniere*. A friend of mine, a very able barrister, used to study cookery as a science; and among how many families would the knowledge of a little domestic economy be more serviceable than the exclusive study of music and all the accomplishments! Why should not the art be practically taught in our ladies' schools? and in simpler terms in our national schools? What an invaluable rarity is a good cook! What a treasure a wife of peasant, or one higher still, who knows how to have a warm wholesome dinner provided for her husband and children's return from school or work! What contentment does it bring! and how much comfort, soberness, health, and good feeling will it engender! I say, with all instruction among rich and poor, let a knowledge of common things be imparted. I have seen the lack of it among the most learned cause the greatest discomfort, confusion, and trouble; and I could tell you an amusing and rather appropriate anecdote, but I am afraid I have trespassed too long. I feel in myself that I cannot scold my groom properly as to the management of my horse, because, though I see he is not quite right in his stable work, I do not exactly know where he is wrong, as he is always ready with an answer, and my ignorance will soon display itself. (The late King of Holland, it is said, had his sons taught to groom their horses and make their own beds, and he did wisely.) So with my gardener, &c, though a very little in early life would have taught me, and taught them too. I heard once of a valuable workman in a manufactory, who, getting into bad company, ruined himself and his domestic comfort by drinking. His master, to his honour, determined to try and reclaim him; he, therefore, agreed with him not to pay him his wages in money, but to provide for him so much bacon, so much bread, beer, &c., as was necessary for himself and family for every day, and any surplus was put by in the savings' bank. Before the year was out he had his reward; the man found the blessing of soberness and saving. I think there was a list of the articles provided per day, and their cost, published. And would it not be of immense advantage to the labourer, if you could point out how he could most economically lay out his 10*s.*, 12*s.*, or 15*s.* per week? How he might club with his neighbours for bacon, flour, &c.? A few hints of the sort would surely be of great benefit, and teach them how far better good pork and bread is than bad gin and water—the decent cottage fireside and garden, than the riotous, extravagant, and ruining tap-room and settle. *Northwood.*

Ornamental Forest Shrubs of North America.—In my rambles, which extended from the Lower Province of Canada to Carolina, I visited all the principal towns in the Upper Province, three of the great lakes, viz., Ontario, Erie, and Huron, and the far-famed Falls of Niagara. To botany, however, I paid most attention; and reading in public prints of the rapid progress now making towards the completion of the Crystal Palace, has suggested to my mind the scope that will be there afforded for the development of the trees and plants of tropical and other climes, and which we can only expect to witness in this country in such places as the "Palace of Glass," where they can grow and exhibit their beauties in perfection. I am aware that a great proportion of the trees and plants of North America will survive out of doors in this country, but still the absence of their native summer heat prevents them from arriving at anything like perfection with us. Plants of at least three genera, which I shall name, would certainly be greatly improved by being transferred to the palace at Sydenham. I had no idea that the first of these was the beautiful plant which I found it to be, till I saw it in its native climate; I allude to an old inhabitant of our greenhouses — Gelsemium nitidum, Bignonia sempervirens of Willdenow. For forming an arbour, I know of no evergreen twining plant to compare with this Bignonia; its beautiful shining lanceolate leaves, and profusion of large fragrant yellow blossoms, making it an object truly desirable. When I met with it first in gardens in Virginia, growing in all its native luxuriance, it was difficult to believe it to be the same species as that represented by the poor puny specimens of it to be found in this country. Probably Rhododendron maximum var. purpureum of Pursh, would succeed well in this country, if placed under the protection of the crystal roof at Sydenham. I know not to what size R. arboreum attains in its native country, but I feel assured it would be interesting to many to have the two exhibited together, by way of contrast. Pursh describes R. maximum purpureum as growing to an immense size:—"Its stem is often found 18 inches and more in diameter, and its foliage triple the size of that of any other species." There are splendid groves of them in western Virginia; the first I met with in that State was of large extent, it must have covered many acres of a mountain valley; they were mixed with the broad-leaved Kalmia; I do not recollect any deciduous trees of the neighbouring forest being amongst them. It was November when I passed through the "Shades of Death," so named by the settlers in that part of the State, their deep gloom forming a curious contrast with the forest around, the trees of which were divested of their leaves. Many of them were certainly upwards of 20 feet in height, and 10 or 12 inches in diameter. Deep, however, as the gloom of their shade certainly was, I believe all the known species of Pyrola grew there in great luxuriance. Maculata and corymbosa were abundant. It is a fact, which I considered somewhat remarkable, that during a journey of 600 miles there was not a plant of Rhododendron met with, except at that place. The only other evergreen trees (with the exception of Coniferæ) were a few good specimens of Ilex opaca. The summits of the Alleghanies, where I passed, were thickly covered with Kalmia latifolia of low growth, mixed with a few scrubby Oaks. Of the beauty of Magnolias, we can form no conception from the specimens that exist in this country; and therefore, an excellent opportunity is now presented (which, no doubt, Sir Joseph Paxton will take advantage of) of having the eight American species, with their varieties, transferred to Sydenham, where an artificial summer heat might be supplied, somewhat resembling that of their native climates, and where they would also have scope enough for full development. I was not aware, till I visited Virginia, that M. glauca is invariably found in wet marshy ground, similar to that in which our Alders love to grow. *T. B.*

Societies.

LINNEAN, *April* 18.—WM. YARRELL, Esq., V.P., in the chair. C. S. Spence, Esq., and J. Byerley, Esq., were elected Fellows. Mr. J. D. Salmon exhibited fresh specimens of Lathræa squamaria, gathered under an Elm tree in Inwood Copse, near the Hog's Back, Surrey. Mr. Adam White exhibited a specimen of Baladeva Walkeri, and made some observations on that genus in relation to the genus Hypocephalus. He also exhibited a small collection of insects formed at Iskardo in Thibet, by Dr. Thomson. Read a letter addressed to Mr. Curtis by Robert Wakefield, Esq., containing some observations on the habits of ants, to which a paper by Mr. Curtis, read at a former meeting, had given rise. "All modern writers," he remarks, "including Hüber, have, I believe, relinquished the opinion that ants amass Wheat and other grain for their winter store, and that they deprive the corn of its germinating principle; but besides the resemblance of their pupæ to small corn, which a careless observer might readily mistake for seeds, I myself have seen the black species, which I suppose to be Formica nigra, for days and nights together industriously dragging to their cells the seeds of the common violet, V. odorata." As far back as 1832, he had observed them conveying these seeds to their cells, for several successive days and nights. "That they work all night has long been known. Pliny says only during the full moon, but by my memorandums I find I have noted them on the 6th June at work at 12 o'clock midnight, and also on the following night at the same hour, though the day had been stormy and accompanied by heavy rain, without any reference to the full moon. My late friend, Mr. Milne, once told me that he had seen on a morning in February a colony of ants (red) turned up by digging in a garden, and with them were distinctly seen many aphides alive, and also some vegetable substance on which, probably, they had subsisted during the winter. We have all seen the ants caress the aphides during summer and express the sweet juice (query, honey-dew?) they secrete, but I never besides met with any one who had seen the aphides, together with the ants, in their winter retreat."

CALEDONIAN HORTICULTURAL.—At the late Spring Quarterly Meeting prizes were awarded as follows, viz.:—Silver medal to Messrs. J. Dickson and Sons, for Hyacinths Baron de Tuyl, Voltaire, Grand Lillas, Charles Dickens, La Tour d'Auvergne, Regulus, Grand Vidette (blue and white), Lord Wellington, Amy, Emicus, and Prince Albert; second premium to Messrs. Dicksons and Co., for Baron de Tuyl, Prince Albert, Purpurea superbissima, Brooksbery, Madame Vander Hoop, Queen of the Netherlands, Alba superbissima, Passe tubiflora, Tasso, Silene, Mars, and Ida. For six Hyacinths produced by practical gardeners, the Silver Medal was awarded to Mr. Nicol, for Grand Vainqueur, Prince Albert, Baron de Tuyl, Nimrod, and Grand Vidette (blue and white); second premium to Mr. Douglas, for Garrick, Richard Steele, Voltaire, Grand Vidette, Lord Gray, and Laurens Koster. Heaths: Silver Medal to Mr. Smith, Melville Castle, for Erica hyemalis; second premium to Mr. J. Fowler, Glenesk, for the same species; third to Mr. Lockhart, Arniston, for E. mutabilis. Silver Medal to Mr. Reid, Millbank, for a fine specimen of Azalea vittata. First prize for Camellia blooms to Mr. Fowlis, Woodhouselee, for Imbricata, Fimbriata, Palmer's Perfection, Pratti Rosea, Double White, and Reine de Fleurs; second to Mr. Mitchell, Ravelston, for Frankfurtensis, Sweeti, Beali, Double White, Traversi, and Palmer's Perfection. Prize for Camellia plant to Mr. Reid, New Hailes, who produced Imbricata. First prize for Cinerarias to Mr. Addison, Gosford, for Cerito and Lady Gertrude; second to Mr. Mitchell for Ayrshire Lass and Pauline. Hardy Herbaceous Plants:—First prize to Mr. Reid, for Helleborus olympicus and Saxifraga oppositifolia alba; second to Mr Falconer for Saxifraga oppositifolia and Dondia Epipactis. First prize for Chinese Primroses to Mr. Mitchell, for double purple and double white; second to Mr. Fowler for single purple and single white. The best Seakale came from Mr. Kerr, Firth, Roslin. Stalks produced by W. Blackwood, Esq., Peebles, were stated to have been grown in a dark cellar. Roots placed there in November produce a crop in February and March, and are planted out in the open ground in May; this plan was stated to answer admirably. Silver Medal to Mr. Reid, for a beautifully grown Eriostemon cuspidatum; second premium to Mr. Lockhart, Arniston, for Epacris Atleeana. Among productions sent for exhibition only, Mr. Baxter, Riccarton, had specimens of the following fruits in an excellent state of keeping, viz.:—Pears: Beurré Rance, Easter Beurré, Ne plus Meuris, Bezi de Caisoy, La Fortunée. Apples: Blenheim Pippin, Ribston Pippin, Old Nonpareil, Nonsuch, Winter Greening. Grapes: Abercairney Seedling, and White Muscat; also, a dish of Filberts. The Society's Garden contributed Camellia Lady Belhaven, and a number of the Sikkim and other Rhododendrons, including several varieties of R. ciliatum, differing in the colour of their flowers.

Notices of Books.

Dr. Dickinson's Flora of Liverpool (Van Voorst) will, we doubt not, be found a useful guide to the localities of the plants growing wild near that greatest of towns.

A Plain and Easy Account of the British Ferns (Hardwicke) will certainly find favour with the young. The author will have nothing to do with the modern nomenclature of Ferns, which, it must be acknowledged, is sometimes preposterous. On the contrary, he sticks to the good old names to which the world is accustomed. We would not impale a fly, and therefore forbear to say more of the glossary attached to the little volume than that it is a pity any one should undertake to instruct others without possessing some knowledge of the subject taught. By the way, where is the authority for including Asplenium palmatum among British Ferns?

The Distinctions between Commercial Textile Materials. (Die Prüfung der im Handel Vorkommenden Gewebe durch das Microskop und durch chemische Reagentien.) By Dr. H. Schacht, pp. viii and 64; tab. 8. Berlin. 1853.

As the title imports, this is not simply a botanical treatise, but extended to animal productions, such as silk, wool, &c., which, like flax, hemp, and cotton, are used in the manufacture of the various kinds of woven fabrics. In fact, the work is one rather of applied than of pure science, and must be very welcome to the microscopist, as no question is more frequently asked of those who are held in reputation than the means of distinction between such bodies, the importance of which must be obvious in a multitude of cases affecting both civil and criminal jurisdiction, in many curious points of historical and antiquarian research, and more especially as regards the manufacturing interests of the country. The author

has not confined himself to the articles more commonly used, but has passed under review New Zealand Flax, Manilla Hemp, Nettle Flax, &c., nor has he omitted the kindred manufacture of paper, under its different varieties.

The great difference between cotton and the different varieties of flax is that the latter are bast cells, with a more or less thick deposit upon their walls, rendering them less flexible, and having a smaller cavity, which, therefore, contains less air; whereas the cotton threads, on the contrary, are simple cells, consisting almost entirely of cellulose. While, therefore, iodine and sulphuric acid produce a blue tint in the cotton, the xylogen on the walls of the flax prevents it assuming this tint. The cellulose of the cotton is soluble in sulphuric acid, while the threads of flax, &c., are not soluble because of their xylogen; consequently in a mixed fabric, when immersed in sulphuric acid, the cotton threads vanish entirely when the web is repeatedly washed, while the linen threads remain. Again, if oil is applied to such a mixed fabric, the linen threads are transparent, while the cotton, in consequence of its greater content of air, is opaque. Other tests might be mentioned depending upon the different degrees in which colours are taken up by the respective threads. None, however, of these methods of observation is equal to direct microscopic examination, which will enable a skilful observer and manipulator at once to detect the different materials, even when they have been mashed up and treated with various chemical matters for the production of paper. It is of course impossible to enter fully into the matter, but the above sketch will be sufficient to show that the subject is by no means devoid of interest; and when extended to fabrics of wool or silk, or mixtures of them with cotton and flax in its various kinds, microscopical examination and chemical tests are equally certain. For everything in the shape of detail we must refer our readers to the book itself, which will be sure to furnish a good deal of instructive, useful, and entertaining matter, at once applicable to many different subjects of research. As the work is intended not merely for adepts in the use of the microscope, but for persons who have no pretension to science, some preliminary directions are given on such matters, and the mode of using the prescribed tests.

Synopsis Plantarum glumacearum (Stuttgart, Metzler) is the commencement of a revision, by Dr. Steudel, of the Genera and Species of Grasses and Sedges, assisted by the notes of Nees v. Esenbeck. The number before us consists of 80 quarto pages in close double columns. The author having already reached the 568th species of Panicum, we cannot forbear asking, what his idea of a species may be?

New Plants.

59. Anguloa Ruckeri, *Lindl. in Bot. Reg. t.* 41, 1846—*var.* sanguinea.

A fine variety of this rare plant has just blossomed with Messrs. Rollissons. Instead of being yellow, with blood-red dots, like the original, the inside of the flower is one uniform rich chocolate brown; the terminal lobe of the lip is, moreover, broader, and concave, not flat. It is a fine variety of its kind.

60. Pittosporum crassifolium *Bks. and Sol. J. D. Hooker, Flora of N. Zealand, p.* 23.

Recently flowered in the Royal Gardens, Claremont, under the care of Mr. Malleson, who received its seeds from New Zealand some years since. It forms a very dark evergreen bush, with leathery lanceolate or obovate leaves, smooth and shining on the upper side, but closely covered with grey wool on the under side, as well as upon the branches, flower-stalks, and calyces. The flowers are solitary (or, according to Dr. Hooker, sometimes in umbels) and about as large as an Orange blossom, with deep dull crimson leathery petals. The native name is said by R. Cunningham to be "Tarata." The flowers do not appear to have any fragrance.

Garden Memoranda.

Royal Botanic Society's Garden, Regent's Park.—It has been announced, as doubtless many of our readers will have observed, that the plants to be shown at the floral *fêtes* here this year "will be arranged on a new plan, similar in form to the American garden, and placed upon a series of terraces." On visiting this garden the other day, we found that these terraces have been formed immediately behind the Conservatory where the Pelargonium, and Orchid, and other tents stood. An unequally four-sided piece of ground here has been excavated some 8 or 10 feet deep, so as to form banks round its sides. These banks have been cut into stair-like terraces, in two tiers of three each, the one tier being distinctly divided from the other by means of a gravel walk, which winds along the face of the bank, and which is some 7 or 8 feet wide or more, as the case may be; for the under tier of terraces is by no means regular or on the same level as the upper one, but is uneven and broken off here and there into detached pieces by the intersections of the entrance walks, of which there are six, all leading directly or otherwise into the centre of the excavation or basin, where there is to be a large somewhat triangularly shaped piece of gravel for visitors to move about on. These grassy terraces everywhere, except on the east side, where they are straight, project and recede so as to fit the round ends of the tents, five of which, each some 33 feet in width, and three of them at least 153 feet in length, are to cover the whole exhibition to be held here, over which they will be supported by round poles of Baltic Spruce, the centre ones, or where the excavation is deepest, being some 30 feet in height. The whole space thus covered will be about 153 feet in width, and 165 feet in length. The entrances from the road on the Colosseum side, and from the garden on the west or lower side, have been cut through the embankments, and are covered over with boards bridge fashion; and immediately in front of the last-named entrance, but a considerable way in advance of it, is to be a terraced mound for showy plants, which will catch the eye on entering, and form a striking feature for the background. The terraces vary from 2 to 3 feet in height, and from 1 to 4 feet in width. The uppermost three terraces, we are informed, are intended for large plants, and the lower three for Pelargoniums and things of comparatively dwarf growth. The walk which passes between the two series of terraces will enable visitors to look up at the one tier and down on the other, while the whole may be seen at one view by persons standing in the bottom of the valley below. Whether fruit will be shown in this manner or not is a matter not yet decided; but if it should be, some straight terraces have been made on purpose, to suit the boards on which it will be placed. The turf on the terraces is already established, and beautifully green; but the formation and gravelling of the walks have not yet been completed. A Box hedge is to be planted all round the top of the banks, so as to form a background for the plants, of the effect produced by which, exhibited in this way, we shall soon have an opportunity of judging. In other parts of the garden some slight alterations have been effected. The rectangular strip of ground formerly occupied by the large tent in which the stove and greenhouse plants used to be shown is being converted into a small flower garden, laid out in different devices of small beds, bordered with Box and gravel, the whole being on Grass, and surrounded by straight gravel walks, about 15 inches higher than the plats on which the figures are. These little beds, for they are very small, are to be filled with low-growing plants, which will be trimmed in, so as to distinctly exhibit the forms of the figures. A new shell-like device of beds, with an embroidered band at the back, has also been made to fill a little recess at the base of the hill, on the right of the walk leading from the principal entrance to the conservatory. At present these beds are chiefly filled with Pansies, for early display. Some of the plants for exhibition in the American garden have already arrived, and will soon be put in their places. The whole of the framework which supports the covering of this exhibition is being renewed, the upright posts below the surface level having been found to have become too much decayed to stand another season. They were made of Baltic Spruce, and had been up six years. They are reported to have been more rotten where they stood comparatively dry than where they were in clay, full of water. Other alterations consist of a new refreshment room, which is to be built in the room of the old one, which has been removed. The plants in the conservatory have wintered well, and some of them are now very gay, a few large Azaleas being literally masses of flower. One or two bushes of Acacia armata and Cytisus racemosus have been, and are still, extremely effective, but the bright sunny weather we have been experiencing is driving things fast out of bloom. Pelargonium album multiflorum, in the shape of a pyramid some 4 feet high, was full of blossom, and we noticed several other Pelargoniums grown in this way, which, if they flower as freely as this has done, must be extremely useful in large houses like this. In the open grounds the winter has been less severe than it has been in some places. Ornamental Cherries and other spring-flowering trees, Wallflowers, Polyanthuses, Hyacinths, Early Tulips, Pansies, Alyssums, and Iberis sempervirens, are in full bloom. The Grass has been gone over with the mowing machine, and, although yet somewhat bare and bleak in appearance, the garden is altogether in good order.

FLORICULTURE.

The Chrysanthemum.—As I am usually more successful with this flower than my neighbours, and as it is well known to be invaluable for conservatory decoration during the winter and early spring months, being now to be had of every hue and tint, from the purest white to a beautiful crimson, I have been induced to furnish you with the following remarks, which may be useful to the amateur gardener. About the second week of April I choose my cuttings from the points of the present year's growth. I insert them in a light compost of leaf soil and river sand, and plunge the pots in a pit or frame where there is a slight bottom-heat, which will enable them to emit roots freely. I always, however, prefer offsets when I can get them, *i.e.*, taking single suckers and pinching them back to three or four eyes. If specimens are wanted I put three of these suckers in a 5-inch pot, 2 inches apart, in a compost of two-thirds turfy loam, and one-third well decayed cow-dung, adding also a portion of sand, to keep the soil porous, and taking care to secure good drainage by using plenty of potsherds, over which I put a few pieces of turf. This keeps the drainage open, which it should be, as the Chrysanthemum does not like to be kept in a stagnant condition. I now place them in a cold frame, shading them from the mid-day sun until they have taken hold of the new soil, giving as much air as possible throughout the day, but shutting up in the evenings till about the 1st of May, when the lights may be taken entirely off them, or the plants may be turned outside into some sheltered situation, where they may remain till the middle of June. While exposed they will require no attention, except that of giving them a good supply of water, for the Chrysanthemum delights in having the roots kept moist. They may also be sprinkled over-head twice a week, which will keep them in a fine healthy condition. Stake thinly, so as to admit plenty of air, which will prevent them from becoming drawn. About the middle of June give them their final shift into 10-inch pots, using a rough compost of good turfy loam two-thirds; rotten cow-dung one-third; to which add a sprinkling of bone-dust and charcoal. After potting tie them out neatly to nice green painted stakes, and plunge them in a sheltered situation, but well exposed to the sun to within a couple of inches of the rim of the pots. Give them a good supply of water now, night and morning, or as often as required; also give them a good syringing over-head every other evening with clear water, which will keep down green-fly; but should this pest make its appearance syringe with tobacco-water, which will soon cause it to disappear. A little manure-water now and then will enable them to push strong shoots; for unless the latter are strong you need not expect to get good blooms. About the beginning of October move them in-doors, and have them nicely tied up and dressed; also put a good mulching of sheep-dung on the tops of the pots; the strength of this will wash down with the water used in watering, and will assist them greatly during the blooming season, when they may be taken to the conservatory or greenhouse, as the case may be. By following these directions the Chrysanthemum may be grown in the greatest possible perfection. *W. F.*

The Fuchsia.—I am a self-taught amateur, and have grown this plant for a series of years, and have obtained prizes at exhibitions, judged by some of your most celebrated contributors, for specimens the equal to which I have not yet seen at the great metropolitan shows. My plan of management was this: In July I struck my cuttings, and as they required it I repotted them from time to time, using turfy fresh soil, a little rotten manure, and sand. They were kept in a moderately warm house, and in a growing state through the winter; as the warm weather in the following spring progressed, and at the repotting at that time, I sunk them deep in the pots, and as the roots were seen running on the surface of the soil, which they will soon do, if kept well syringed in a moist atmosphere, I kept filling the pot up with lumps of decayed sods and the compost they were originally potted in; a little weak manure-water was occasionally given. I never cut or stopped any branch, and only used one stake to keep the plants upright. The plants were studded with branches full of flowers, overhanging the pots, and to the height of from 5 to 10 feet, according to the variety. They were literally Nature's own specimens, and nothing could certainly be more beautiful than to see 40 or 50 such plants, of different shades and colours, pitted against each other. I had no propagating house, no frame to move them to after striking, no brickbats, no coal-ashes, or fine ashes on the top, as recommended by your correspondent "A. C." I watered them in the morning, then went to my business and remained till evening, when the Fuchsias in the mean time attending to their own wants. When exhibited, my plants were from 10 to 12 months old. *R. R. R.*

National Floricultural Society, *April* 20.—Azalea Criterion, from Messrs. Ivery, of Dorking, received a first class Certificate. Its flowers are large and showy, of a light salmon colour, distinctly margined with white, and spotted on the base of the upper petals with crimson. It is in the way of Exquisita; but, as will be seen, it is very different in colour. A first-class Certificate was also awarded to Azalea Robinsoni, from Mr. Robinson, of Pimlico. This is a very pretty rosy pink variety; but scarcely perhaps sufficiently distinct from kinds already in cultivation. Mr. Ivery, of Peckham, received a Certificate of Merit for Cineraria Admiral Dundas, a clear white ground kind, edged with crimson purple; disk same colour, a showy kind. Messrs. E. G. Henderson sent some fancy Pelargoniums and Cyclamens, the latter all varieties of C. persicum. The same firm had also a promising Cineraria called Emilie. Cineraria Celestial, from Messrs. Henderson, Pine-apple Place, is also a good variety, which we hope to see again.

Miscellaneous.

Sale of Plants at Ealing Park.—The sale of Mrs. Lawrence's magnificent collection of stove and greenhouse plants commenced on Thursday last, and will be finished to-night. The first day was wet and cold; nevertheless upwards of 50 people attended, consisting of the principal metropolitan nurserymen, several noblemen and gentlemen's gardeners, and one or two gentlemen. Among the latter we noticed, W. Upton, Esq., of Forest Hill, and H. Colyer, Esq., of Dartford. The plants were for the most part in good condition, and realised, upon the whole, fair prices. When we were present on Thursday some of the largest of the specimens were brought forward. We observed that the enormous Epacris grandiflora, which for many years formed the crown head of the Ealing Park collection at the Chiswick fêtes, was bought by Mr. Eyles for the Crystal Palace Company for 12*l.* 10*s.*; this fine plant was quite 6 feet high, and as much through, and covered with bloom. A Polygala acuminata of similar size, and also in flower, was put up, and fetched 10*l.* 15*s.*; this was purchased by Mr. Upton, who also became the fortunate possessor of a magnificent Azalea exquisita, for which he paid the handsome sum of 17*l.* 17*s.*; this plant was in all respects in excellent condition, and measured about 5 feet in height and 6 feet in width. The same buyer likewise purchased a

beautiful Azalea variegata, 4 feet by 5 feet, for which 15*l.* 15*s.* were paid. An extremely good plant of Azalea Gledstanesi fetched 10*l.* 10*s.*; this was purchased by — Johnstone, Esq., of Oak House, Feltham. Azalea Lawrenceana (which did not appear to be different from Minerva) fetched the great price of 24*l.* 3*s.*; this was bought by Mr. Upton; it was certainly a splendidly grown plant, measuring 4 feet in height and 6 feet in width. Azalea Apollo, 5 feet by 4 feet, fetched 8*l.* 10*s.*; and A. Gledstanesi, 7*l.* 5*s.* Azaleas, altogether, fetched good prices, as did greenhouse plants generally; although some Heaths, Eriostemons, Podolobiums, Indigofera decora, and a few other things, sold for prices considerably below their value. Stove plants seemed less in demand than greenhouse plants, and therefore realised less money. Beautiful bushes of Ixora javanica, 4½ feet in height, and 3½ feet in width, only fetched 2*l.* 10*s.*; Dipladenia crassinoda, 4 feet high, and 3 feet through, 10*s.*; Allamanda cathartica, 5 feet high and 4 feet wide, 2*l.* 15*s.*; and other plants of this description fetched similar prices. The number of lots sold to-day was 161; the principal purchasers, in addition to those already named, were Mr. Colyer, Mr. Ambrose Basset, of Stamford Hill; The Earl of Stamford and Warrington; Mr. Dods, gr. to Sir John Cathcart, Bt.; Mr. Walker, of Acton; Mr. James Veitch, of Chelsea; and Messrs. Fraser, of Lea-bridge.—Yesterday about the same number of buyers assembled, and a similar number of lots was sold, but they did not fetch near such high prices as they did on Thursday. The plants were, however, generally smaller. A Pimelea spectabilis 5 feet in height and 6 feet in width, was bought by Mr. Colyer for 6*l.* 15*s.*; a Dillwynia, 2½ feet high, and as much through, was knocked down to Messrs. Fraser for 5*l.* 5*s.*; Boronia serrulata, 2 feet in height, and a little more in width, was purchased by Mr. Veitch for 5*l.* 15*s.*; Mrs. Treadwell had a Chorozema Henchmanni, 3½ feet in height, and 4 feet in width, for 3*l.* 15*s.*; Erica metulæflora bicolor, one of the handsomest of the genus, measuring 3½ feet in height, and as much through, was purchased by Mr. Turner, of Slough, for 2*l.* 10*s.*; Franciscea latifolia, 2 feet high, and as much through, was bought by Dr. Daubeny, of Oxford, for 17*s.*; the same gentleman also purchased an Adamia versicolor of similar dimensions for 1*l.* 2*s.*; Boronia pinnata, 3 feet in height, and more in width, was knocked down to Mr. Speed, of Edmonton, for 2*l.* 12*s.* 6*d.* Coleonema rubrum, a beautiful plant, 6 feet high and as much in diameter, was bought by Mr. Eyles for the Crystal Palace Company for 3*l.*; other lots fetched from 10*s.* to 4*l.* each.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Among winter-blooming plants we have few that are so attractive and so useful as Gesnera oblongata and Euphorbia jacquiniflora, both being profuse bloomers, and remaining long in beauty. These should be extensively grown wherever winter flowers are valued; and if at the expense of neglecting some of our more recently introduced subjects, they should be afforded every necessary accommodation and attention at the present season, in order to secure good specimens for next winter. Also attend to affording Correas sufficient pot-room and a growing temperature, so as to induce free growth at the present season, and get the wood well matured early in autumn, which is the secret of having them finely in bloom throughout the winter. Primula sinensis, especially the double varieties, is also deserving of every attention, and should not be neglected at the present season. Pot off seedlings of the fringed varieties, and encourage them with a moist genial temperature, shading them slightly on bright days. Unless there is a good stock of young plants of the double varieties in hand, the flowers should be picked off the old plants as soon they show any symptoms of weakness, shaking the exhausted soil from the roots, and repotting in light fibry peat, well intermixed with sand, keeping the plants well down in the pots, and placing them in a warm shady situation. This will obviate the difficulty which many growers experience in the management and propagation of these showy winter flowers; for if the plants have not been too much exhausted by flowering, young roots will be freely emitted from every branch; and when this is the case, the plants should be broken up and repotted separately, affording them a rather warm and thoroughly moist atmosphere until they become well established, when, with ordinary care, they will grow freely, and form fine specimens before winter. Fuchsias intended for large specimens will require to be shaded from bright sunshine, and will be greatly benefited by a liberal supply of manure water; and where free growth is expected from these, after this season, the atmosphere can hardly be kept too moist. Young specimens of greenhouse hard-wooded plants should be kept as moist and warm as can be done without inducing weakly growth. See that these are properly supplied with water at the root, and do not allow them to sustain any check for want of pot room. STOVE.—Attend to training the shoots of twiners as they advance in growth, and do not allow these to get entangled before giving them attention. Also attend to the stopping and training of other plants, and afford free growing subjects plenty of pot room. Achimenes and Gloxinias, filling their pots with roots, will enjoy an occasional watering with weak manure-water. Persevere in keeping down insects, which, if allowed, will progress with great rapidity. Very little fire-heat will now be sufficient, if the practice of shutting up early in the afternoon is adopted. Proceed with repotting Orchids as they may require it. Do not use the syringe too freely among those starting into growth, but keep the atmosphere thoroughly moist. See that specimens on blocks and in baskets are not allowed to suffer for the want of water, for when the soil in baskets is once allowed to get thoroughly dry, the water is apt to run off; when this is found to be the case the baskets should be immersed in tepid water until the soil gets thoroughly soaked.

FORCING DEPARTMENT.

PINERY.—Use the syringe lightly morning and evening, except where the fruit is colouring, but avoid too copious syringings, which sodden the soil about the collar of the plants, and render it very difficult to keep the roots in a properly moist state. Therefore, use means to maintain a thoroughly moist atmosphere, without a too free use of the syringe over the plants. See that none of the young stock is allowed to suffer for want of pot room, for a short time's neglect at this season will be very apt to throw them prematurely into fruit. Maintain a brisk bottom-heat, as near 90° as can be managed, but do not exceed this. Also keep the atmosphere as warm as the plants will bear with ut drawing. Successions, if all right at the root, and near the glass, will enjoy from 65° to 70° at night, and 75° to 85° by day, and 5° higher at night and 10° by day will be proper for plants swelling their fruit. Shut up early on sunny afternoons, giving the house a good steaming. VINERIES.—As soon as the fruit in the early house is fairly ripe, discontinue the use of fire heat, except when necessary to dispel damp; and admit air freely, keeping the atmosphere cool, to prevent the increase of spider, and preserve the foliage in a healthy state as long as possible. Where fermenting materials are used on the border, the heat should not be allowed to decline while the fruit is colouring. See that Vines growing in pots or boxes are liberally supplied with manure water. PEACHES.—Where the trees are in a healthy vigorous state, there will be little trouble in keeping insects under, but where they are weakly, or over-cropped, it will be very difficult to keep red spider in check. Give the trees a liberal dressing with the engine the moment this pest is perceived, and see that everything is done to keep the trees in vigorous health. Thin the crop freely as soon as the stoning is over, and avoid leaving more than the trees can bring to perfection, the result of which would be small flavourless fruit, and a continual war with insects and mildew. The quantity to be left on a tree, however, must be regulated by its condition; but do not be afraid to thin freely.

FLOWER GARDEN AND SHRUBBERIES.

The long continued cold northerly winds render the management of bedding stock unusually difficult this season; for it is still dangerous to risk even the hardier kinds from under the protection of glass. All that can safely be done until the weather changes, in the way of hardening the stock, preparatory to its being planted out, is to give as much air as circumstances will admit, without injuring the plants; and to place Calceolarias and the stronger Verbenas in turfy pits, where they can be securely protected at nights, and sheltered from the drying winds. Such things, when removed to cold pits, should be planted out in fine, very sandy soil, which will save trouble in watering, and be much better for the plants than keeping them confined in small pots. Tender annuals that have been raised in heat should be pricked out in light soil under hand-glasses, in order to get them strong before planting out time. If not already done, hardy annuals should be sown after the first shower, and do not forget plenty of Mignonette and Stocks, the fragrance of which will always render them favourites. Look over the stock of plants at present in flower, and mark the most admired for propagation at the proper season.

FLORISTS' FLOWERS.

This last night, Tuesday, 25th inst., there has been a severe frost, and all uncovered Tulips appear somewhat affected by it; fortunately, the beds and foliage are perfectly dry. Amateurs will see from this the necessity of giving the best beds, at all events, the necessary protection; very little will do it, a covering of Haythorn's hexagon net will be found efficacious, both against frost and hail. As the plants rise, the stems should be supported. The best way we have ever seen is to have neat sticks painted green; one of these placed between four bulbs will, with the aid of metallic wire in lengths of 6 inches, one end of which is placed round the support, whilst the other forms a small loop, like the eye of an ordinary skewer, round the flower stem, keep the blooms in their proper position, and the amateur runs no chance of his flowers dashing against each other. It has been a serious time for late planted Carnations and Picotees, which, if not carefully watered and tended, will infallibly spindle weakly. Put the sticks to the plants, and place oyster shells on the surface of the pots, that in watering the soil may not be washed away from the roots. Harden off Dahlias, and top-dress Pink beds, if not previously done; when the plants are throwing up too many shoots for blooming, cut them back, if strong, to three shoots, if weak allow only one. Remove Auriculas to their blooming stage, protecting the blooms with a slight awning.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Commence disbudding Peach trees, &c., but do this carefully at first, going over them two or three times, so as to prevent a too sudden check to the flow of sap, and afford the fruit the protection of the leaves, &c., as long as it can be done without injury to the trees. Look sharply after green-fly, and apply tobacco water the moment it is perceived; on light sandy soils, however, it may be kept in check by frequent washings with the engine. But, whatever method is preferred, see that it is applied before the pest gets established.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending April 27, 1854, as observed at the Horticultural Gardens.

Friday 5	62.7	41.1	51.9	17	1.26	5	5	3	3	7	3	1	1
Satur. 6	60.8	40.2	50.5	12	0.68	—	9	3	2	3	6	3	2

The highest temperature during the above period occurred on the 6th, 1830—therm. 81 deg.; and the lowest on the 2d, 1852—therm. 25 deg.

Notices to Correspondents.

ANEROIDS: *Quæstor.* Apply to Dent at Charing Cross, or to Newman in Regent Street. It is a philosophical, not an optical instrument. We believe the patent is English as well as French.

BOOKS: *G B.* Kitto's Cyclopædia can be had through the usual channels of the book-trade.—*C H.* We are sorry you do not understand your business—but are unable to assist you. Books do not communicate the information we understand you to require.

BROCCOLI: *Melville.* The two heads sent for inspection are nearly as white as those of a Cauliflower, and every way about as good. If the variety, therefore, is as hardy as you state it to be, it is certainly an acquisition. ‡

GARDENERS: *E A.* No regular gardener thinks of being tied down to time like a labourer. But a labourer can only be required to work from some hour in the morning to some other hour in the evening which may be agreed upon. For extra time he claims extra pay. Winter is his holiday.

GRAPE MILDEW: *A Gardener.* The only *sure* remedy is sulphur; apply it to the parts affected, either by means of a sulphurator or otherwise, but first wet them well, in order to make it stick. ‡

INSECTS: *B H.* The small objects infesting the flower buds of your Orange tree are the coccus or scale of the Orange. They have no means of gnawing off the buds, the fall of which is most probably attributable to some other cause. Oil, or turpentine, or, better still, hand picking, will destroy them; or, if on the stems, washing with hot water.—*R L.* The insects at the base of the young shoots of your Peach trees are small unimpregnated females of Coccus Persicæ, with a pupa of the male. For remedies, see answer to *B H.*—*H P.* The beetles which have attacked the buds of your Roses and fruit trees are the common weevil, Otiorhynchus tenebrosus. Spread a cloth under the trees infested by them during the day, and then shake the trees well over the cloth about midnight, when the beetles may be caught in great numbers, and destroyed by being thrown into boiling water. *W.*

NAMES OF PLANTS: We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*X.* Apparently a bit of Juniperus squamosa.—*A W W.* Browallia Jamiesoni.—*M J Rae.* 1, Aubrietia deltoidea, 2, Phlox setacea; 3, Arabis alpina.—*C F.* It seems to be Salix fragilis. Such branched catkins are very uncommon; but since catkins are only branches, it is not surprising that they should branch.—*J C L.* Your Curcuma is rightly named; but it is a mere variety, we think, of the common Turmerick. The others are Oncidium hians, a rarity; Maxillaria ochroleuca, and Epidendrum oncidioides.—*Rosetta.* Celsia arcturus.

NEW ZEALAND FLAX. We do not know of any field of this plant existing in the United Kingdom; nor do we believe it could possibly pay.

OSAGE ORANGE: *W H J.* You shall hear about this plant next week. It is quite hardy, and no doubt a capital hedge plant. Seed may be had of Messrs. Charlwood & Co.

PRUNING: *Ballandyne.* Prune everything in mid-winter, except such evergreens as common and Portugal Laurels, Sweet Bays, and the like, which should be let alone till the middle or end of April.

SEED-STEEPING: *J Diver.* We repeat that experiments, most carefully conducted, prove the case against you. You may as well, in face of existing evidence, say that the sun shines at midnight.

THE CRYSTAL PALACE. We have made the requisite enquiry, and have now to tell you, that if you had taken the trouble to ascertain the whole truth, and nothing but the truth, it would have been much more to your credit. We have heard of persons, calling themselves gardeners, taking a waggon load of stove plants to Sydenham in the midst of a hard frost. Do you happen to know who they were?

THE SCARLET RUNNER: *G P.* It is a tuberous perennial; and, what is more, its tubers are highly poisonous.

VARIATION OF THE COMPASS: *A Subscriber.* We make it a rule never to answer questions having no relation to the particular subject of our paper—namely Horticulture, Agriculture, and Rural Economy.

WOOD PAPER: *W and B.* Will you favour us with your address?

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.
The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturist's London Agent, 1A, Bishopsgate Street Within.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.
Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL and Co., 204A, Upper Thames Street, London.

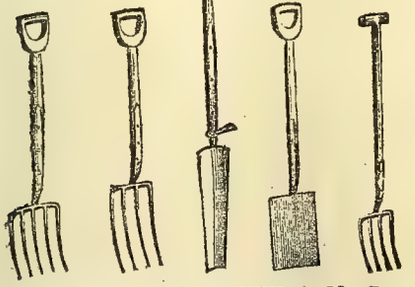
THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE "ECONOMICAL" MANURE.
A COMPLETE AND BY FAR THE CHEAPEST SUBSTITUTE FOR GUANO.—1½ to 1½ cwt. per acre of this powerful Manure, costing 15s. to 18s., is ample (more must not be used), and equals 3 cwt. of the best Peruvian Guano, thus saving at least 50 per cent., besides carriage, &c.
Hundreds of Testimonials from all parts of England, Scotland, and Wales, France, Belgium, and Spain, prove this, and show that it gave most wonderful results last year on every soil, as well on grain and Grass as on root crops, far surpassing the expectations of the purchasers. Price 12s. per cwt., packages included, and delivered free on rail or wharf in London. Testimonials, directions for use, and all particulars, to be had gratis at the British Economical Manure Company's Offices, 10, Mark Lane, London, or sent on applying to
BENJAMIN COVENEY, Manager.
N.B—This Manure, unlike Guano and artificial Manures generally, does not require rain to render it effective. Sown broadcast and left on the surface (the best way of using it) it will not lose its virtue, and has the peculiar property of attracting sufficient moisture from the atmosphere.
Good Agents wanted. An allowance to the Trade.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

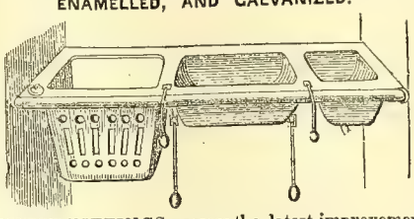
PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WATERPROOF PATHS,—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

BARTON'S PATENT STABLE FITTINGS, PLAIN, ENAMELLED, AND GALVANIZED.



THESE FITTINGS possess the latest improvements, and are superior to any hitherto manufactured. Patent dated 19th Oct., 1853. Stable Furniture, of every description Iron Gates, Railing, Strained Wire Fencing, Hurdles, Sheep and Game Wire Netting, Registered Poultry, Fountains, Feeders, &c. —JAMES BARTON, IRONMONGER, &c., 370, Oxford Street, a few doors east of the Pantheon.
CAUTION.—Other Stable Fittings of this description assuming to possess all the latest improvements, registered and patented, are fictitious.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

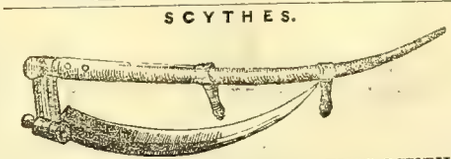
Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.
The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,
JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.
Every description of Machinery for Raising Water; Fire Engines, &c.

WEIR'S DRAINING LEVEL,
PRICE 30s.
These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.
EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road) Removed from Oxford Street.

SCYTHES.



BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.
"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.
To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

CHAFF-CUTTERS, of the best workmanship, 25s.; Two-Knifed Chaff Engines, from 63s.; Mills for Bruising Oats and Beans, from 45s.
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

RICHMOND AND CHANDLER'S No. 1 CORN CRUSHER (Price 5l. 5s.) was first introduced a few years ago, as a decided improvement upon others theretofore made. Subsequent time and experience have served to render it more perfect, and to greatly extend the pre-eminent patronage of members of the Royal Agricultural Society and distinguished scientific authorities throughout the world.—Address, RICHMOND & CHANDLER, Implement Works, Salford, Manchester; and 32, South John St., Liverpool. Export orders completed on the shortest notice.

THE THIRD CHELTENHAM SUMMER POULTRY SHOW will take place at that magnificent establishment PITTVILLE SPA, on the 14th and 15th of June. For Prize Lists and full particulars enclose a stamped directed envelope to JESSOP BROTHERS, Secretaries.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

The Agricultural Gazette.

SATURDAY, APRIL 29, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

MONDAY,	May 1	—Central Farmers' Club.
WEDNESDAY,	— 3	—Agricultural Society of England.
THURSDAY,	— 4	—Agricultural Imp. Society of Ireland.
WEDNESDAY,	— 10	—Agricultural Society of England—Lecture by Professor Way.
THURSDAY,	— 11	—Agricultural Imp. Society of Ireland.

THE oldest farmer living never probably experienced such a contrast as the present season and the spring of 1853, have exhibited. The two together illustrate the triumphs of art over natural systems; for undrained and slovenly managed lands, under both excessive rain and excessive drought, soon tell a very intelligible tale, both on Grass lands and arable.

We do not recollect when we have seen the plastic clays of Surrey so deeply rent in fissures at the middle of April as they have been this year, especially those undrained and deficient of manure; more particularly Grass lands when poached with the feet of cattle, or winter Wheats, when they had been poached in ploughing and sowing, followed by imperfect water furrowing—examples presenting very remarkable contrasts in farming, when compared with adjoining fields properly managed. *Here*, for instance, is a large park, divided by railing into several Grass fields—one of which had been poached, and was, when we examined it on the 20th inst., as brown as if at midsummer, and rent in fissures, so that you might thrust in your arm to the elbow in them. A second had not been poached, the cows having been removed in time; it is also very much rent, but the Grass is, nevertheless, fresh and green, although short. A third, also free from poaching, is in high condition, being full of manure, and much less rent than the second; indeed, the fissures are hardly discernible, while the Grass is nearly as long as to exclude subsequent injury from drought. Now, these three fields abut upon each other, the one running alongside the other two, and only divided by railing, so that the contrast which they exhibit is very conspicuous. The three are composed of brick earth, and they are naturally equal in quality. *There*, again, are fields under arable culture which present similar contrasts of farming. On one, ploughed and sown in autumn in a very wet state, the Wheat plants are thin, and, although green, are fast preparing to shoot forth tender seed stems. Indeed, prior to the change of weather, they were assuming a stunted and dwarfish appearance, as it were, while a healthy crop of weeds is fast coming into sight. On an adjoining field, again, the young Wheat plants are of a dark green colour and tillering vigorously. Young seeds and Tares presenting similar contrasts might be quoted from the district, where some fields are so rent in fissures as to bring vegetation to a premature conclusion, while others have not, up to the late change in the weather, sustained any injury either from drought or cold easterly winds, with frequent frosts at night.

The season, so far as it has gone, has been, no doubt, a trying one for newly drained Grass-lands unaccompanied with top-dressing, to counteract the sudden transition experienced by Grasses accustomed to grow in a soil loaded with an excess of moisture; and the same may be said of arable lands, where the clod-crusher, grubber, &c., have not kept pace with the weather.

On the contrary, it has not only been highly favourable for draining, with other improvements and general management, and for crops on lands properly farmed, but also continues to be so. And the showers that have been falling in different places, ever since the afternoon of the 20th, although cold, have tended still further to improve appearances, so that even the scorched fields already referred to are recovering themselves, and may yet yield good crops; for, according to the old proverb, "it is May that makes the hay."

IN pursuing our remarks on ARTERIAL DRAINAGE we come now from foreign excursions to our English doings at home. And, like true drainers, we shall begin with the *outfalls*, although these have been, in actual practice, about the last points attended to. Our principal rivers discharge into shallow estuaries, where they are in danger of being choked with tidal sediment; these, therefore, will receive our chief attention. But we must also advert to the case of those streams which are contesting for a free outflow against the rough and stormy billows of a deep sea; threatened either by gathering shingle or insidiously accumulating sand. Persons acquainted with the Channel coast know the wonderful changes which the ocean there is continually making—even a single storm transforming the gently declining shingle beach into a terrace of pebbly cliffs. The stones torn or crumbled from one portion of the coast are carried eastward along the bed of the sea by the strong impulsion of the tides and waves; being unceasingly ground and rounded as they proceed, they are thrown up upon certain lines of the shore, forming immense banks and piles of material, ever changing in shape, and subjected to either incessant wear or addition. Sometimes the outflowing current of a river is able to divert this accumulation from forming at its mouth; in other places the minor estuaries have been or are gradually becoming blocked up with the beach, which defies all attempts to wash or scour it away by the force of the land-waters, speedily refilling any channels that may be mechanically excavated, and overwhelming or surrounding any barrier erected against its advance. In such a case the engineer, unable to overcome nature, succeeds by strategically assisting her. Observing the beach to gather most on the eastern or more sheltered side of a promontory, he sagaciously constructs an artificial

projection or jetty at a point considerably to the westward of the estuary he designs to screen; this, shooting off the boisterous breakers, provides a still-water cove behind it, in which the shingle bank may grow at will; and enticing the deposit to this spot, leaves the river mouth still clear and open. But as the beach when thrown upon the shore is not safely stranded, but is from time to time eroded from one wing of the shoal, and cast up against the other,—so that the deposit in fact travels slowly along the coast,— other precautions become necessary; and great perplexity and difficulty often arise in staying the stealthy progress of this blockading foe of the rivers. Mischief, however, is not the sole order of action of the beach; to the protection offered by it to the cliffs of soft material at the base of which it may gather, we owe the preservation of long reaches of our southern coast; and many large areas of low land have also been reclaimed from the sea mainly through the agency of this naturally-growing bulwark.

As an example of the great transmutations which are wrought on low shores and in river estuaries by the shingle beach and by a fierce ocean, we give the instance of *Romney Marsh*—including not only the 24,000 acres properly bearing this name, but also nearly 20 contiguous marshes and levels in Kent and Sussex, unitedly comprising a total of about 60,000 acres, won from the sea. Originally, all these formed one great bay of the English Channel, 20 miles wide at its mouth, between Fairlight Cliff, in Sussex, and the hills at Hythe, in Kent; with a depth of indentation of six miles. Four rivers, the Rother, Exden, Brede, and Tillingham, flowed into it; and the islands of Oxney, Rye, and Winchelsea rose from the waters off its western shore. During the Roman period of Britain, the shingle and alluvium had raised a small island in the middle of the bay—the present site of Old Romney; this was first embanked (in all probability by that people) on the north and east, being already naturally raised above the tides on the south, and was called Roman-ea, or the Island of the Romans. Deposits gradually accumulating, the bed of the bay became more or less bare at low water; the main stream, the Rother, together with the Exden, divided into two branches, one passing across its centre from Appledore by Romney to deep water, the other under the northern highlands to Hythe; while the Tillingham entered the sea south-west of Rye, and the Brede south-east of the rock on which Winchelsea stands. In the 13th century some violent storms and inundations destroyed "Old Winchelsea," one of the Cinque Ports, so that it never again emerged from the sea; united the island of Lyd with the mainland, by the influx of beach and sand; and diverted the main channel of the Rother to an outfall many miles west of the central outlet by Romney. By the middle of the 14th century, most part of Romney Marsh was inclosed, and the northern river channel was altogether lost. The rivers had no well-defined mouths, but spread at high water over the expanse of oozy shoals between the Sussex highlands and the lands already embanked in Romney Marsh. In the course of the sixteenth century Guldeford rose into existence, having the principal estuary between it and Rye. The harbour of Rye, before the year 1664, had no connexion with the Rother; and the Brede and the Tillingham had not sufficient strength of current to keep it open; so that it was choked up and lost. The "fulls" of beach have formed under Fairlight Cliff, and then travelled eastward until the outflow of the Rother checked their progress; when one range or ridge was thus stopped, another began at the first point, and continued outside along the same line—more and more threatening the harbour and estuary. Under an act of Parliament of 1722, a new channel was cut from the strand near Fairlight Cliff to receive the waters of the Tillingham river; and also of the Brede, which entered it nearer to the present Winchelsea. These streams not supplying a sufficient volume of water after a great expenditure of time and money, it was determined, in 1769, to turn the Rother also into the new harbour. Accordingly a dam was at once put across one of the branches by which this river then discharged; and in 1787 the other principal passage was similarly stopped. The landowners, however, complaining that their drainage was thus obstructed, the first dam was cut, and a channel made in its stead 130 feet wide at top; this caused the "old harbour" to improve and remain the present harbour of the town; while upwards of 60 years had elapsed, and 200,000*l.* had been expended in the construction of the "new harbour" to no useful purpose.

This illustration will show the magnitude of the difficulties attending the maintenance of estuaries upon a shingle shore, where we can only occasionally succeed in making use of the obstacles with which Nature shuts up our waters. *I. A. C.*

FARMING NEAR LIVERPOOL.

Whilst Lancashire is universally famous for its arts and manufactures, there is perhaps no county in the kingdom, the agricultural merits of which are so unappreciated. Satisfied with the reputation of its merchants and its manufacturers, it would seem willing to waive that consideration for the character and the position of its husbandmen which might so reasonably be demanded for them. Nevertheless, there is now much farming in Lancashire of the highest order. It is quite true that with all its advantages of roads, canals, and railways, with its insatiable markets, and inexhaustible supplies of manure, this part of the country has not hitherto progressed agriculturally to the extent which might have been expected from it. The time has, however, happily arrived when the farming of Lancashire promises soon to assume that character which ought to belong to it, and which a vast and rapidly increasing population requires. It may confidently be asserted that for the last 10 years, in many districts of the southern and the most populous portion of the county, agricultural produce has at least kept pace with the demand for it; and what more could be said for Lancashire farming? By draining and the improved modes of tillage, the fertility of the land has been greatly and permanently improved. The productive area, too, has been increased by many hundreds of acres—by the eradication of old and useless fences, the filling up of ditches, and the enclosure of waste land. This is particularly the case in the neighbourhood of Liverpool. For many years, now, Lord Derby the worthy proprietor of extensive estates in the neighbourhood, has wisely and vigorously carried on these improvements. Nor can less be said of his excellent neighbour Lord Sefton, on whose estates are now many first-rate farms; and besides these noblemen, the names of other local proprietors might be particularly mentioned as improvers. Unquestionably to the beneficial influence of the Manchester and Liverpool Agricultural Society, the agriculture of this part of the country is very largely indebted for the vast improvements already effected in the art, and for the great progress which is evidently taking place at the present time. But the farmers themselves are the parties to whose skill and enterprise these decided improvements are mainly due. The management and productiveness of many farms in this locality, though they may be equalled, are certainly not much surpassed by any in the kingdom. One of them I have just had the opportunity and pleasure of inspecting; it may be taken as a fair specimen of many in the district, cultivated for produce exclusively for the Liverpool markets; and as it is worthy of the highest commendation in every respect, some account of it may not be uninteresting to agricultural readers in general:—

The farm is Mr. John Lathbury's, in the township of Toxteth Park, and is occupied by him on a yearly tenure, under the Earl of Sefton; it lies about 130 feet above the level of the sea. The soil is a lightish sandy loam, from 12 to 18 inches deep, on a subsoil of white and, in some places, yellow sand; this is incumbent on a bed of clay and marl, from 6 to 8 feet deep, the whole resting upon the new red sandstone formation. Within the last five years the entire farm has been drained with common horse-shoe tiles, 13 inches long and 2⅝ inches wide inside, and laid on slate soles; the drains were all laid on the parallel system, averaging from 4 to 5 feet deep, and 10 yards wide; cinders, to the depth of 9 inches, were placed over the tiles. The work has proved quite effective, as the land is now perfectly dry and in the most satisfactory condition. Within the same period the farm has been entirely remodelled as regards fences; the many old ones were eradicated, and new ones planted of White Thorn, and the farm is now divided into eight large regularly shaped fields; whilst before, it consisted of something like three times that number of enclosures. Many ponds and old pitsteads have been filled up, and there are now none on the estate, except two small ones, which are required for watering places. The ditches likewise have all been drained and filled up. Of these new fences, those which have been planted longest are but three years old, and are already what may be termed good sheep fences; and by the time they are five years old, will, probably, be fit for any purpose. Generally speaking the Quicks have been planted in a perfectly straight line, six plants to a yard, or in other words, 6 inches apart. This mode of planting seems to make a better fence, that is, a closer and thicker one (at the bottom especially), than when the Quicks are placed alternately in two parallel lines.

We may now proceed to notice more particularly the crops, and the general cultivation and management of the farm. The rotation commences (say), first year with Oats; 2d, Potatoes or Turnips; 3d, Wheat; 4th, Clover; 5th, Grass; 6th, ditto. Sometimes, however, the 4th year is Barley (after the Wheat); but in either case the three following years the land is laid down with Clover and Grass seeds, sown on the Wheat or the Barley the previous spring, and is then broken up again for Oats. This may be termed the Lancashire course, as it is the one now generally adopted, though perhaps with some little variation; at all events it is the practice about here. The following is the state of cultivation at the present time; Oats, 15 acres; Potatoes, 17½; and Turnips, 4½; Wheat, 20; Barley, 4; Clover, 18; Grass, 19; homestead and garden, 2; total, 100 acres.

The Oats are generally sown on one good furrow, which is all the tillage the land receives, save harrowing when first broken up for that crop. Five bushels per acre are sown at the latter end of March or the first week in April; and the crop generally averages 70 bushels per acre. Like all other grain crops on this farm, the Oats are sown with a drill machine; the crop requires no weeding, the ground having been made perfectly clean when laid down to Grass.

As soon as the Oats are harvested the land is fallowed or "skimmed" for the next year's crop—Potatoes. In that state it lies all winter, and early the following spring is grubbed or scarified and again ploughed; it is then well harrowed, and this brings it to a sufficiently good tilth and clean state, so as to allow of the next process—drilling, and the Potatoes are then planted. The quantity of manure used for this crop (Potatoes) is 20 tons per acre, and consists of horse, cow, and black manure (night soil), in equal proportions. The produce, including both large and small, averages about 250 measures of 90 lbs. each, per acre. The sets are placed from 8 to 9 inches apart, and the drills are 35 or 36 inches wide. This great width of drill is considered necessary, for the purpose of thoroughly working and cleaning the land, without interfering with the crop. When the drills are small, and the crop heavy, like the one above mentioned, a large portion of it becomes unmarketable by its exposure to the atmosphere during growth. This is avoided when there is sufficient soil, and the land can be constantly and thoroughly worked through summer. At the time of getting up the Potatoes, the ground is well forked, and the weeds carefully picked out, which, together with the tops, are burnt and spread over again.

We now come to the following crop, namely, Wheat. The Potatoes having been cleared off the land, the harrows are first used to level it, and to root up any remaining weeds; after this the plough goes over it once, and buts are formed about 15 yards wide. Then comes the sowing, which, if the weather permits, is done about the first week in November; the seed sown is 2 bushels per acre, and the average produce of the crop on this farm is from 45 to 50 imperial bushels per acre.

The succeeding crop is generally Clover, but, as already stated, Barley is sometimes sown after the Wheat. When such is the case, the land is ploughed or "skimmed" over as soon as the Wheat has been cleared off—immediately after if possible—as it is found to destroy the weeds much better. It thus remains fallow until the following spring or beginning of March, when the land being dry enough, it is well harrowed; it is afterwards ploughed again and "butted-up," and the seed sown about the usual time, the first week in April; 3 bushels per acre are sown, and the crop averages 50 bushels in fair seasons.

The Clover crop is, of course, sown on the Wheat or the Barley, the previous spring, *i.e.*, the latter end of March or first week in April. The following kinds and quantities of seed are sown per acre:—6 lbs. red Clover, 3 lbs. white Clover, 2 lbs. Rib-grass, 2 lbs. Trefoil, and ½ bushel Pacey's perennial Rye-grass. The crop is generally mown twice in the season, and afterwards eaten off with sheep; the first crop, if a fair one, will be nearly 3 tons per acre; the second, half that weight. The two following years this same ground, which we have already stated lies three years in Clover and Grass, is manured in spring each year with guano at the rate of 2½ cwt. per acre. It should also be stated that when a Barley crop is taken after the Wheat, and before the Clover, the same quantity of guano is sown on the Clover, as a compensation for the Barley crop. To conclude our notice of the culture and management of the various crops, it may here be stated that about 35 or 36 acres have been marled within the last seven or eight years with 128 cubic yards per acre. For this Mr. Lathbury recently obtained a prize from the Manchester and Liverpool Agricultural Society, having previously obtained prizes for draining and eradicating.

There is no stock kept constantly on this farm, but occasionally in autumn the aftergrass is let to Liverpool cattle dealers for the pasturing of sheep which have just arrived in town, and are intended for the market. There are of course horses kept for the farm work, and four is found to be the requisite number; though probably 30 acres more might be worked with them. As it is, however, these horses are constantly employed, and as they are at all times in excellent condition, it may be worth while shortly noticing their management. I find, then, that their provender consists of Oats, Barley, and bran, in the proportion of three sacks of Oats to one of Barley and one of bran. The Oats and Barley are first ground together and then mixed with the bran. Each horse receives from 60 to 70 lbs. per week of this mixture, and in addition thereto they get either boiled Potatoes or Turnips and Wheat chaff, which are all mixed up together and given to them warm. It is difficult to state the exact quantity of Potatoes and chaff used, but the proportions necessary to produce the requisite consistency (which is rather stiff) is easily ascertained in practice. When there are no Potatoes and Turnips to give them they receive an additional quantity of Barley, and this is boiled. The horses are fed three times a day, viz., at 6 A.M., 12.30 P.M., and 6 or 7 in the evening. After the hay harvest they are turned out to Grass for a season, both night and day, at which time no provender is given to them. The stables are two miles and a half from the farm, which is of course an inconvenience; it has, however, the advantage of bringing the horses constantly, and especially at nights, under the inspection of their owner, who wisely takes care that every attention is paid them. Successful

stable management is one of the first considerations in rural economy. Some pigs are kept on this farm for private use, but there is nothing respecting them which need be noticed.

Where so little stock is kept, it will very naturally be asked, whence comes that large supply of manure necessary for such a course of cropping as that pursued on this farm? This is easily explained: any description and any quantity can be had in Liverpool, which town is not more than two and a half miles distant from the farm. For this manure, the prices at the present time are—for horse and cow manure, 6*s.* per ton; and the black manure or night-soil, 1*s.* per square yard, or about 1*s.* 2*d.* per ton. The quantity purchased annually for this farm is 20 tons of horse, cow, and black manure, in equal proportions, per acre, for Potatoes and Turnips; and 2½ cwt. of guano, per acre, for Clover and Grass roots. This last mentioned valuable manure is nowhere more prized than by the farmers of this neighbourhood; and whilst it was never more sought after than at the present time, it has become exceedingly scarce, and every day becomes more expensive. The price is now 13*l.* per ton for Peruvian, and 10*l.* per ton for Bolivian, which is nearly 50 per cent. dearer than it was at this time last year.

Here we conclude our notice of this well-managed farm, and, in doing so, it may not be inappropriate to glance at the state of its farming operations and appearance of the crops at the present time. All the seeds are now sown except Turnips, and in a few days Potato planting will be finished. The Clover and Grass roots are looking well, and will, no doubt, be good crops, if the season proves favourable; but rain is now beginning to be much wanted everywhere. Wheat is looking well on this farm, perhaps better than many of the crops in the surrounding district; for, upon the whole, the appearance of this crop is not so satisfactory as could be wished; in some places it looks sickly, and seems to have lost its roots, either by the wireworm or some similar cause. There has, however, been a great deal more Wheat sown this season than there was last, and, upon the whole, we have much reason to be thankful at the present time for our agricultural prospects. *Thos. B. Ryder, Surveyor, &c., 2, Elliot Street, Clayton Square, Liverpool, April 17th.*

AGRICULTURAL METEOROLOGY.

(*Continued from page* 259.)

It appears to me that the perusal of this table suggests some very interesting inquiries. *What are straight winds?* For 63 hours, notwithstanding the steady fall of the barometer, the wind continued fixed almost in one quarter; South-east, South-South-east, South; and yet there seems to me to be no fact more clearly demonstrated than that this was a Rotatory and Progressive Storm. Again, *why was not this wind more violent?* How did it arise that the force of this South-easterly wind did not exceed a strong breeze in Dublin, at a time when in England it was blowing a strong gale at South-west and West-south-west? Again, *why should the temperature at Dublin have been so much higher by several degrees whilst the wind was Easterly*, which is a cold quarter, *than it was when the wind shifted round to the Westward*, which is a warm one? Each of these questions would offer interesting materials for discussion, and to each of them the Rotatory Theory would give a satisfactory solution.

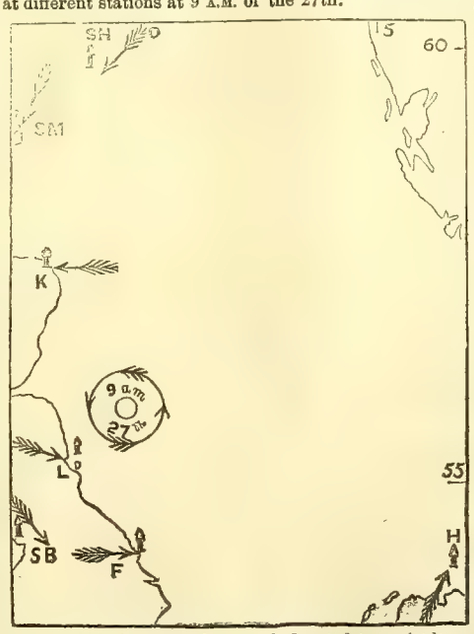
H. L.

But the reason which induces me to give in full this table of the Dublin observations is that your columns are dedicated to promote the interests of agriculture, and are chiefly studied by agriculturists. And I would ask who are more dependent on the vicissitudes of weather than they are? Though to the sailor a wet jacket may be less pleasant than a dry one, yet rain or damp is to him but a secondary object, provided he has but a sufficiency of wind. But to the farmer, with the fortunes of the entire season depending on the change which a few hours may bring in the elements, of what vital importance is it to elucidate the principles on which those fluctuations of the barometer may be explained which are to warn him of the approaching change. It is therefore to the *frequent record of barometrical readings* that we must trust for the indication of the rate of travelling of these phenomena of which they are such certain guides. If we examine the above details taken at Dublin during the 26th August, we shall perceive that they give us an observation for nearly every four hours; that at 1 P.M. the barometer was still falling and the wind still S.E.: at 6 P.M. it was rising and the wind had shifted to the East: at 10 P.M. it had risen still more, and the wind had shifted to the S.W. Had the observations at all the other stations been taken thus frequently, we might have traced this STORM'S-CENTRE along its route hour by hour, as accurately as one can trace on a distant railway the progress of a locomotive by its jets of steam. With our network of electric telegraphs over these islands, and observations taken regularly at some of our principal railway stations, what a loss of life might be avoided in the case of vessels shipwrecked in bad weather, as recently was the *Tayleure*, shortly after leaving port; what an amount of damage might be saved to the farmer from his ruined crops left unhoused in the promise of the morrow's brightness! Let us conceive in the case of this very deluge of rain, which fell in England during the 25th and 26th August, what an amount of corn might have been wind-mowed in a few hours, which was irreparably soaked by remaining unprotected on the ground. Why should not we investigate closely the nature and causes of these rotatory and progressive winds, and learn to prognosticate their approach? But how is this to be effected, so long as we content ourselves with barometrical observations, alas, too like angels' visits, very few and very far between?

Having been enabled, from a comparison of the observations taken at *Dublin Observatory* and the *Bishop's Lighthouse*, to fix so accurately the position of the storm's centre at noon of the 26th, we might without much hesitation assign its position at 3 A.M. of that day to lat. 50 N., long. 10 W. (*i.e.*, the parallel of Scilly), and thus measure the area which was affected by this storm in its passage, as at that time the wind at Heligoland was south, with a falling barometer. The distance from the storm's axis to Sumburgh on the one side and to Heligoland on the other being compared with the fall of the barometer (see Diagram in page 259), we may reasonably infer that the barometer was affected as far as Munich, and possibly even to Reikiavitz in Iceland.

I annex a diagram showing the direction of the wind at different stations at 9 A.M. of the 27th.



It would be improper in a work devoted to agriculture to discuss nautical topics. The inquiry into individual storms having arisen from the interest excited by the *Bengal's* life-boat being washed ashore off Portland, I may be permitted to state that at the very time (viz., noon of the 26th) that she encountered this misadventure with a hurricane at South-west, the ANNIE JANE lost her masts with the wind at north-east off the north coast of Ireland. *F. P. B. M.*

(*To be concluded in our next.*)

THE MANAGEMENT OF FORWARD EWES AND LAMBS.

(*Concluded from page* 259.)

In the management of this kind of stock, or, indeed, of any sheep, it is advisable to have a catch coop in the field, for the purpose of driving the sheep into when required to be examined or drafted, either for treatment in disease or for the market; and in order that the coop may be clean and not contaminated by constant use, it should either be continually removed, or else kept supplied with litter, such as refuse straw, as cleanliness requires; after being used a given time the bedding will be converted into manure, and may be removed for that purpose.

I now propose to make a few remarks upon the state in which it is best to give certain feeding materials. When Peas are given to lambs it is desirable that they should be cracked, not ground into meal; for in this state it is not only objectionable to the lambs, but very wasteful, particularly in damp weather, as much of the finest portion becomes clotted and distasteful, and, consequently, useless for the purpose intended. It is, therefore, only necessary that the Peas should be broken, and this only up to the time of the lambs being two months old, for after that period they will readily eat them whole; and this, in fact, is the only state in which they can be given without some amount of waste, with this drawback, however, that those grains which may be dropped outside the troughs will be liable to vegetate amongst the succeeding corn crop.

Good hay may be given to ewes and lambs, either entire or cut into chaff. I prefer that fatting sheep (and particularly lambs) should receive their hay in the ordinary state, for they will then have the opportunity to select the best, and leave a portion, and afterwards it may be removed and given to the ewes or other stock; whereas if the hay be given in the state of chaff, the lambs cannot so readily select the best and the Clover leaf portion, nor can it be made so available for the removal of the residue to other stock.

I would here observe that the declared object of parties who advocate the feeding of stock with chaff is to mix it with cake or corn; and when it is given alone, it is intended to prevent waste, and induce the animals to eat the whole without distinction or selection. I think the former mode of mixing oil-cake or corn is objectionable, for I find the stock are apt to rout the chaff out of the troughs in searching for the better and more palatable food; and the latter mode of giving chaff alone I consider without advantage; for if we take the loss of good hay when given in the ordinary state at regular intervals, and in proper quantities, it will not amount to more than 1-20th part, or 1 cwt. in a ton; and it must be remembered that chaff is not always given without some loss, particularly in windy weather, when it is often blown out of the troughs. I will, therefore, put the loss on chaff feeding, at half a cwt. per ton, which will only leave an actual difference or loss against feeding in the ordinary state of 56 lbs. to the ton, and the wasted portion must be considered of some value to plough in as manure. I will, however, place the value of loss at 2*s.* per ton, which sum will not pay the cost of converting the hay into chaff, with other extra charges. I am willing to admit that chaff made of inferior hay is made more palatable for store sheep, and that in some instances they may be induced to eat a larger portion of the hay as chaff than they would if given entire. But for lambs, or fatting sheep, it can never answer a good purpose to offer them hay in the form of chaff which they would otherwise refuse as ordinary hay.

The selection of feeding materials is a matter of the greatest importance; for instance, it is commonly considered that white Peas are the best for feeding lambs, but my experience has taught me that the grey or Maple varieties are much better than the white. I had an excellent opportunity of proving this a few years ago; being out of the grey Peas, which I usually grew for feeding, I was induced to purchase some of the best white boiling Peas which I could get, being informed that they were the best sort for the purpose. About a week after I commenced feeding with them, my lambs, which had heretofore given good satisfaction, were now complained of by the butcher; nor did they die well, and in good condition, during the whole time they were eating white Peas. But, after a while, I fed them again with Maple Peas, when the lambs soon regained their former good quality, and maintained it until the end of the season. These facts, coupled with the chance which I had of seeing the lambs dead every week, were conclusive to my mind, and I have not since been induced to use White Peas for feeding lambs, nor should I do so if I were enabled to obtain them at a greatly reduced price. It may be considered that the astrigent property of the grey and Maple Pea acts very favourably (particularly in connection with oilcake) in the feeding of lambs, by conducing to the production of a good proportion of muscle and flesh, which is really essential in making up lambs of the best quality. Beans are not good for feeding lambs, as they contain the atringent property in excess of the Peas, and I have known, by their use in feeding, that the flesh has been made so hard as to render it unsaleable as lamb.

There is also a vast difference in oilcake for feeding purposes. The home-made and some of the Marseilles cake are very good for feeding ewes and sheep stock in general; but the superior sort of American cake is certainly the best for feeding lambs. This cake, when good in quality, always makes a higher price than other sorts of oilcake; yet it is much cheaper for the feeding of lambs, if we measure its value by results. In fact, I do not hesitate to state that so far as cake and corn are concerned, that American barrel cake and Maple Peas are the perfection of lamb food.

In the growth of Grasses intended to produce hay for feeding this kind of stock, it is desirable to select white Dutch Clover with Trefoil, and a small portion of Italian Rye-grass mixed for the lambs; and broad Clover with Trefoil, and Italian Rye-grass for the ewes. The former being intended as hay for the lambs, should be cut very early indeed; it will then, if well made, contain the greatest amount of nutrition; and this is especially necessary, because young lambs cannot under any circumstances be expected to eat more than a limited quantity. It is, therefore, requisite that the hay should be of the best quality; for not only will they be induced to eat the greatest bulk of the material, but, at the same time, the largest possible amount of nutrition will be conveyed into the system. The hay best calculated for feeding the ewes is, without doubt, the same as has been recommended for the lambs; but it often happens that a sufficiency is not grown to feed both with the same sort during the whole season. It is usual to grow the Clovers alternately, therefore the supply of either description is somewhat limited, and the broad Clover and Rye-grass hay is commonly resorted to for the feeding of ewes.

It has been previously recommended to feed the ewes with a certain quantity of oilcake each per day; it was, however, omitted that they should receive half a pint of Beans also, in addition during the last month of their fattening; this will render the flesh more firm, and they will sell better in the market, inasmuch as

the great objection to ewes which have been fattened during the time they suckled their lambs being that they are usually deficient in firmness and quality of meat.

I shall conclude this paper with an observation as to the great advantage of high feeding for the ewes, in which the lamb is also found to participate, owing to the extra quality of the milk induced by feeding upon highly nutritious materials, verifying the old saying, "a fat ewe makes a fat lamb."

Home Correspondence.

House-feeding Sheep.—Quite accidentally, in a local paper, I met this day with the request of Major M'Inroy that I would state how the small lot of hoggets were fed up to the time of their being placed upon boards: this with pleasure I comply with, and may inform him that they had all the sumptuous fare they could meet with upon very plain Grass land, at an altitude of 1100 feet, and this was all I ever gave them prior to their being housed, my best pastures being reserved for a dairy of about 30 cows. I am not aware that Major M'Inroy's calculation of the cost of my house-feeding the hoggets is incorrect, but I think I have given every particular appertaining to the subject, and, consequently, will not further enlarge; but must just add, that my opinion as to the "dismal price" his hoggets obtained, after house-feeding charges, remains unaltered. And to this time I do not know the month, or months, in which they left him, though I have given the dates on which mine quitted me, as also the butcher's address who had them. Rely upon this truth; both he and I act injudiciously if we permit Leicester blood in our sheep; the Cotswold is larger, and far more hardy, and much more suitable for us to cross our mountain flocks with. His breed, at about the same age as mine, returns 30*s.* 3*d.*, whilst mine, possessing a higher amount of gratitude, gives me 43*s.* 10½*d.*, leaving his a large margin for improvement. *G. W. Fowler, Prince Hall, Dartmoor.*

The reason why it cost so much for threshing is because I used a hand threshing machine. I was told that two persons could turn it; but when I got it to Colne, there wanted six Colne men, and then the work, they said, was so hard that they had to have elevens (luncheon) three or four times a day, and fours (tea-time) about as many. Then there was to board and lodge the manager, &c., &c. "This is the way the money goes." Then, again, the 30*s.* for hoeing—12*s.* of that was for hoeing after last harvest. *J. D. Piper, Colne Engaine, April*, 1854.

Paper and Bread.—In your No 15 are two articles on materials for paper, in one of which (p. 238), the writer suggests sawdust. That would hardly give length enough of fibre for the texture of the paper; and would do little more than add thickness and weight, without strength. A more fibrous material, refuse bark from the tan pits, was tried 10 years ago; but I have never learned with what success. It would appear to be practicable; and I should think the supply would exceed 50,000 tons yearly. Does Mr. Patterson know anything of this?—The article on cheap bread (p. 243), and the experiments now making by a French company, producing 120 loaves per sack instead of 96—with the remarks thereon by Prof. Pepper, in your Newspaper of the same Number, p. 118—call to mind the old trick of boiling the water into paste with part of the flour, before making up the dough; by which means a much larger quantity of water is retained; of course without advantage to the nutritive power, though with injury to its keeping quality. But so many distinguished French names are quoted, in approbation of the new process, that the secret would appear to lie deeper than mere absorption of water. *J. Prideaux.*

An English Farmery.—In the erection of a farmery there may be a great improvement made in the connections of the buildings, and their relative proportions and position. I am persuaded of an advantage to be derived from judiciously adopting better arrangements for these purposes than are at present in general use. The day may not be distant when the profits of the agriculturists, like those of the manufacturers, will depend more upon the perfection of their machinery than extent of occupation. When the best principles are acknowledged, then all new buildings could be made according to the agreed proportions, so that the whole, whether in detail or as a whole, could be combined and scientifically completed. A farmer requires dwelling-house, barn, root and chaff-houses, as well as other houses and machinery. The dwelling I shall not now notice. The barn might be so placed that the dressing chamber would be elevated for the various purposes of loading, &c., being done easily; the root stores to comprise a separate place for each kind, and at harvesting stored at such an elevation of lodgment, that its future movements, to convey it through the washing, cooking, and mixing operations, may be facilitated, chiefly by means of a correct arrangement of the levels, giving to the same a tendency to move onwards; for every movement should be in connection with suitable contrivances, that the whole may co-operate easily. The inner floor of the mixing box might perhaps be in a line with the mangers. The best situation for a tank or tanks is, I fear, a matter of dispute, and unless placed on the premises to meet very particular disadvantages of locality, would be much better elsewhere. We need tanks in the fields as numerous as watering-places; indeed, field tanks may soon supersede all home filth-holes. When drainage pipes are manufactured in the "taper form," then our liquid manure, in numerous localities, might be conveyed to field tanks at much less expense than it is at present by man, horse, and cart, and made available when most required at any season, and in all weathers. *T.*

Societies.

Agricultural Improvement, of Ireland, *April* 4.—*On Green Cropping.*—Mr. Ball proceeded to read a paper on this subject, from which we make a few extracts. 1st, in reference to the *purchase of artificial manures*:

"I may mention that a year or two ago I purchased a quantity of one of these artificial manures from a quarter in which I had every reason to suppose I should be supplied with a genuine article. I was willing to take it on character, and did not, at first, propose or even think of an analysis; subsequently, on the urgent advice of a friend, I determined to send a sample of it to our chemist, who pronounced it not to contain one particle of the substance it professed to be—namely, superphosphate of lime—and I ascertained the actual mercantile value of the substance at the then price of bones, to be from 2*l.* to 3*l.* 10*s.* per ton, whereas the price I was to pay for it was 7*l.* Upon bringing these facts under the notice of the agent of the vendor, and presenting him with the analysis, he attempted to question not merely its accuracy, but his statement went to this, that there was not one word of truth in it. Under these circumstances, the committee of the society determined to have the accuracy of their chemist further tested, and for that purpose submitted samples of the substance to Professor Way of the English Society, and Professor Anderson of the Highland Society, by whom, it is hardly necessary to add, the entire accuracy of the first analysis was placed still further beyond question. As a general rule, then, insist on seeing a properly certified analysis before purchasing, no matter from whom. Next, as to the selection of the manures for this season, and their method of preparation and application. Guano, of which we have lately heard so much, is not likely to be generally within the reach of farmers for the ensuing Turnip season, and I think it may be safely laid down that with the prospect of an increased supply of other manures of considerable fertilising power, which the rumoured deficiency of guano has, unquestionably stimulated, that we may safely reduce the quantity hitherto generally applied; and, further, I would urge my own experience of the last season, that under no circumstances should it be omitted to mix an equal weight of gypsum with the guano immediately on its being thrown out of the bags. As a general formula, I have found that a mixture of 2 cwt. guano, 2 cwt. of gypsum, and 2 cwt. of superphosphate (last season I used Lawes', and had every reason to be satisfied with it), mixed with from 18 to 24 cwt. of ashes, in conjunction with about 20 to 25 tons of farm-yard manure per Irish acre [the Irish acre is 1.86 statute acre] is a manuring that, upon most lands, should produce a full crop of Turnips. For Mangolds the farm-yard manure may be increased to 30 or 35 tons with advantage, and say 2 cwt. of common salt added to the above artificial manures."

2d. *On the Preparation of Land.*

"I must mention my experience of a late and imperfect attempt at the system of autumn cleaning, of which so much was said here in the course of last year. I was only able to accomplish the cleaning of about three or four acres when the weather broke, and I was for some time undecided whether to wait for a return of fine weather to finish even a part of my work to my satisfaction, or, as I eventually found myself obliged to do, to start the ploughs and make a regular winter fallow, while yet there was time. It was well for me I did so, as by that means I accomplished the turning over of about 12 Irish acres of fallows before the early and severe winter, with snow and frost, with which Providence favoured us last season, had set in, leaving me, however, about three acres of stubble still unturned; and I can only say I would not exchange the unquestionable advantage of the cleaning on the one three acres for the deterioration on the other three that lost the invaluable manuring of last winter's snow and frost, and which might have been three times over ploughed in the time that my men and horses were at work at the autumn cleaning of the other part. This, however, I freely admit, was my own fault, for not having commenced sooner, and must not be fairly visited on the system, although it cannot but be admitted that at best it is attended with some risk, and that not only with the best intentions, but the best exertions to back them, that you may suffer more by a sudden break in the weather than (at least upon strong land) you can ever gain by the saving of the additional spring work. What the acreable money value may be of last winter's frost and snow on the fallows of this country, I cannot say, and will leave every practical man who hears me to estimate it after his own fashion; but of this I am full sure that I would not now exchange an acre of winter fallow that had received a good deep furrow last October or November, notwithstanding a certain portion of Scutch Grass and annual weeds may be beginning to peep through it, for an acre of the same land as well worked on the surface and cleaned as Bental's broadshare and the most improved of grubbers could render it, but which has not received a winter furrow in proper time, and has lost the precious manuring of the last winter's frost. I have made these observations not because I suppose, for a moment, that it is held for a general rule that the winter furrow should be sacrificed to the autumn cleaning; but, on a late occasion, it was mentioned by Mr. Harkness, that a main feature of the system, as followed by Mr. Tenant—who has been, I believe I may say, one of the earliest and most successful promoters of it—was, that having accomplished the surface-cleaning of the land by one or more applications of the grubber, followed by the harrows, &c., that he then left the land for the winter, and, as I understood his observation, did not wish to use the plough until the following spring; not for a moment doubting the applicability of this system upon a light soil, and with a severe Scotch winter, I can only say that such management would never answer in Ireland, where our winters are generally green from one end to the other, and the amount of moisture that falls keeping up the vegetation of small weeds and grasses almost without interruption."

3d. *On the Distance between the Plants*:—

The following Table is the result of experiments on the effects of distance between plants upon the weight of crops:—

There is an element in the matter which should not be overlooked—namely, the comparative time occupied on each and every application. I am not furnished with any table to show the exact time occupied in the earlier operations, but in the raising of the crop, preparatory to the weighing (which took place on the 4th Dec. last), I noticed the marked difference in the time occupied in the topping and tailing of the different drills, and leaving them in readiness for the cart that was to carry them to the weighing machine, and, on taking time accurately, I found the following to be the result:—

Name of Crop.	Distance in inches between the drills.	Distance in inches between plants.	Weight of roots on one drill, 19 perches in length. C. Q. lb.	Weight of roots per acre Irish. T. C. Q. lb.	Average weight of each root grown. lbs.	Weight of tops on 19 perches of drill. C. Q. lb.	Weight of tops per acre Irish. T. C. Q. lbs.	No. of roots grown on 19 perches of drill.	No. of roots grown per acre, Irish.	No. of roots that should stand on 19 perches of drill.	No. of roots that should stand on one acre, Irish.	Difference, + or —, between the last column and the number of roots actually grown.	Quantity and description of manures used per acre, Irish.

„ 9 „	... ...	20	„
„ 6 „	... ...	26	„

The early operations of hoeing and cleaning were in at least a similar proportion in favour of the large roots, even the simple matter of filling a cart in the field was true to the same principle. Again, on examination of the ground after the different lots were raised, while the places lately occupied by the 18, 15, and 12-inch drills were clean and without the appearance of a weed, the 9 and 6-inch drills, upon which I can safely say a far greater amount of time and trouble were expended in cleaning and hoeing, were thick with Chickweed and other weeds of various kinds; and after all my care and trouble, I should have been sorry indeed to have seen my whole field in the condition these several strips were left by the small-root and close-growing system. The experiments were made upon a farm at Malahide, lying upon a lime stone gravel—limestone being the geological formation—and yet the surface of the soil varies very much in depth. In the field where these were sown the limestone comes up in places to within 3 or 4 inches, or perhaps 6 inches of the surface; in other parts it is further down, but, on the whole, it is what is generally called an open bottom. It is a dry field, with considerable depth in some places of lime soil, with a mixture of sea-sand. On the whole, it is above the average of the class of soil that one would choose to grow green crops upon; but it was very much out of condition, and run out, and this accounts for the quantity of manure that I used."—Mr. Sproule said: "I do not impugn the accuracy of anything which has been done, but I maintain that it has not been done in a manner to test, in the best way, the difference between thick and thin planting. When the intervals were reduced from 18 inches to 6 inches, a corresponding reduction of some sort should have been made in the distance between the rows. It is not fair to test the matter without varying the width between the rows as well as between the plants; and an experiment carried out in the way this has been will not satisfactorily determine the question. No doubt it is valuable, so far as it goes, upon this kind of information, but it does not satisfactorily determine the question. There was one fact which I was rather surprised to hear—namely, that the effect of close growing is to make the plants run to seed. I take that as a novel fact; but there is one way in which a considerable number of the plants running to seed in the one case more than

in the other may be accounted for—in the one case the number of the plants is nearly double, and of course a greater proportion will run to seed."

CHEMICO-AGRICULTURAL OF ULSTER, *April 7*: *Experiments in Feeding with Fermented Food.*—Mr. Andrews, by whom, at the request of the council, a series of careful experiments in feeding cattle and pigs with pulped and fermented food, on the plan proposed by Messrs. Bushe and Barter, gave a statement of the results obtained in the comparative trials. Mr. Andrews' report of the progress of the experiment proved the correctness of the opinions which had been expressed at former meetings, with respect to the doubtful value of the proposed alteration in the methods of preparing roots for feeding. He stated that one fact of great importance had been ascertained, in the course of the investigation—viz., that Mangolds were much superior to Turnips in pig feeding; and that, while the farmer should give Turnips to his black cattle, he should keep the Mangolds for his pigs.

Report on Guano.—Dr. Hodges said that, since the last meeting, samples of guano, offered for sale in Belfast, had been analysed; of these only one was of good quality. The genuine sample had been forwarded by Mr. George Ash, of Waring-street, and its value, calculated from the selling price of its ingredients in the manure market, closely approached the price at which it was offered for sale. One of the samples of spurious guano which he had analysed had been offered for sale to a merchant, a member of the society, who was properly desirous that he should not be the means of victimising the farmers. The following was its composition, and, also, that of the sample forwarded by Mr. Ash. 100 parts of each, respectively, contained—

	Spurious Guano.		Genuine Guano.

Miscellaneous.

Improvements in Drying Malt. By W. Walker, Park Malt Kilns, Marlborough Street, Leeds. Patent granted April 4, 1853 (No. 801).—This invention consists in constructing an oven under the kiln, within which is a fireplace suitable to burn coal to heat the oven. Between the fire and the roof of the oven, metal or other flues or tubes are placed to be heated, and through these air is passed from the atmosphere to the drying-kiln. When wanted to dry with as little fire as possible, and pure air is not required, the fire-doors are left open and the dampers closed, which lets the air from the oven pass to the drying kiln. Air is also passed over the oven to the kiln. Cold air-passages are also employed for reducing and regulating the temperature. *Mechanics' Magazine.*

Experiments on Weeding.—1. Seven acres of light gravelly land were fallowed and sown broadcast; one acre was measured, and not a weed was pulled out of it; the other six were carefully weeded. The unweeded acre produced 18 bushels, the six weeded acres averaged 22½ bushels per acre—a gain of 25 per cent. 2. A six-acre field was sown with Barley in fine tilth, and well manured. The weeding, owing to a great abundance of charlock, cost 12*s.* per acre. The produce of an unweeded acre was 13 bushels; of the weeded, 28 bushels—difference in favour of weeding, 15 bushels per acre, besides the land being so much cleaner for the succeeding crop. 3. Of six acres sown with Oats, one acre, ploughed but once and unmanured, produced only 17 bushels; the rest, ploughed three times, manured, and weeded, produced 37 bushels per acre. Of this increase, at least 10 bushels may be attributed to the weeding, and 10 to the manure. *Journal of the Bath and West of England Society.*

Calendar of Operations.

APRIL.

SOUTH DEVON, *April 24.*—The weather having been so very favourable for farming operations has enabled many to complete their Barley sowing much earlier than usual; and although we have been and are now suffering from easterly winds, the showers of rain which fell during the past week already show their beneficial effects. The young Barley is coming up well and looks healthy. Oats also appear very promising, and the Wheat plants, lately in many places looking so thin and delicate, are improving much, notwithstanding the want of warm and genial weather. The principal farming operation at present is the preparing for and sowing Mangold Wurzel, and a splendid time we have had so far. It is full early to speak of the Potato, but, judging from the garden culture, appearances are very favourable. Orchards are now claiming much attention, and certainly bid fair to be productive of a good crop of Apples; however, this is a crop depending so much on the weather, that it would be quite absurd to predict anything beyond the present time. Prices of all agricultural produce still continue well up. Store cattle may be quoted at 45*s.* per cwt.; fat cattle, 60*s.* per cwt.; sheep, from 6½*d.* to 7*d.* per lb. Corn as follows:—Wheat, 84*s.*; Barley, 38*s.*; and Oats, 28*s.* per quarter.

Notices to Correspondents.

COW: *S G.* A collar so made that she cannot turn her head aside to the extent needed will effectually hinder her.

FENCE AGAINST PIGS: *R F.* We know of no remedy which will not occur to "R. F." himself. If he has to keep the fence, it must be strengthened and thickened by him until it is efficient. What is the nature of the present fence? Strong hurdles of close enough build will be sufficient, if the evil be but temporary.

TIMBER: *Richmond & Chandler* ask how young Fir trees, cut now, may safely be made useful as roofing timber on farm-buildings.

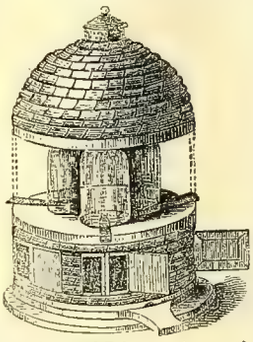
SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, DICKSON & SONS, 16, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

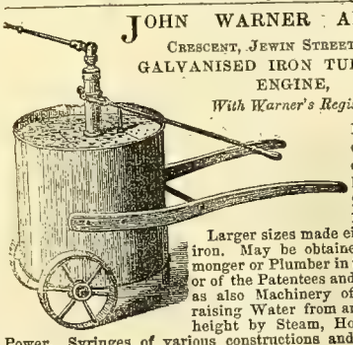
PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARD EN ENGINE,

With Warner's Registered Spreader



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London, Manufacturers of FIRE ENGINES, GARDEN ENGINES, PUMPS, and SYRINGES.

No. 32.—Conservatory Pump, with Warner's Registered Spreader.—Price, 27s. 6d.
No. 11.—Garden Engine, with Warner's Registered Spreader and Wrench.—Price, 3l.; with iron pail, 3l. 12s.
No. 14.—Patent Conservatory Pump, with Warner's Registered Spreader.—Price, 2l. 13s.; with iron pail, 3l. 5s.
No. 32.
No. 11.
No. 14

Brass Syringes of all descriptions, from 8*s.* 6*d.* upwards. May be obtained of any ironmonger in town or country, at the above prices.

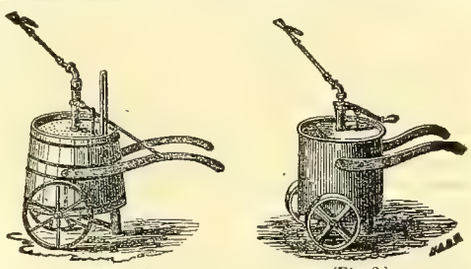
JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, or Drawing Rooms. Sheets of Engravings sent on application.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road, London.



(Fig. 1.) (Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws	30	feet	high	...	£4	10
No. 2	„	15	„	„	45	„	...	5	10
No. 3	„	28	„	„	45	„	...	6	18

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds	8	gallons, throws	25	feet	high	...	£2	15
No. 13	„	12	„	„	30	„	...	3	5
No. 11	„	16	„	„	40	„	...	4	0
No. 12	„	24	„	„	45	„	...	5	0
No. 14	„	30	„	„	45	„	...	5	18

A large assortment of every description of Garden Syringes Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

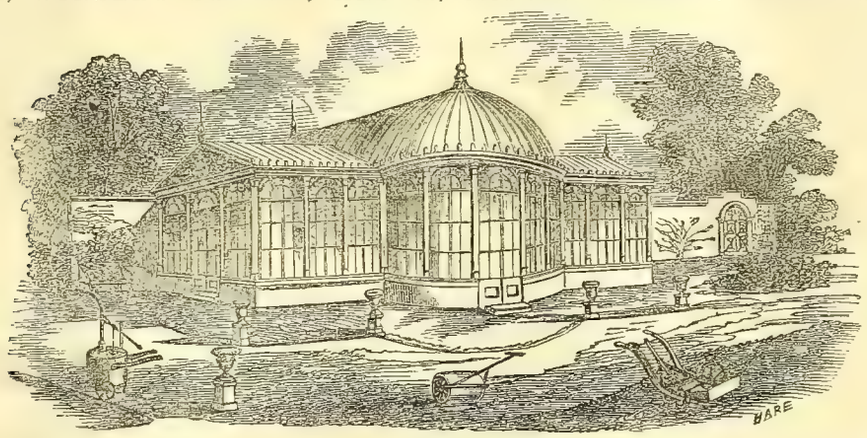
N.B. This price does not include carriage, package, or expenses of delivery in the country.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

IMPROVED WATERPROOF FLEXIBLE HOSE FOR WATERING GARDENS, AND AGRICULTURAL USES generally, at E. SPENCER & CO.'s, GENERAL WATERPROOFERS, 116, Fenchurch Street, opposite Mark Lane, London.

THOMAS B. LAWRENCE AND CO., ZINC MERCHANTS and MANUFACTURERS, No. 10, York Place, near the Orphan Asylum, Lambeth. Rain Pipes, 3-inch, 4½*d.* per foot; Eaves Gutters, 4-inch, 4*d.* per foot; other sizes in proportion; Perforated Zinc, 4*d.* per foot; Sheet Zinc, 33*s.* per cwt.,; Plumbic Zinc, 42*s.* per cwt.: Galvanised Iron, Corrugated or Plain. Lawrence's Fumi Porte; Patent Smoke Vents; Garden Lights, Frames and Glasses. Lawrence's Roses and Watering Pots. Wardian Cases.

MARQUEES ON HIRE.—A large Ball-Room fitted up with Chandelier Lamps, 100 Cushioned Rout Seats, floored and covered with Dancing Holland, and handsomely decorated, for 20*l.*; Balconies enclosed, 30*s.*; Awnings for Doors and Footpaths, 20*s.* Any portion of 1000 feet in length of Marquees to let for Horticultural Shows, and other purposes, on moderate terms.—R. RICHARDSON, 21, Tonbridge Place, New Road, London. N.B. One Circular Tent to Let, 100 feet in diameter, will hold 2000 people. Cheap Tents for Gardens and Cricket Grounds.

TENTS, MARQUEES, AND RICK CLOTHS.—Now on Sale, several second-hand Rick Cloths, Marquees, and Tents, of various sizes. Some of the Marquees are well adapted for Horticultural Societies. One 50 feet by 30, price 35*l.*; one 70 feet by 30, 50*l.*; and one 100 feet by 30, 65*l.* These are almost new, and quite ready for use. Small Tents for the Wars or Emigrants, weighing 12 lbs., price 25*s.* each, new and waterproof. Small Tents for Gardens, 30*l.* each.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

SUMMER HOUSES IN WOOD AND IRON for Gardens, from 50*s.* each, all made portable, so that they can easily be erected by any ordinary labourer. Drawings of 28 sent free. Small Rooms, 6 feet square, price 5*l.*, with doors and windows, and painted.—R. RICHARDSON, 21, Tonbridge Place, New Road, London. N. B. Maker of Iron and Wood Houses for Emigrants, drawings of 21 sent free.

SUBSTANTIAL POULTRY HOUSE 12 feet by 4, for 4*l.*, consisting of House 4 feet square, and covered Run for Fowls 8 feet by 4. The above is painted, and delivered free within four miles of London. Drawings of several sent free. Large enclosures for Fowls and Pheasants very cheap.

R. RICHARDSON, 21, Tonbridge Place, New Road, London.

N.B. The above are portable and can be erected by any ordinary labourer.

SECURITY TO PREMISES.

WIRE FENCING, 4 feet high, fixed on tops of walls, 1*s.* 6*d.* per yard run, including Iron Standards and all expenses of fixing. This Fence has been approved, in many instances, by the Police. It is almost invisible. Iron Wire Fencing for Hares, Rabbits, Cats, Dogs, Deer, Sheep, and enclosing Fowls and Pheasants, 6¾*d.* per square yard, in various widths, from 6 feet to 15 inches.—R. RICHARDSON, 21, Tonbridge Place, corner of Judd Street, New Road.

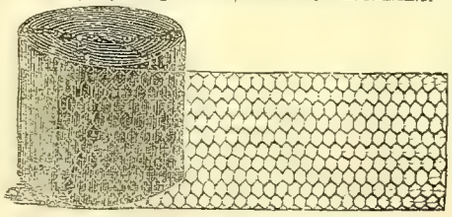
PIPE FRUIT, STRAWBERRIES, AND SEED BEDS.—New Twined Netting (tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; ½-inch mesh do., 2 yards wide, 6*d.* per yard. The Elastic Hexagon Garden Netting, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c., from fruit trees, flower or seed beds, 4½*d.* per square yard. Tanned Netting, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard, exactly the same as advertised by others at double the above prices. Coir or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* per yard. Lamb Net, 6*d.* per yard. Rabbit Net, 1½*d.* per yard, 4 feet wide; each edge Corded, 2*d.* per yard, suitable for fowl fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing against fowls, cats, &c.

The largest, cheapest, and best stock in the world, at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Islington, London. The Trade supplied. Orders by Post punctually attended to. Fishing Nets of all kinds in stock.

HALL'S GARDEN NETTING, the best protection against FROST, STORMS, OR SCORCHING HEAT.

GARDEN NETS, FISHING NETS, AND SHEEP NETS made by Machinery at very low prices. New Nets, 1½*d.* per yard. Old Tanned Net, 6*s.* 3*d.* per 100 yards. Nets to cover Pheasantries and for all purposes required.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.

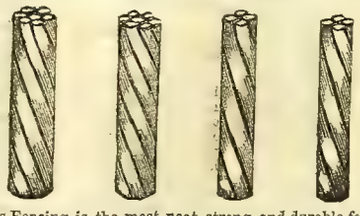


24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.

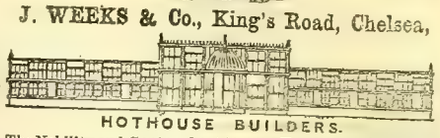
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard.
30 in. " 2 in. "	9*d.* "	6½*d.* "
36 in. " 2 in. "	10½*d.* "	7½*d.* "
48 in. " 2 in. "	1*s.* 2*d.* "	10*d.* "

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. FOX, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

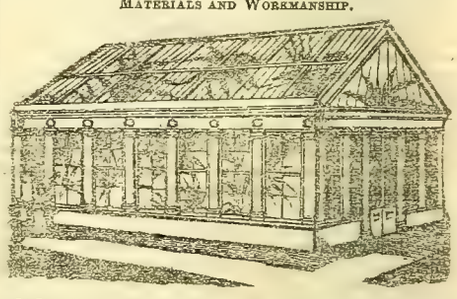
E. ELEY'S HOT WATER WORKS, and improved Hot Air Works, opposite the Eagle Tavern, City Road, London. Manufacturers of the various descriptions of HOT WATER APPARATUS for Heating Horticultural Works, Churches, and other Public Buildings, Mansions, Offices, Baths, &c., on the most Scientific principles. Manufactories requiring artificial heat fitted up with effective and economical apparatus by contract or otherwise. Old work taken down and remodelled. Architects, Surveyors, and the Trade attended to in any part of town or country.

E. E. being a practical and scientific workman defies competition. Parties by sending a rough sketch of their building can be supplied with the most improved Pipe Boilers, or any other description, with connection and piping fitted and marked with a plan, cement, &c. for joints, so that a gentleman's own tradesman or gardener can fix them.

N.B. Please to observe the Address. No connection with any other House in the Trade.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

Squares	6 by 4 and 6½ by 4½	...	...	...	13 6
"	7 by 5 and 7½ by 5½	...	...	...	—

Bee Glasses, Lactometers, Lord Camoys' Milk Syphons, Tiles and Slates, Wasp Traps; Plate, Crown, and Ornamental Glass, Shades for Ornaments, and every article in the trade.

HARTLEY'S PATENT ROUGH PLATE GLASS, for Conservatories, Public Buildings, Manufactories, Skylights, &c.

JAMES PHILLIPS AND CO., Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

Extract from *Gardeners' Chronicle*, April 21, 1854.

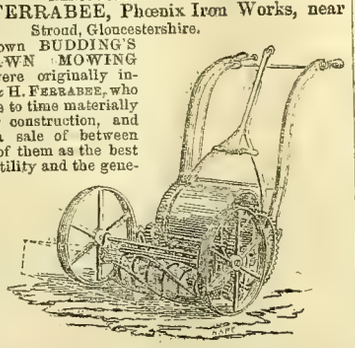
"The garden also supplied some Neapolitan Cabbage Lettuces, a portion of which had been grown under bell-glasses, which differ from the French cloche in having a ventilator at the top, in the shape of a neck or chimney, which can be left open or kept close as may be desired, by covering it over or not with another small bell glass, made for the purpose. The result of this trial has been very satisfactory."

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

THE IMPROVED LAWN MOWING MACHINE,

MANUFACTURED BY

J. AND H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.



The well-known BUDDING'S PATENT LAWN MOWING MACHINES were originally introduced by J. & H. FERRABEE, who have from time to time materially improved their construction, and can refer to a sale of between 4000 and 5000 of them as the best proof of their utility and the general satisfaction which they have given.

The Machines offered this year by J. & H. FERRABEE are superior to any yet produced, being perfectly adapted for cutting the Grass on Lawns and Verges, and between flower beds; while their strength and durability have been increased and their management simplified. Any person can use them effectually without the least practice. They can be adjusted to cut various lengths of Grass, and will produce a more even and uniform surface than the most skilful mower. The Grass is cut best when dry, so that a machine can be employed at the most convenient time to the workman, and more than double the work may be done with the same manual labour that is requisite with a scythe.

SIZES AND PRICES.		£ *s.* *d.*
Hand Machine, for One Man, cutting	16 inches wide	5 15 0
Ditto for Two Men,	22 ditto ...	6 10 0
Pony Machine,	28 ditto ...	10 0 0
Horse ditto	36 ditto ...	16 0 0

The Horse Machine will cut the longest and coarsest Grass usually met with on Lawns and Pleasure Grounds.

London Agents:—Messrs. BOULNOIS & SON, Baker Street Bazaar, Portman Square.

CLARKE'S PREPARATION FOR DESTROYING MEALY BUG, SCALE, THRIP, &c., without Injuring the Plants.

Report of the Horticultural Society in the *Gardeners' Chronicle*:—"Clarke's preparation for destroying Mealy Bug has succeeded perfectly; it has been tried on various plants, at different times, and has invariably answered."

In bottles, secured for travelling, with full directions for its application, on receipt of 5*s.* in postage stamps.

CHARLES CLARKE, Walham Green, Fulham.

FUCHSIA "TRENTHAM."

COLE AND SHARP, Aston Lane Nursery, near Birmingham, are prepared to send out the above fine new Seedling, for characteristics of which see previous advertisements. Plants 10*s.* 6*d.* each, with the usual allowance to the trade.

FANNY WEBB.—Plants of this new and attractive variety, 7*s.* 6*d.* each.

FIRST-CLASS DAHLIAS.

MITCHELL'S DUCHESS OF SUTHERLAND AND SULPHUREA ELEGANS.

JAMES MITCHELL will send out, early in May, his two unrivalled Seedling Dahlias—DUCHESS OF SUTHERLAND, white, mottled, and edged with crimson, the most beautiful and constant Show Flower ever offered; 24 blooms exhibited at the Surrey Gardens in September, 1853, and much admired; also First-class Prize at Maidstone, by Messrs. Neville and others; 4 feet, 10*s.* 6*d.* SULPHUREA ELEGANS, primrose-yellow, exquisite form, first-rate, and constant show flower, 4 feet, 10*s.* 6*d.*

MITCHELL'S NEW BLUE VERBENA ELEGANTISSIMA, an improvement on Mons. Paguin; the above magnificent Verbena at 2*s.* 6*d.* each. No discount, unless six are ordered.—Piltdown Nurseries, Maresfield, Sussex.

BEDDING OUT PLANTS FOR THE FLOWER GARDEN.

BURGESS AND KENT, Penkhull Nursery, Stoke-upon-Trent, Staffordshire, respectfully invite the attention of the Nobility, Gentry, and others about to furnish their Flower Gardens, to their extra large stock of fine established Plants of the under-mentioned varieties, which will vary in price according to the quality and quantity ordered. All communications will receive immediate attention.

TRENTHAM ROSY SCARLET GERANIUM, a beautiful variety, of compact habit and large trusser.

GOLDEN CHAIN GERANIUM, with fine gold band round the leaf; Tom Thumb, Trentham Scarlet, Victoria, and other Scarlets; Silver-striped and variegated Geraniums, in varieties; Yellow and Bronze Calceolarias, Salvias, Pentstemons, Cupheas, Petunias, Lobelias, Mimuluses, Antirrhinums, Heliotropes, Fuchsias, Double Purple Senecio, and Verbenas in great variety.

SUTTON'S GRASS SEEDS FOR PRESENT SOWING.—*The importance of procuring good Seeds will be proved more this season than usual, in consequence of the extreme drought which has prevailed so long.*

We are receiving very gratifying intelligence of the crops growing from the seeds we have supplied during the last few months. One of our customers (Mr. Joseph Newton) writing us from Biggleswade, on the 15th inst., says:—"*The Grass seeds I had from you have convinced our farmers that it is better to have your selected ripe seeds than to use the unripe hay seeds, from the cow-cribs and hay-lofts.*" Having a fine stock, we can still supply seeds, which may be sown now with certainty of success, viz., Permanent Pasture Grass Seeds; Seeds for Improving old Pastures; Turnip, Mangold, and other Agricultural Seeds. Priced Lists may be had, post free.

SUTTON & SONS, Seed Growers, Reading, Berks.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening Pursuits, are invited to examine DEANE, DRAY, AND CO.'s extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also wholesale and retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY AND CO. (Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

MORNING FROSTS.

"FRIGI-DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

CURE FOR MILDEW ON GRAPES, &c.—In consequence of the increased prevalence of mildew on the Vines, &c., during the last few seasons, G. TABER, of Rose Cottage, Rivenhall, practical Gardener, Seedsman, and Florist, has directed particular attention to the best mode of preventing it, or for curing the Vines that have been attacked, and he now begs to announce that he has succeeded in preparing a composition known as TABER'S ANTI-MILDEW COMPOSITION, which will effectually prevent or cure the disease without doing the slightest injury to the Vines; and any person, by the aid of the printed instructions, may use it without risk. It is also an invaluable remedy for preventing Mildew on Wall Trees, Roses, &c. Sold in packets containing 1 lb., 1*s.* 3*d.*; 3 lbs., 3*s.*; 6 lbs. 5*s.* 6*d.*, with directions for use. By enclosing two postage stamps, G. T. will send a circular with full particulars as to quantity required for a house for the season, and also testimonials of the success he has met with.

G. T. will personally attend gentlemen, and give instructions to their gardeners at a reasonable remuneration for time and travelling expenses. The trade supplied at the usual discount. Post Office orders to be made payable to GEORGE TABER, and Post Office drawn upon the Witham Post Office. Postage stamps received in payment of small orders. Packets delivered free to the Witham Station of the Eastern Counties line.—Address GEORGE TABER, Rose Cottage, Rivenhall, near Witham.

THE CHOLERA

PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts, 2*s.*; Pints, 1*s.*; Half-pints, 6*d.* Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates.

All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

TEA URNS, OF LONDON MAKE ONLY.—The largest assortment of London-made TEA URNS in the world (including all the recent novelties, many of which are registered) is on Sale at WILLIAM S. BURTON'S, from 30*s.* to 6*l.*

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 17*s.*; Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21*s.*; and Cots from 21*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 19*s.* to 13*l.* 13*s.*

PAPIER MACHE AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

Gothic shape Papier Maché Trays, per set of three	from 20*s.*	to 10 guineas.
Ditto, Iron ditto.	from 13*s.*	to 4 guineas.
Convex shape, ditto.	from 7*s.* 6*d.*	

A large quantity of small Papier Maché and Iron Trays, many of them executed in the highest style of art, at about a quarter of their original cost; being odd, or slightly out of condition. These are especially worthy the attention of tavern and coffee-house keepers. Round and Gothic Waiters, Cake and Bread Baskets equally low.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads, and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2*s.*, and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to your Nioukrene." H. ROUE, Esq.—"It has checked the greyness." MRS. JONES.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.—N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

ECONOMY.

ECONOMY should be practised in all things, but more particularly in matters of medicine. The restoration to health has generally been purchased at a costly price; and certainly if health could not be procured at any other rate, a costly price should not be an object of scruple. But where is the wisdom, where is the economy in spending vast sums on a physician's attendance, when sound health and long life may be ensured by that cheap, safe, and simple remedy Parr's Life Pills? Sold by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, Farringdon Street; Sutton & Co., Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in town and country. In Boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*, and in Family Packets, 11*s.* each

HOLLOWAY'S PILLS, AN ADMIRABLE REMEDY FOR INDIGESTION, FLATULENCY, AND BILIOUS COMPLAINTS.—The well-known properties of these excellent Pills are too highly appreciated in the present day to require any commendation; the test of years has proved their efficacy in curing Bile, Indigestion, Flatulency, Sick Headache, Nervousness, and debilitated Constitutions. They invigorate the body, strengthen the faculties of the mind, and increase the appetite. Old and young, rich and poor, resort to them when afflicted with any ailment, and none are disappointed in their effect upon the system. They may also be taken with perfect safety by persons of all ages, in every climate and at any season.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

DEAFNESS, SINGING NOISES IN EARS.—SELF CURE.—Extraordinary discovery.—Just published, sent post free on receipt of 16 postage stamps, A STOP TO EMPIRICISM AND EXORBITANT FEES. Every deaf person can restore his own hearing, without absence from home or personal consultations. This book will cure thousands, and rescue them from the grasp of the extortionate empiric. By Dr. HOGHTON, M.R.C.S., London, 2d May, 1845; L.A.C., April 30th, 1846. Consultations every day, Free, from 12 till 4.—9, Suffolk Place, Pall Mall, London.

PRIZE MANGOLD WURZEL AND SWEDE SEED.

SUTTON AND SONS have a fine stock of Seeds of the best kinds of Swedes, Mangold Wurzel, Carrot, &c., similar to those they supplied last season, the produce of which gained prizes at all the principal root shows throughout the kingdom.

At the Annual Root Show, held at Basingstoke, Hants, on December 21, 1853, *at which* 16 *prizes were awarded for root crops,* 13 *were gained with the produce of our seeds; and at the Reading Show, on the* 1*st of the same month, every prize was awarded to roots grown from our seeds.*

A Priced List, with Hints on Cultivation, may be had, post free, in return for one penny stamp.

SUTTON & SONS, Seed Growers, Reading, Berks.

LAWN AND PASTURE GRASS, &c.—The Subscribers will be happy to forward prices of the above to the Trade and others. DAWE, COTTRELL, and BENHAM (successors to FREDERICK WARNER), Wholesale Seedsmen, 3, Lawrence Pountney Lane, and 36, Moorgate Street, London. Agents for Butcher's Black Barbarossa Grape Vine, &c.

MAY'S PARAGON CABBAGE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ¼ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

TURNIP SEEDS! TURNIP SEEDS!

CARRIAGE FREE.

B. PAGE AND CO.'S Genuine Stock, saved from the finest transplanted Bulbs, will, as heretofore, gain the greatest number of Prizes at Root Exhibitions.

Offices, Oxford Street (ten yards from the Railway Terminus), and Above Bar, Southampton.

INGRAM'S PRINCE OF WALES STRAWBERRY.—This splendid new Strawberry, now so extensively grown at the Royal Gardens, Frogmore, both for forcing and out-door culture, may now be had of J. AND E. SMALL, at the following reduced prices:—Strong well-rooted Plants, 25*s.* per 100, or 15*s.* for 50. This is quite a distinct Strawberry to the Prince of Wales now being sent out by Mr. Cuthill, of Camberwell. Order Ingram's Prince of Wales.

The following new kinds can also be supplied at moderate prices:—Trollope's Victoria, Myatt's Superfine, do. Prolific, Nicholson's Ajax, do. Ruby, and Jackson's Britannia. The usual discount to the trade.—Agents, Messrs. NUTTING & SONS, Seedsmen, 46, Cheapside, London.

DILLISTONE AND CO. beg to offer the following:—STRAWBERRY PLANTS.—Ten of the best kinds always on hand, 2*s.* 6*d.* to 3*s.* 6*d.* per 100.

HOLLYHOCKS saved from 20 of the best named kinds, and kept separate, 3*s.* per dozen; 20*s.* per 100.

BEDDING PLANTS.—Many thousands will be ready in May, 3*s.* to 6*s.* per dozen, or cheaper if 100 are taken.

ROSES.—Tea, Bourbon, and Hybrid Perpetuals, and new ones, on the Manetti stock.

HERBACEOUS PLANTS, fine and good, 20*s.* to 30*s.* per 100.

Orders above 20*s.* paid to London. Lists upon application, enclosing a stamp.—Nurseries, Sturmer, Halstead, Essex.

WILLIAM CUTBUSH DECEASED.

WILLIAM AND JAMES CUTBUSH having administered to the effects of their father, the late William Cutbush, Nurseryman, of Highgate, request that all persons having any claims upon the same may forward their statements, which, if found correct, will be forthwith discharged. And all persons indebted to the Estate to Christmas last, are solicited to pay the same immediately to JAMES CUTBUSH, Highgate Nurseries, London.

NOTICE.

THE ADMINISTRATORS of the late JOSEPH FAIRBAIRN, of Clapham, Nurseryman and Seedsman, beg most respectfully to call the attention of Noblemen, Gentlemen, Amateurs, and the Trade, to their varied and extensive Stock of STOVE and GREENHOUSE PLANTS, particularly to their Ericas, Azaleas, and Aphelexis, which are all now in high perfection; also their Shrubs and soft-wooded Plants for Parterre and Border Planting in every variety. They beg to return their grateful thanks for the patronage so long bestowed on the old established Firm of JAMES & JOSEPH FAIRBAIRN, and afterwards on JOSEPH FAIRBAIRN alone; and to state that all Orders will receive their prompt and best attention, and they are prepared to do Business on such liberal terms, for Cash, as they trust will insure a continuance of such patronage.

Clapham Nurseries, near London, April 29.

CALCEOLARIA AJAX.

LUCOMBE, PINCE, AND Co., will send out, on the 24th May next, the above splendid new Shrubby Bedding Calceolaria. Its fine, strong, healthy, robust, yet dwarf compact habit, combined with a profusion of large brilliant flowers, render it suitable either for the Parterre or Conservatory. The original Seedling Plant was exhibited by L., P., & Co., at the Horticultural Society's Rooms, Regent Street, in May, 1853, and again April 18th, 1854, when the Certificate of Merit was awarded to it. The following extracts from the *Gardeners' Chronicle* render further description unnecessary.

Extract from the report of the Horticultural Society's meeting, May 24th, 1853, page 342:—"Lucombe, Pince, & Co., exhibited a Calceolaria called Ajax (yellow with brown blotch), which, having a stiff good habit, and multitudes of showy blossoms, will doubtless make a good bedding plant."

Report of meeting, April 18th, 1854, in the *Gardeners' Chronicle*, page 255:—"Messrs. Lucombe and Pince received a Certificate of Merit for Calceolaria Ajax, a dwarf, shrubby, bedding kind, remarkable for its great trusses of brown and yellow blossoms, which require no sticks to support them, owing to its sturdy habit. It was stated to be from Sultan, crossed with some high-coloured shrubby variety."

Good small plants, 42*s.* per doz.; extra strong plants, 7*s.* 6*d.* each.

Exeter Nursery, Exeter, April 29.

GERANIUMS, CALCEOLARIAS, MIMULUS, CHRYSANTHEMUMS, ETC.

THE FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

JOHN WESTWOOD, having now the largest and best selected stock of the above in the kingdom, including almost every variety known, is enabled to offer them for sale at prices unequalled.

None but healthy well-established Plants will be sent out, and all orders will meet with prompt attention, and so as to insure future support and recommendation.

J. W. has also for sale an immense quantity of Bedding and Soft-wooded Plants generally.

Catalogues sent (post free) to all parts.

N.B.—The Trade will be treated liberally and fairly.

TO NURSERYMEN, SEEDSMEN, AND FLORISTS.

TO BE LET, for a term of years, on lease, a BUSINESS in the above line now in full trade, and which has been conducted by the late proprietor's family for the last 60 years, and has always been a first-rate concern, as may be proved by the books and the trade generally. The Green and Forcing Houses are numerous and well appointed for all the purposes of business, the stock is all healthy, and can be taken by valuation, or an offer for the good-will and stock may be made, and the parties dealt liberally with.

For Particulars, and to treat, apply at Messrs. NUTTING & SONS, Seed Merchants, Cheapside, or DUNCAN HAIRS, Seed Merchants, St. Martin's Lane; or to A. P. HEWITT, Esq., Nicholas Lane, Solicitor to the Administrators.

TO BE LET, for a term of years, a sound Stock and well-known compact Corn Farm, with water, and other Meadow Land, altogether about 514 acres, in a most eligible and healthy district in Hants. Good Markets around, and a Railway Station on a Metropolitan main-line within half a mile. Also adjoining and together with the above, or to be let separately, an Arable Farm, of about 200 acres, in a ring fence. Entry for preparations may be had forthwith on both farms.—For a view and to treat, apply to LAMB, BROOKS & Co., Solicitors, Basingstoke and Odiham, Hants.

TO MARKET GARDENERS.

TO BE SOLD, with immediate possession, the LEASE for an unexpired term of 10 years from Michaelmas next, of 7 acres of beautifully STOCKED MARKET GARDEN GROUND, in the parish of Isleworth, peculiarly situated for Irrigation, with a COTTAGE upon the land. The upper crop is all of the choicest kinds, and the principal part just in its prime. The under crop consists of Raspberries and Black Currants, with about 2 acres of Violets.—Apply to MOSES ADAMS & SON, Auctioneers and Surveyors, Isleworth.

TO PIG AND CHICKEN FEEDERS.—Good Greaves may be had at 10*l.* per ton, upon application to TAYLOR & PEARS, 8, George Yard, Lombard Street, City.

WANTED, PURE WHITE SPANISH FOWLS.—Any persons having Eggs of the above Fowls to dispose of, are requested to communicate particulars of price, &c., to THOMAS AUNESS, Easton Lodge, near Norwich.

COCHIN CHINA POULTRY, ETC.

EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

BRAHMA POOTRA EGGS, from the choicest Birds of an Amateur, Brahmas of whose breeding have competed successfully at the first Shows in the Kingdom, viz., the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Norwich, Winchester, and Manchester. Price three guineas per dozen, warranted from the best prize and selected birds only.—W. C. G., Post Office, Sandbach, Cheshire.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

TO POULTRY FANCIERS.

DUCK-WING GAME FOWLS' EGGS, from first-rate Prize Birds. Also White Bantams.—For particulars, price, &c., apply to JOHN MORRIS, jun., Ampthill, Beds.

EGGS FOR HATCHING, all from Prize Birds.—Silver Spangled Polands, 20*s.* per dozen; White Crested Black Poland, 15*s.* ditto; Golden Spangled Hamburgh, 10*s.* ditto; White Aylesbury Ducks, 5*s.* ditto, box included. Some Golden Spangled Hamburgh Fowls for Sale.

Post-office Orders payable to THOMAS P. EDWARDS, Lyndhurst, Hants.

EGGS from CAPT. HORNBY'S celebrated Spanish and Dorking Prize Fowls may be had on application to Mr. H. D. DAVIES, Spring Grove, Hounslow, to whom Capt. Hornby has transferred his whole stock. Spanish, 4*l.* 4*s.* per doz.; Dorking, 3*l.* 3*s.* per doz. Remittances to be made by post-office order, and to include 2*s.* for packing.

SPANISH AND DORKING FOWLS.—Captain HORNBY having transferred his whole Stock of celebrated POULTRY to Mr. H. D. DAVIES, of Spring Grove, Hounslow, a portion (for want of space) is for immediate sale.

TO BE SOLD, a very fine COCHIN CHINA COCK AND TWO PULLETS, chickens of 1853, price 2*l.* 2*s.* The Cock is not from the same strain as the Pullets, which were purchased from Sturgeon. Also three fine Aylesbury Ducks and Drake, price 1*l.* 5*s.* The fowls and ducks are all from prize strains, and are now laying.—Rev. R. M. T., Post Office, Atherstone, Warwickshire.

Sales by Auction.

MILCOTE, NEAR STRATFORD-ON-AVON.

IMPORTANT SALE OF SHORT-HORNED CATTLE.

MR. STRAFFORD has received instructions from Mr. J. C. Adkins to Sell by Auction, without any reserve, at Milcote, near Stratford-on-Avon, Warwickshire, on WEDNESDAY, the 3d of May next, his Herd of SHORT-HORNED CATTLE, consisting of about 50 head of Bulls, Cows, and Heifers, which possess remarkably pure and fashionable blood, being descended from the famed herds of the Earl of Carlisle, Earl Spencer, Sir C. Knightley, Messrs. Arbuthnot, Charge, Jaques, Stephenson, and other renowned breeders. They are in a healthy and prolific state, not having been made up for Sale. After which will also be Sold, without any reserve, 20 Head of choice SHORT-HORNS, the property of Mr. C. W. Goode, of Mickleton, that have been chiefly purchased and bred from the Stock of Mr. Adkins.—Catalogues with the pedigrees may be had of Mr. STRAFFORD, 13, Euston Square, London; or of Mr. Adkins, at Milcote, near Stratford-on-Avon, Warwickshire.

BRAMAH POOTRA, DORKING, SPANISH, COCHIN CHINA, AND OTHER CHOICE FANCY POULTRY.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, May 2, at 12 o'clock precisely, 50 BRAMAH POOTRA FOWLS, of the choicest quality, imported by Mr. Baily; first-class Dorkings, white and buff Cochins, from Dr. Allen and others; some well bred Spanish, Aylesbury Ducks, &c.—Catalogues by inclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

ORCHIDS FROM GUATEMALA.

MR. J. C. STEVENS begs to notify that he will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 5th May, an IMPORTATION OF ORCHIDS, just received from Mr. Skinner, who is now in Guatemala, and under whose directions they have been collected; they comprise all the splendid varieties from that country, in magnificent masses, and in the best possible condition.—Catalogues are preparing and will be forwarded in due course.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, May 4th, at 12 o'clock, a first-rate collection of CARNATIONS, PICOTEES, and PINKS, a fine assortment of Fuchsias, Verbenas, and Dahlias, in dry roots; American Plants, Geraniums, and other Plants in Bloom, with a variety of Hardy Perennial and Rock Plants.—On view the morning of Sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BLACKHEATH.

To NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, & OTHERS.

MESSRS. PROTHEROE AND MORRIS beg to intimate that they have received instructions from Mr. W. P. Ayres, Nurseryman (removing to a distant part of the country), to submit to public competition by Auction, in the Lecture Hall, adjoining the Blackheath Station of the North Kent Railway, on TUESDAY, 9th, and WEDNESDAY, 10th of May, at 11 o'clock, the whole of his unrivalled collection of Specimen FANCY PELARGONIUMS, fit for exhibition; also Stove and Greenhouse Plants, Bedding Plants, &c.; together with many thousands of the choicest Pelargoniums just coming into bloom, Fuchsias, Chrysanthemums, Roses, &c.—Catalogues are in preparation, and may be obtained (6*d.* each, returnable to purchasers) of the principal Seedsmen in London; of Mr. AYRES, and at the Lecture Hall, Blackheath; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, on the premises, Rush Grove, Woolwich, on MONDAY, May 1st, at 12 o'clock, by order of Mr. J. Grisbrook, leaving the premises, the whole of the Greenhouse Plants, consisting of fine specimen Azalea indica, Erica, Epacris, Aphelexis, Pimelea, Chorozema, Correæa, Diosma, Acacia, Geraniums, Camellias, Cactus, Cinerarias; also Lilium lancifolium, rubrum, punctatum, and album; a quantity of Plants for bedding; 5 capital 1, 2, and 3-Light Boxes, 2 Thermometers, Rustic Seats, Tables, Flower Stands, and sundry effects.—May be viewed two days prior to the sale; Catalogues may be had (6*d.* each, returnable to purchasers), on the premises; of the principal seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO TULIP FANCIERS, GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction on the premises, Culley's Nursery, near the New Globe Tavern, Bow Road, Middlesex, on MONDAY, May 22d, at 2 o'clock, a Superb Collection of TULIPS, including about 400 varieties, and most of the choicest in cultivation, the property of Mr. Staines, comprising in the Bizarres Compton's, Lord Lilford, Pilot, Duke of Devonshire, Competitor, Marcelles ex., Don Cossack ex., Dangerous, Jacomb's Perfection, ex. ex., Coronation, Fabius, &c.; among the Roses are Anastasia, Lady Stanley, Miss Catherine, Mary Lamb, Flora M'Donald, Zuill's Flora, Duchess of Sutherland, Rose Lac, Aglaia, Rose Magnificent (Betterell's), Brutante Ecletante (Aker's), Ponceau Brilliant; Franklin's Ariadne, Queen, Lord Brougham, Harriot, Lalla Rookh, the Byblœmens comprise Princess Royal, Maid of Orleans, Chellaston Beauty, Sable Monarch, Van Amburgh, Thalia, Louis XVI., Violet Quarto ex., Pandora, Lydes' Nora Creina, Wallace, Addison, Waterwitch ex. ex., &c.; together with the following Mile-end Seedlings, not yet known in many other collections, viz., Isabella ex. ex., Lord Lonsdale, Morning Star, Jupiter ex. ex., Leo Leoni ex. ex., Bizarre ex., and Sarah.—Catalogues ready one week prior to the sale, and may be had of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND EXHIBITORS.

ST. MARGARET'S, ISLEWORTH.—THE EARL OF KILMOREY'S MATCHLESS COLLECTION OF ORCHIDACEOUS, STOVE, AND GREENHOUSE PLANTS.

MR. CAIN is instructed to Sell by Auction, on the premises as above (in consequence of the Earl of Kilmorey having disposed of his interest in the premises), on TUESDAY, May 2d, and following days, at 12 for 1, this NOBLE COLLECTION OF PLANTS, consisting of specimens of unrivalled excellency, and comprising all the choice varieties of Orchids, viz., Aerides, Anæctochilus, Bletia, Brassia, Cattleya, Cœlogyne, Cypripedium, Dendrobium, Epidendrum, Miltonia, Oncidium, Peristeria, Phaius, Sobralia, Stanhopea, Vanda, and Zygopetalum. The Ericas comprise fine Exhibition specimens of Cavendishi (very fine), depressa, elegans, Hartnelli, jasminiflora alba, Massoni major, metuleflora bicolor, perspicua nana, tricolor, vestita, &c. &c. About 100 of the choicest varieties of Camellias, of fine handsome growth, with good show of bloom. Two fine specimens of Araucaria excelsa, or Norfolk Island Pine; one 12 ft. high, beautifully furnished, and one 6 feet 6 inches, a fine tree. The collection of Azaleas comprise some of the finest specimens of the most choice varieties. Rhododendrons consist of a splendid collection of rare species, Orange trees of fine and noble growth. The Stove Plants comprise fine specimens of Allamandas, Begonias, Dipladenias, Franciscea, Gardenia, Ixora, Stephanotis, &c. Large American and plated Aloes of the most choice species. The plants are in a healthy state, and present a fine show of bloom;—to noblemen and nurserymen an opportunity of possessing fine exhibition plants for the forthcoming shows. Sculptured Stone and other Pedestals, and Ornamental Vases; a fashionable Chariot, in excellent order; a perfectly new four-oared Racing Boat, by Salter; a Wager Boat, by Clasper; Garden Tools and Implements; a long, three-tier shaped, iron Flower Stage, and other effects.—May be viewed, by Catalogues, at 1*s.* each (returnable to purchasers), one week prior to the sale; to be had on the premises, and of the Auctioneer, King Street, Richmond, Surrey.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, APRIL 29, 1854.

Office for Advertisements and Communications, 5, Upper Wellington Street, Covent Garden, London.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given, that the FIRST EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on SATURDAY, May 13, at 2 P.M.

Tickets, price 5*s.* each, can be procured at this Office, upon presenting the order of a Fellow, or on the day of the meeting, at Turnham Green, price 7*s.* 6*d.* each.—21, Regent Street, London.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The days appointed for the EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season are WEDNESDAYS, May 24, June 21, and July 5; and of AMERICAN PLANTS, MONDAYS, June 12 and 19.

Tickets of Admission can be obtained at the Gardens by orders from Fellows of the Society. Price on or before May 13, 4*s.*; after that day, 5*s.*; or on the days of Exhibition, 7*s.* 6*d.* each.

The Plants will be arranged on a new plan, similar in form to the American Garden, and placed upon a series of terraces.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The Second Exhibition for this season will be held at the HORNS TAVERN, Kennington, on TUESDAY, the 23d of May (instead of the 25th, as before advertised), when prizes will be awarded for the following productions, viz.:—Miscellaneous Plants, Pelargoniums and Fancy Varieties, Tulips, Heartsease, &c. In addition to the prizes offered by the Society, Mr. R. T. Lawrence, of Hampton, offers 5*l.* value in Tulips in prizes to Amateurs. An efficient Band will be in attendance. Admission to non-members from 2 till 6 o'clock, at One Shilling each. List of Prizes may be obtained at the Horns Tavern, and from John Bushell, Esq., Secretary, *pro tem.*, Lower Kennington Lane, Lambeth, Surrey.

WEST KENT SECOND ANNUAL POULTRY AND FLOWER EXHIBITION, Under most distinguished Patronage, will take place on TUESDAY and WEDNESDAY, the 20th and 21st of June next, in the Market Field, Farningham.

Prizes will be awarded for Poultry, Pigeons, and Rabbits. Stove, Greenhouse, and Herbaceous Plants, Fruits, Vegetables, Roots, and Cut Flowers. Applications for Forms of Certificates of Entry, Prize Lists, and Regulations for Poultry, &c., to be made to the Secretary, and for Flowers, &c., to Mr Alfred Lockyer, Secretary, Farningham. By Order of the Committee of Management, Baptiste Thomas, Secretary.

Committee Room, Lion Inn, Farningham, Kent.

MARLBOROUGH HOUSE, PALL MALL.—Professor EDWARD FORBES, F.R.S., will deliver a Course of Eight Lectures on "The Forms and Colours of Animals and Plants" at the above place, on Friday Afternoons, at 4 o'clock, viz., May 12th, 19th, and 26th; June 2d, 9th, 16th, 23d, and 30th.

EXHIBITION OF TULIPS.

HENRY GROOM, Clapham Rise, near London, by Appointment Florist to Her Majesty the Queen, and to His Majesty the King of Saxony, respectfully announces that his EXTENSIVE COLLECTION OF TULIPS is now in flower, and may be viewed every day from 9 o'clock until 6 (Sundays excepted).—Admittance 1*s.*, Children half-price.

EXHIBITION OF TULIPS.

W. H. LAWRENCE, of the Red Lion, Hampton, begs to inform his friends and the public, that his unrivalled Collection of TULIPS is in bloom, and will continue to the end of the month.—Admittance Gratis.

EXHIBITION OF TULIPS, PELARGONIUMS, CINERARIAS, PANSIES, ETC.

C. TURNER'S extensive Collections of the above are now in fine bloom, and may be viewed, Sundays excepted, for the next three weeks.

Royal Nursery, Slough, May 6, 1854.

EXHIBITION OF SPECIMEN PLANTS.

J. AND J. FRASER beg to invite the attention of the Nobility and Gentry to an inspection of their fine collection of Specimen CHINESE AZALEAS and other plants, which are now in bloom. The plants are so arranged in various Greenhouses as to have a similar effect to that produced at the Metropolitan Flower Shows. The collection comprises those specimens which have been exhibited so often at the Regent's Park and Chiswick Gardens, at which places they have taken the leading prizes.

The Nursery is about 15 minutes' walk from the Lea Bridge Station on the Eastern Counties Railway. Trains leave London at 9 a.m., 9.30 a.m., 10 a.m., 10.40 a.m., 12.30 a.m., 1.40 p.m., 2.30 p.m., 3.20 p.m., and 4.45 p.m.—Admission Gratis.

Lea Bridge Road, Essex, May 6, 1854.

HOLLYHOCK "LIZZY."

A. PAUL AND SON have still on sale a few strong plants of this superb new Hollyhock (colour clear peach) which obtained ten first prizes last year, price 10*s.* 6*d.* each.—Nurseries, Cheshunt, Herts, 6th May, 1854.

BEDDING PLANTS.

JOHN HAYES, Florist, Farnham, Surrey, begs to say he is prepared to send out the above from 1*s.* to 4*s.* per dozen; the season being favourable, the plants are remarkably good. 50 Seeds of a good useful CUCUMBER sent for 12 stamps. Descriptive Catalogues sent for one postage stamp.

BEDFORD NURSERY, ACRE LANE, BRIXTON.

W. J. SANGSTER begs to say he is prepared to send out his admired New Seedling GERANIUM the "BEAUTY OF CLAPHAM," an excellent variety for pots and bedding culture, noticed in *Gardeners' Chronicle* as a beautiful rosy pink, and a very pretty variety. Good strong plants, 7*s.* 6*d.* each. Also a great variety of Bedding plants at 4*s.* per dozen, and every kind of Nursery Stock at very moderate prices.

TO THE SEED TRADE AND OTHERS.

BENJAMIN R. CANT, St. John's Street Nursery, Colchester, can supply in quantity the following Home-grown Seeds, of excellent quality:—

	Per lb.—*s.*	*d.*
WHITE BELGIAN CARROT	1	0
LONG RED ALTRINGHAM Do.	1	0
YELLOW GLOBE MANGOLD WURZEL	1	0
LONG RED Do.	1	0

Prices to the Trade on application.

JOHN HOLLAND offers superb named SHOW PANSIES, at 4*s.* per dozen Plants. Extra fine selected PANSY SEED, 1*s* and 2*s.* per packet.

Bradshaw Gardens, Middleton, near Manchester.

SAMUEL WALTERS begs to offer the following:—New and Choice GERANIUMS, New PETUNIAS, FANCY GERANIUMS, FUCHSIAS, VERBENAS, BEDDING PLANTS, &c. Orders of 1*l.* and upwards will be forwarded any distance not exceeding 100 miles, carriage free. See *Gardeners' Chronicle*, p. 250.—Hilperton and Trowbridge, Wilts.

WILLIAM BARNES begs to inform his friends and the public generally, that his SPRING CATALOGUE is now ready, and can be had on application; it contains all the leading and most approved varieties in cultivation, of Indian Azaleas, Cinerarias, Calceolarias, Verbenas, Fuchsias, Hollyhocks, Phloxes, Roses, Geraniums, Chrysanthemums, Perpetual blooming Carnations, Petunias, Delphiniums, and Liliums, with many other plants too numerous to insert here. W. B. has much pleasure in stating his stock is exceedingly healthy and clean, and warranted true to name.—Camden Nursery, Camberwell.

TURNIP SEEDS.

J. R. AND A. PEARSON, believing RED ROUND to be the best common Turnip for early sowing, and GREEN BARREL for late, are sending them out at 1*s.* per lb., including package, and warrant every seed to grow. As our firm have supplied the late Duke of Portland for between 40 and 50 years, and many of the largest farmers of Nottinghamshire and Lincolnshire, we think it unnecessary to add testimonials as to the character of our Seed, which is all grown by ourselves, on our own farm.—Chilwell, near Nottingham.

TO BE SOLD, 400 TULIPS, and 350 AURICULAS. Tulips, 2*s.* per dozen; Auriculas from 6*s.* per dozen.—Apply to Mr. Henry Crane, Southgate, Middlesex.

TO BE SOLD, at a moderate price, a fine specimen of FAN PALM, or CORYPHA UMBRACULIFERA, 9 feet high and 12 feet in circumference, some of its leaves 6 feet across.—For further particulars address to Thomas Cooling, Mickleover, near Derby.

SOFT-WOODED PLANTS, in large variety; suitable for decorating the Flower Garden during Summer and Autumn. To be had at low prices from the subscribers,

HUGH LOW & Co., Clapton Nursery, London.

NEW ALSIKE CLOVER, Price Ten Guineas per cwt., or in small quantities at 2*s.* per lb., may be had on application to Mr. H. Raynbird, Basingstoke, Hants. Also New Home-grown ITALIAN RYE-GRASS, of good and genuine Stock, at 30*s.* to 35*s.* per quarter.

FINE MANGOLD WURZEL SEED.

LONG RED MANGOLD WURZEL. Fine new Seed, 10*d.* per lb., or 70*s.* per cwt.

JOHN SUTTON AND SONS, Seed Growers, Reading, having a large Stock of the above, are now selling it at the low price here quoted. LARGE YELLOW GLOBE and other sorts, as see Priced List, which may be had in return for one postage stamp.

LARGE YELLOW GLOBE MANGOLD WURZEL, and all other kinds at low prices in large quantities. For particulars address (stating quantities required) JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

GARDEN SEEDS FOR PRESENT SOWING.—Good Seeds of all the best kinds of Lettuces, Broccolies, Cauliflowers, Peas, and other Vegetables, may still be obtained of the undersigned. Priced Lists post free.—Address,

JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

NEW TURNIP SEEDS DIRECT FROM THE GROWERS.

WILLIAM E. RENDLE AND CO. have this season a very superior stock of all kinds of TURNIPS, and they recommend all who are in want of the best varieties to procure their "Farming Price Current and Agricultural Directory," to be had in exchange for six penny stamps.—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

DAHLIAS, GERANIUMS, FUCHSIAS, AZALEAS, BEDDING PLANTS, &c., can be had from WILLIAM E. RENDLE AND CO., Nurserymen, Plymouth, in any quantity. Their New Plant Catalogue is now out, and can be had in exchange for one penny stamp.—Apply to

WILLIAM E. RENDLE AND CO., Nurserymen, Plymouth.

FINE GRASS SEEDS FOR ORNAMENTAL PARKS, LAWNS, &c., *where a fine sward is required, 1s. 3d. per lb., 3s. per gallon, and 20s. per bushel. Our mixtures for this purpose have given the greatest satisfaction.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

LOBELIA ST. CLARE.

MESSRS. LAKE AND DYER, Nurserymen, &c., Bridgewater, are prepared to send out this truly beautiful plant (so universally admired last autumn), at 12*s.* per dozen.

Postage stamps or Post-office Order must accompany all orders from unknown correspondents.—N.B. The Trade supplied.

NEW DAHLIA—MAGNET.

CHARLES KIMBERLEY is now sending out the above beautiful Dahlia; colour, ruby crimson, very constant, of first-rate form, one of the best flowers of the season; was awarded a Certificate at Brighton Open Show, September 14th, and National Society, London, September 22d. Strong Plants, 10*s.* 6*d.* each; usual allowance to the Trade. Catalogues of Dahlias and Miscellaneous Choice Plants may be had on application.—Stoke Nursery, near Coventry.

THOMAS HANDASYDE, Glen Nurseries, Musselburgh, by Edinburgh, is now prepared to send out Plants of his new Pansies; MARY BLANCHE, at 5*s.*; and GLEN BEAUTY, at 3*s.* 6*d.* each. These will prove equally good with his Duke of Perth, so well known. Also fine established Plants of all the leading sorts of DAHLIAS and other Florists' Flowers, priced Catalogues of which may be had on application.

BEDDING PLANTS.

J. WOOD AND SONS, Nurserymen, &c., Old Kent Road, and Bowyer Place, Camberwell, begs to inform their friends that they have a large quantity of bedding plants established in pots, at 3*s.* per dozen, comprising Pelargoniums, Scarlet Geraniums, Verbenas, Petunias, Ageratums, Salvias, Cupheas, double Senecios, Heliotropiums, Fuchsias, Lobelias, Calceolarias, Mimulus, Anagallis, &c. &c. Dahlias, good flowering sorts, 4*s.* to 6*s.* per dozen. Strong Rollisson's Unique Geraniums 9*s.* per dozen.—Post-office orders made payable at Old Kent Road.

BEDDING PLANTS.—Many thousands of the above desirable Ornaments for the Flower Garden are now ready to be sent out, by John Scott, of the Merriott Nurseries, near Crewkerne, Somerset, at the very low price of 2*s.* 6*d.* per dozen, consisting of

100 Sorts of VERBENAS		100 Sorts of FUCHSIAS	
50 " GERANIUMS		12 " CALCEOLARIAS	
12 " PETUNIAS		12 " LOBELIAS	

With many other kinds too numerous to particularise. Nearly all are autumn-struck plants. Early application is solicited.

N.B.—All other kinds of Nursery Stock extensively grown.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to call attention to their MIXTURES OF GRASS SEEDS for laying Land down to Permanent Grass, price 30*s.* per acre.

Mixed sorts, for Improving Old Grass Land... 1*s.* 2*d.* per lb.
Fine sorts for Forming and Renovating Lawns 1 3 "

Directions for sowing accompany the seeds.

George Gibbs & Co. will be happy to forward their Priced Catalogues of Mangold Wurzel, Carrot, Swede, Turnip, and all Agricultural Seeds, free on application to George Gibbs & Co., Seedsmen, 26, Down Street, Piccadilly, London.

EUGENIA OR MYRTUS UGNI.

MESSRS. VEITCH AND SON, of Exeter, and the Exotic Nursery, Chelsea, have much pleasure in offering to the Public the above beautiful evergreen flowering shrub, of their own introduction, from Patagonia, through their collector, Mr. Wm. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by its Strawberry-flavoured red berries, eaten in Chili as dessert. It is a plant of easy culture, flowering in a very small state, when not above 6 inches high, and is well adapted for pot culture. It is figured by Sir Wm. Hooker in Curtis's "Botanical Magazine" for January, 1852.

Strong blooming plants, in 48-sized pots, 21*s.* each.
Second size do. in 60-sized pots, 15*s.* each.

With the usual discount to the Trade, and one over on either class when three are taken.—Exeter, May 6.

CHOICE BEDDING PLANTS.

YOUELL AND CO.

BEG TO OFFER THE FOLLOWING :—

CALCEOLARIAS.—The following four very handsome varieties will be found the gems of the season for bedding purposes:—

CRIMSON KING (Henderson), deep crimson, very dark and rich, and does not fade; habit dwarf and robust, flowers large, and shape good. 12s. per dozen.

MAGNIFICENT (Henderson), rich crimson, with yellow crown; a large, fine-formed, and very splendid flower, quite distinct from anything yet out. 12s. per dozen.

GOLD CHAIN, fine golden yellow, of great substance and fine habit, with very stout foot-stalks. 12s. per dozen.

GOLD CAP (Garraway), rich dark maroon, the upper division of the flower deep gold colour, the flowers large and of fine compact habit. 12s. per dozen.

Also the following older favourites for bedding :—

BEAUTY OF MONTREAL, fine bright crimson, dwarf habit, 6s. per dozen.

WELLINGTON HERO, rich deep golden yellow, 6s. per dozen.

SULTAN, large rich crimson, 6s. per dozen.

MRS. BEECHER STOWE, fine canary, 9s. per dozen.

SULPHUREA SPLENDENS, fine yellow, dwf. habit, 6s. per doz.

Calceolarias (Seedlings not yet flowered) raised from "Benary's" superb spotted varieties, 5s. per dozen, post free.

GERANIUM—Boule de Neige, a pure white-flowering horse-shoe leaved variety, of compact habit, producing large trusses of well formed flowers, 18s. per doz.

" Kingsbury Pet, a bright rosy salmon, with dark horse-shoe leaf and of the same habit as the foregoing, 18s. per dozen.

" Flower of the Day, 9s. per dozen.

" Mountain of Light, 18s. per dozen.

" Fancy varieties, of fine kinds, 12s. per dozen.

" Shrubland Pet, 9s. per dozen.

" Scarlets, in fine variety, 6s. per dozen.

" Sweet-scented species, 9s. per dozen.

Verbenas, of the choicest kinds, including all the most approved of the Continental varieties, 4s. and 6s. per dozen.

Petunias, of the best kinds, 4s. to 6s. per dozen.

Oxalis rosea, one of our prettiest rose-coloured hardy bedding plants, of dwarf habit, and nearly always in flower, 6s. per doz.

Œnothera riparia, a pretty trailing plant, of dwarf habit, quite hardy, producing a profusion of canary-coloured blossoms throughout the year. 6s. per dozen.

Heliotropes, in fine variety, 6s. per dozen.

Anagallis rubra grandiflora, fine for bedding, 4s. per dozen.

Cuphea platycentra, 4s. per dozen.

Lobelia racemoides and lucida, 4s. per dozen.

Antirrhinums, of the finest kinds, 6s. and 9s. per dozen.

Pentstemons, do. do., 6s. per dozen.

Gorteria pavonia, a fine hardy plant, of trailing habit, producing throughout the year a gorgeous display of orange-coloured flowers, spotted with black, 9s. per dozen.

Campanula corallina, an extremely pretty dwarf hardy bedding plant, of compact habit, bearing a profusion of light-blue bell-shaped flowers from May till November; 6s. per dozen.

Neirembergia filicaulis, 6s. per dozen.

PHLOXES.—The following fine varieties; 9s. per dozen:—Spenceri, Imbricata, Abdel Medschid Khan, Anais, Captivation, Elegantissima, Eliza, Hydrangæformis, Imperialis major, Roi Leopold, Macrantha, Madame Courcelles, Madame Poivre, Napoleon, Nelsoni, Princesse de Cleves, Speciosissima, Villaret Joyeuse, Princesse Marianne, Speculum, &c.

Potentillas, of the handsomest varieties, by name, 6s. per dozen.

Mimulus Colei and purpurea maculata, two fine hardy varieties, forming bushy plants, 1½ ft. in height, the former producing bright red flowers, with dark maroon centre; the latter purple flowers, with crimson centre; 6s. per dozen.

Daisies, new Belgian, in 50 fine varieties; 4s. per dozen.

Saponaria ocymoides, a pretty hardy trailing plant, adapted for rockwork; flowers of a light rose colour; 6s. per dozen.

Salvia oppositifolia, 4s. per dozen.

Silene maritima plena, fine double white, very compact habit, 9s. per dozen.

Dielytra spectabilis, 9s. per dozen.

Funkia grandiflora, 2s. 6d. each.

Rockets, double white, 3s. per dozen; purple, 4s. per dozen; crimson, 1s. 6d. each.

Calystegia pubescens (double rose-coloured Convolvulus), quite hardy, 9d. each, or 6s. per dozen.

Herbaceous Plants, in fine variety, 25s. per 100.

FUCHSIAS.—Possessing a fine stock of the following new varieties, we offer them at 12s. per dozen, viz.:—Duchess of Lancaster, England's Glory, Incomparable, King Charming, Perfection, Globosa perfecta, Glory (Banks), Model, Premier, Commodore, Bride, Ariel, and Hendersoni; fine kinds of the older favourites, 6s. per dozen.

CARNATIONS AND PICOTEES.—Beautiful selections from our extensive collection, at 18s., 24s., and 30s. per dozen pairs; fine mixed, for borders, 9s. per dozen pairs. True Old Clove Carnation, 12s. per dozen pairs.

PINKS.—Extra fine sorts by name, 9s. to 12s. per dozen pairs.

PANSIES.—The following choice kinds, at 10s. per dozen varieties:—Alba Superba, Androcles, Blanche, Cæsar, Calysto, Caroline, Commander-in-Chief, Crystal Palace, Drusilla, Duchess of Rutland, Elegant, Emma, Euphemia, Glory, Helen, Heroine, Indian Chief, Isabella, Junius, Lady Carrington, Lady Franklin, Lady Harding, Lord Jeffery, Marchioness of Lothian, Masterpiece, Miriam, Miss Talbot, Mrs. Beck, Penelope, Polyphema, Post Captain, Prince Arthur, Princess, Queen of England, Rubens, Sambo, Smolensko, The Rajah, Uttoxeter Hero, Viceroy, Yellow Prince.

CHRYSANTHEMUMS, comprising the very best of the new kinds of large flowering and Pompon varieties, in strong plants, 9s. per dozen.

☞ Less quantities than those named above supplied at the same prices. Orders of 2*l.* and upwards are delivered Carriage Free to London, Hull, Newcastle-on-Tyne, or to any Railway Station within 150 miles of the Nursery.

YOUELL & CO., Royal Nursery, Great Yarmouth.

CAPE HEATHS AND NEW AZALEAS.

W. J. EPPS begs to call attention to his extensive and rare Collections of Heaths and Azaleas, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c. AZALEAS—Prince Albert, Gledstanesi, Excelsa, Murrayana, Alba magna Duke of Devonshire, Holderi, Toilette de Flora, Glory of Sunning Hill, Symmetry, Splendens, Ignescens, &c., &c., 9s., 12s., 18s., and 21s. per dozen; 5*l.* per 100 varieties, carriage paid to London. All the new Stove and Greenhouse Plants, Fuchsias, Verbenas, and Roses, equally moderate. Catalogues of the above sent on application.—Nurseries, Maidstone and Ashford.

YELLOW SEEDLING DAHLIA, "MRS. H. N. FERGUSON."

DOWNIE AND LAIRD have much pleasure in intimating that they will send out the above-named Dahlia, raised by Mr. John Young, gardener, Archerfield. It has been successful wherever exhibited, viz.:—Letter of Commendation at Royal Caledonian Horticultural Society, in 1852 (one bloom); Ditto at ditto, in August, 1853 (two blooms); Certificate of Merit at ditto, September, 1853 (six blooms); one of 12 blooms, which gained the Silver Cup at ditto in September, 1853; one of 16 blooms, which gained the first prize at Haddington, September, 1853; one of 12 blooms, ditto at ditto, September, 1853. This flower was also submitted to Mr. Turner, Royal Nursery, Slough, for his opinion (see "Florist," September, 1853, under "J. Y."):—"A large and finely-formed yellow, very deep and full; if as good late as early, will be a great acquisition." Plants in May, 1854, 10s. 6*d.*, with the usual discount to the trade.

D. and L. have also to intimate their stock of Florists' Flowers is now very complete, embracing all the newest and finest in cultivation, a new List of which, for 1854, may be had on application.

17, South Frederick Street, Edinburgh.

HONEYSUCKLE VERBENA.—So named for its delightful perfume, which is so near the odour of the Honeysuckle that it cannot be distinguished from it. Last season it was the constant inquiry of visitors at the Nursery Grounds if Honeysuckles were growing near, or what flower so much resembled them in fragrance, and on being informed it was the above new variety of Verbena, they were much surprised, and immediately ordered plants of it. Description—viz., compact habit, fine glossy foliage (will do excellently for bedding, or as a plant for pot culture), long stems to flowers, making it very useful for bouquets—blooms most abundantly; colour rich dark crimson, shaded lilac, very distinct eye; the truss of a fine globular shape, generally measuring 9 inches in circumference, all the pips fully expanded. It will force well during the winter, being a great advantage for cutting, or for its perfume in a greenhouse or conservatory at that season of the year; it will also stand the sun and rain during summer better than any other Verbena. A few blooms added to a bouquet will give it the scent of the sweetest Honeysuckle. Fine strong plants are now ready for sending out, at 5s. each.

LOBELIA LINDLEYANA.—The subscriber having purchased the whole stock of the above new Lobelia of Mr. Keynes, Salisbury, he begs to offer it to the public. It was awarded a Certificate of Merit at the Horticultural Society and National Society of London, June 1853. Description—viz.: Habit, dwarf and compact, flowering very freely, covering the whole surface of the plant; distinct in colour from all others yet out, being a bright rosy lilac. It is an excellent bedding variety, and will be sure to please every one who grows it, especially for its distinct colour and profusion of bloom. Strong plants now ready at 3s. 6*d.* each.

The usual allowance to the Trade when three plants of either are ordered. On receipt of a post-office order or penny postage stamps to the amount, the plant or plants will be sent postage and package free.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.—May 6.

FLOWER SEEDS FOR PRESENT SOWING.

☞ An extensive assortment of Bedding Plants.

Goods Carriage free (not under 20s.) to all the London Termini and all Stations on the London and Norwich Colchester Line; and Plants added gratis with orders of 40s. and upwards.

Post-office Orders payable to BASS & BROWN, or to STEPHEN BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

BEAUTIFUL NEW BEDDING PLANT. MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12s. per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

WIVERY'S SPRING CATALOGUE can be had on application, post free; and he begs to offer a few good and select Plants for Bedding.

LOBELIA ERINUS and CÆRULEA ALBA, Seedlings of 1853; colour, bright sky-blue, with white throat, much larger flower than any of the Erinus tribe; strong grower, and very free bloomer, decidedly the best of the class, 2s. 6d. each, or 21s. per dozen, strong plants.

GERANIUM—Trentham Rosy Scarlet, a beautiful variety, compact habit, large trusser, quite distinct in colour; must become a great favourite for bedding, 2s. each, or 18s. per dozen.

GERANIUM—Golden Chain, fine healthy plants, 18s. per dozen; extra size, 2s. 6d. each.

GERANIUM—Flower of the Day, strong healthy plants, 9s. to 12s. per dozen.

CALCEOLARIAS—Beauty of Montreal, Brilliant, Crimson King, Magnificent, Model, Gold Cap; the above are splendid varieties for bedding, 18s. per dozen. Other good varieties from 6s. to 12s. per dozen.

Also a fine stock of VERBENAS, SCARLET GERANIUMS, PETUNIAS, and all other bedding plants, at moderate prices.

W. I. has a fine stock of the best Show, Fancy, and mixed GERANIUMS, FUCHSIAS, CINERARIAS, AZALEAS, Winter Flowering CARNATIONS, Pompone and large Flowering CHRYSANTHEMUMS, Herbaceous and other Miscellaneous Plants, too numerous to insert here.

Hanover Nursery, Peckham, near London, May 6.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21s.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21s.

MITCHELL AND CO., having a large Stock of the following, are enabled to offer good, strong, healthy Plants at the annexed prices.

FUCHSIAS.—The following fine varieties of 1853, viz.: Alba multiflora, Belle of Barton, Beauty (Smith's), Collegian (Banks'), Duchess of Lancaster (Henderson's), England's Glory (Harrison's), Glory (Banks'), Incomparable, (Maple's), L'Elegant, Lady Franklin, Mrs. Patterson (Patterson), Miniata, Premier (Henderson's), Purple Perfection (Henderson's). The collection of 14 for 12s. 6*d.* A choice selection of older varieties—Agnes, Beauty of Deal, Cartoni, Crystal Fountain, Flavescens, Gem of the Season, Globosa Perfecta, Hendersoni, Nonsuch, Peculiarity, Princess, Purity, Resplendens, Splendidissima, the collection of 14 for 9s. Fine Mixed Bedding Varieties, 4s. per dozen.

PHLOXES of the choicest varieties, by name, 6s., 9s., 12s., and 18s. per doz., strong plants.

Also their choice collection of TREE CARNATIONS, consisting of the most improved continental varieties, our own selection, by name, 9s., 12s., 18s., 24s. per doz.

GERANIUMS of 1853.—Any 12 of the following choice varieties may be selected for 42s.; our own selection for 36s.; or the collection of 17 for 54s. Strong healthy plants in 48 size pots:—Dobson's Harriett, Jupiter, Spot, Vulcan; Hoyle's Attica, Albinia, Butterfly, Kulla, Lagoma, Leonora, Novelty, Portia, Zaria; Foster's Eleanor, Optimum, Rachel, Queen of May.

CHOICE HELIOTROPES.—Gem, Madame Boucharlet, Souvenir de Liege, Voltaireanum nanum, 6s. per doz.; mixed varieties of ditto, 3s.

Goods carriage free, for orders not under 20s., to all London terminuses, and to all stations on the London, Brighton, and South Coast Railway. Plants added gratis with all orders of 30s. and upwards. Post Office orders expected from unknown correspondents payable to MITCHELL & Co., or JOHN FAIRBROTHER, Brighton Post Office.

Bristol Nurseries, Kemptown, Brighton.

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of genuineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "*Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th of June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have increased so much that I must now cancel my former order, and beg you to supply me according to the list now furnished.*"

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of *Gardeners' Chronicle*, March 11.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

GERANIUMS, CALCEOLARIAS, MIMULUS, CHRYSANTHEMUMS, ETC.

THE FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

JOHN WESTWOOD, having now the largest and best selected stock of the above in the kingdom, including almost every variety known, is enabled to offer them for sale at prices unequalled.

None but healthy well-established Plants will be sent out, and all orders will meet with prompt attention, and so as to insure future support and recommendation.

J. W. has also for sale an immense quantity of Bedding and Soft-wooded Plants generally.

Catalogues sent (post free) to all parts.

N.B.—The Trade will be treated liberally and fairly.

FIRST-CLASS DAHLIAS.

MITCHELL'S DUCHESS OF SUTHERLAND AND SULPHUREA ELEGANS.

JAMES MITCHELL will send out, early in May, his two unrivalled Seedling Dahlias—DUCHESS OF SUTHERLAND, white, mottled, and edged with crimson, the most beautiful and constant Show Flower ever offered; 24 blooms exhibited at the Surrey Gardens in September, 1853, and much admired; also First-class Prize at Maidstone, by MESSRS. Neville and others; 4 feet, 10*s.* 6*d.* SULPHUREA ELEGANS, primrose-yellow, exquisite form, first-rate, and constant show flower, 4 feet, 10*s.* 6*d.*

MITCHELL'S NEW BLUE VERBENA ELEGANTISSIMA, an improvement on Mons. Paguin; the above magnificent Verbena at 2*s.* 6*d.* each. No discount, unless six are ordered.—Piltdown Nurseries, Maresfield, Sussex.

ROSE NURSERIES, HERTFORD.

EDWARD P. FRANCIS offers the following ROSES in 48 size pots, strong, healthy vigorous plants on Manetti stocks, 1*s.* 6*d.* to 2*s.* each.

TEAS.—Anteros, Gonda, Marechal Bugeaud, Le Pactole, Abricote, Pauline Plantier, Goubault, Silene, Josephine Malton, Marie de Medicis, Madame de St. Joseph, Marie de Beaux, Eugène Desgaches, Mirabile, Princess d'Esterhazy.

HYBRID PERPETUALS.—Baron Prevost, Reine des Fleurs, Augustine Mouchelet, Louis Buonaparte, Leon des Combats, Sydonie, Baron Hallez, Madame Laffay, Mrs. Elliott, Géant des Batailles, William Jesse, Duchess of Sutherland.

BOURBON.—Gloire d'Rosamene.

CHINA.—Mrs. Bosanquet.

NOISETTE.—Lamarque, Jaune Desprez, La Biche.

E. P. F. has also a large Stock of all the leading kinds of Bedding-out Plants, strong and vigorous, in 60 size pots, fit for going to a distance, from 4*s.* to 6*s.* per dozen.

SUTTON'S GRASS SEEDS FOR PRESENT SOWING.—*The importance of procuring good Seeds will be proved more this season than usual, in consequence of the extreme drought which has prevailed so long.*

We are receiving very gratifying intelligence of the crops growing from the seeds we have supplied during the last few months. One of our customers (Mr. Joseph Newton) writing us from Biggleswade, on the 15th inst., says:—"*The Grass seeds I had from you have convinced our farmers that it is better to have your selected ripe seeds than to use the unripe hay seeds, from the cow-cribs and hay-lofts.*" Having a fine stock, we can still supply seeds, which may be sown now with certainty of success, viz., Permanent Pasture Grass Seeds; Seeds for Improving old Pastures; Turnip, Mangold, and other Agricultural Seeds. Priced Lists may be had, post free.

SUTTON & SONS, Seed Growers, Reading, Berks.

ABRAHAM STANSFIELD, NURSERYMAN, SEEDSMAN, and LANDSCAPE GARDENER, Todmorden, Lancashire, having a large Stock of the following, can supply them at the under-mentioned prices:—

50 species of the genus SAXIFRAGA, at 15*s.* per 100, or 4*s.* per dozen.

400 species of select Plants adapted for Rockwork, at 30*s.* per 100, or 4*s.* per dozen.

800 species and varieties of Alpine and Hardy Herbaceous Plants, 25*s.* per 100, or 4*s.* per dozen.

150 species of Hardy and Greenhouse FERNS and LYCOPODS, from 6*s.* to 24*s.* per dozen.

SCARLET GERANIUMS and other Bedding Plants, 4*s.* p. doz.

N.B. A few bushels of genuine Fluke Potato, at 8*s.* per bushel.

Catalogues on application.—A remittance or reference from unknown correspondents.

BEAUTIFUL NEW PETUNIA.

"MONTREAL PURPLE" (SMITH.)

W. F. SMITH, Riverhead Nurseries, near Sevenoaks, will be prepared to send out, on and after May 1st, strong plants of the above splendid Petunia, at 3*s.* 6*d.* each. This variety possesses a first-rate habit, and produces fine large bold flowers of good form, well above the foliage; and it has proved to stand the wind and rain better than any other variety.

W. F. S. is confident that the above will give as much satisfaction as the Geranium "Lady Holmsdale," and Calceolaria "Beauty of Montreal," sent out by him in 1852. W. F. S. has also some splendid Plants for vases of Geraniums "Lady Holmesdale" and "Flower of the Day," from 20*s.* to 30*s.* per dozen.—Catalogues of Stove, Greenhouse, and Bedding Plants may be had on application.

BEDDING OUT PLANTS FOR THE FLOWER GARDEN.

BURGESS AND KENT, Penkhule Nursery, Stoke-upon-Trent, Staffordshire, respectfully invite the attention of the Nobility, Gentry, and others about to furnish their Flower Gardens, to their extra large stock of fine established Plants of the under-mentioned varieties, which will vary in price according to the quality and quantity ordered. All communications will receive immediate attention.

TRENTHAM ROSY SCARLET GERANIUM, a beautiful variety, of compact habit and large trusser.

GOLDEN CHAIN GERANIUM, with fine gold band round the leaf; Tom Thumb, Trentham Scarlet, Victoria, and other Scarlets; Silver-striped and variegated Geraniums, in varieties; Yellow and Bronze Calceolarias, Salvias, Pentstemons, Cupheas, Petunias, Lobelias, Mimuluses, Antirrhinums, Heliotropes, Fuchsias, Double Purple Senecio, and Verbenas in great variety.

NEW DAHLIAS, ETC.

THOMAS BARNES begs most respectfully to announce that he is now prepared to send out fine healthy plants of the following, all of which will be found deserving a place in the most limited collections.

DAHLIAS.—Show Flowers; 10*s.* 6*d.* each.

INDISPENSABLE (BARNES).—Bright clear yellow; best ever offered.

JOHN W. HEDGE (BARNES).—Lilac and purple, distinct and fine; constant.

DANECROFT BEAUTY (BARNES).—Peach-tipped rose; fine shape and centre.

NEW CONTINENTAL VARIETIES.

EVA.—Pure white shaded peach.

LE DIVAN.—Scarlet and maroon shaded.

LE GRAND SULTAN.—Black crimson, shaded rose.

MENTOR.—Lilac, with metallic shade.

OMER PASHA AMARANTH.—Red bluish shade.

GOSSIP (Fancy).—Delicate lilac, white tips; 7*s.* 6*d.*

All the leading varieties of last season, 24*s.* per dozen.

Older sorts of approved merit, 9*s.* per dozen.

Six new seedling PETUNIAS, 3*s.* 6*d.* each, or 18*s.* the set.

Three new seedling VERBENAS, 12*s.* the set.

20 Continental varieties of VERBENA, quite new, 2*s.* 6*d.* each, or 24*s.* per dozen. Descriptive Catalogues on application.

Danecroft Nurseries Stowmarket.

TURNIP SEEDS! TURNIP SEEDS!

CARRIAGE FREE.

B. PAGE AND CO.'S Genuine Stock, saved from the finest transplanted Bulbs, will, as heretofore, gain the greatest number of Prizes at Root Exhibitions.

BENJAMIN R. CANT, in offering the above, does so with the greatest confidence, as he has received several letters from customers stating that the plants sent are far better than those generally supplied by the Trade.

ST. JOHN'S STREET NURSERY, COLCHESTER.

Carriage paid to London and Norwich and all intermediate stations on the Line. Unknown Correspondents are requested to send a remittance or reference.

NEW BEDDING CALCEOLARIA "AJAX"

LUCOMBE, PINCE, AND CO. will send out, on the 24th of May next, the above splendid and new shrubby Bedding CALCEOLARIA. Its fine, strong, healthy, robust, yet dwarf compact habit, combined with a profusion of large brilliant flowers, makes it suitable either for the Parterre or Conservatory. The original Seedling Plant was exhibited by L., P., & Co., at the Horticultural Society's Rooms, Regent Street, in May, 1853, and again April 18, 1854, when the Certificate of Merit was awarded to it. The following extracts from the *Gardeners' Chronicle* render further description unnecessary:—

Extract from the Report of the Horticultural Society's Meeting, May 24, 1853, page 342.

"LUCOMBE, PINCE, & Co. *exhibited a Calceolaria called Ajax, (yellow with brown blotch), which, having a stiff good habit, and multitudes of showy blossoms, will doubtless make a good bedding plant.*"

Report of Meeting of April 18, 1854, in the *Gardeners' Chronicle*, page 255.

"MESSRS. LUCOMBE & PINCE *received a Certificate of Merit for Calceolaria Ajax, a dwarf, shrubby, bedding kind, remarkable for its great trusses of brown and yellow blossoms, which require no sticks to support them, owing to their sturdy habit. It was stated to be from Sultan crossed with some high coloured shrubby variety.*"

Good small plants, per doz.	42*s.* 0*d.*
Extra strong plants, each	7 6

Exeter Nursery, Exeter, May 6.

GRASS SEEDS, ETC.

THOMAS GIBBS AND CO. (the SEEDSMEN to the Royal Agricultural Society of England), corner of HALF-MOON STREET, Piccadilly, beg to draw attention to their Grass Seeds for Laying down Land to Permanent Grass. The Seeds which they employ in forming the Mixtures for various soils are well cleaned under their own superintendence.

Mixtures for Permanent Meadows and Pastures
,, Parks or Pasturage in sight of Mansions
,, Irrigation on Water Meadows
,, Renovating Old Swards
,, Fine Garden Lawns, Cricket Grounds, &c.
,, two or three years' lay.
RYE-GRASS—Italian, very fine sample
,, Dickinson's Italian do.
,, Pacey's Perennial and Evergreen
,, Annual or Common.
CLOVERS—Red, White, and Alsike
,, Trefoil, Red Suckling, &c.
CARROTS—Large White Belgian
,, Field, Altringham, &c.
MANGOLD WURZEL—Long Red
,, Orange or Yellow Globe, and other sorts.
TURNIPS—Swedes, Purple Top, Skirving's, &c.
,, Hybrids, Gibbs' Green Top
,, Globes, Tankards, &c.
FARM SEEDS of all descriptions.

Priced Lists, Detail Catalogues, and other information can be obtained on application to THOMAS GIBBS & CO.

The Gardeners' Chronicle.

SATURDAY, MAY 6, 1854.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY, May 13—Horticultural Gardens..... 2 P.M.

COUNTRY SHOWS FOR THE MONTH OF MAY.—15th: Hammersmith Pansy.—18th and 19th: Exeter.—23d: Handsworth and Lozells.—24th: Nottingham and Colchester.—25th: Derby.—26th: Bury St. Edmunds.—29th: Hunslet.—30th: Truro.

THE appearance of a new Blue Book concerning the ROYAL FORESTS is, we presume, an indication that Mr. DRUMMOND'S promised motion upon the subject of their management is not likely to be long withheld. Under these circumstances our duty to the public will be best performed by reporting what it is that the new volume contains.

The return opens with a letter from Mr. KENNEDY to the Treasury, dated the 20th June last, urging the necessity of "a searching enquiry into the whole subject (of the forest management) by persons in no way influenced by previous opinion, or pledged to any line of proceeding either in defence or disapprobation of the present state of affairs." To this no answer has been given.

Next follows a Treasury minute calling Mr. KENNEDY to account for having presented to Parliament a report such as the Treasury does not approve of; together with Mr. KENNEDY'S reply, in which he endeavours to show that the Treasury had no ground for some of its assertions, and that he would not have fulfilled his public duty had his report been what the Treasury desired. These two letters should be carefully read; for they form the key to all which follows, through nearly 300 pages. A letter from Mr. WILSON, at p. 16, completes this matter.

Then come 20 pages of correspondence respecting the employment of Mr. JAMES BROWN, of Arniston, in enquiring into the state of the Royal Forests, and reporting thereupon. The substance is this. The Treasury complains that Mr. BROWN was employed without due authority, and objects to pay the charges incurred in consequence; Mr. KENNEDY replies that his employment was indispensable to the service; that he (Mr. K.) had no confidence in Mr. CLUTTON'S reports, upon which the Treasury was in the habit of relying; that he was satisfied that no such income as the Royal Forests are capable of yielding would ever be realised under their present management; and he proceeds to prove by figures that better advice and assistance than Mr. CLUTTON'S were required. He further objects to a Treasury doctrine that the Royal Forests and revenues "ought to be exempted from that searching supervision which they seem to require;" he declares his inability to perceive that the Royal Forests "enjoy any immunity from good management, or are privileged to be mismanaged," and he shows that it has not been considered necessary to obtain special authority

from the Treasury to engage persons professionally upon every occasion where they are required; in proof of which, he produces 48 instances of the practice since 1851, among which Mr. John Clutton is paid 27*l.* 19*s.* 5*d.*, and Messrs Clutton and Driver 975*l.* 12*s.* To this last view of the case the Treasury demurs. Next succeeds a long correspondence ending in the appointment of Mr. Brown to the Deputy Surveyorship of Dean, "during pleasure," *vice* Machen resigned; he finding sureties, as recommended by Mr. Kennedy, to the amount of 4000*l.* And this part of the Blue Book concludes with an order from the Treasury to pay to Mr. Brown the 291*l.* 6*s.* 11*d.* to which he was entitled.

The third and fourth heads are called Mr. Brown's and Mr. Clutton's reports upon Dean Forest and the New Forest. We despair of conveying any intelligible idea of this part of the return, filling 120 pages. For the present, therefore, we shall only say that in part the correspondence relates to forest squabbles between A.'s man and B.'s man; and in part to the way in which forests should be practically managed. To some of these points we shall doubtless advert hereafter. Messrs. Clutton and Brown cannot agree; they each state their opinion at length, and among them may be elicited, by an arboricultural reader, much useful information. For ourselves we generally prefer the views of Mr. Brown to those of Mr. Clutton "whose resolute defence of the mode of management which has brought about this inferiority" (in the New Forest) Mr. Brown assigns "either to ignorance or to prejudice, and a desire to maintain the antiquated system of the forest."

A fifth chapter is occupied by Delamere. Mr. Kennedy writes to the deputy surveyor, Mr. Lipscombe, on the 10th January last, dismissing him from his office. Mr. L. expresses his astonishment, professes his inability to understand upon what ground he is discharged, and memorialises the Treasury. Mr. Kennedy being called upon by the Treasury to explain does so at length, and shows that he could not possibly have acted otherwise.

Chapter 6 treats of Bere and Parkhurst. The remarks above made concerning Dean Forest and the New Forest apply in many respects to this, which, like them, will probably receive some attention from us hereafter. We must, however, at once say that the correspondence of the deputy-surveyor, Sir James Campbell, is not calculated to inspire much respect. He would do well to study Mr. Higinbotham's style.

At last we arrive at p. 207, and what concerns Alice Holt and Woolmer Forests. Here we have once more opinion *versus* opinion. Mr. Brown and Mr. Higinbotham cannot agree. But at this point occurs a new incident. They not only cannot agree in opinion, but they are directly at variance about facts, which we should have thought easy enough to verify. B. declares that he finds 160 trees per acre, to which H. replies that they are fewer than 100. B. returns their average diameter at 7 inches, H. asserts that it is rather more than 10. B. says that the forests are undrained, or ill drained, or partially drained. H. rejoins that they are drained, well drained, thoroughly drained; that, in fact, he has 239¾ miles of drains in his forests. And so on. Of course B. is called upon to reply to H. But in the meanwhile, Mr. Kennedy writes a very strong letter to the Treasury, pointing out what he conceives to be misrepresentations on the part of H. This letter goes to H., who maintains his entire accuracy, says that the Rt. Hon. gentleman's charges are serious and unfounded, and substantiates his assertions by a number of affidavits from woodmen, magistrates, and others; among whom are found Sir Archibald Macdonald, and Mr. Paine of Farnham. While this is going on Mr. Brown revisits the scene of dispute, by command of the Treasury; and on his return repeats all his former assertions, with some additions (the letter will be found at p. 234), contradicting H. as flatly as words enable him. Among other things he repeats that H.'s (239 miles of) drains are comparatively worthless. Of course this elicits another reply from H., who holds to all his former statements, declares that B.'s mode of taking averages is fallacious, and supports himself as before, with a quantity of corroborative testimony. Among the new witnesses is found Mr. Ross Donnelly Mangles, M.P.

This series of correspondence brings us down to the 28th February last. On the 2d March, Mr. Kennedy proposed that the matter should be referred to some independent tribunal; thus reiterating a request he urged upon the Treasury without effect on the 20th June, 1853. At last, on the 31st March, we find a Treasury minute appointing Mr. Mathews of Edgbaston House, Birmingham; Mr. Murton of Tunstall, Sittingbourne; and Mr. Menzies, the deputy surveyor of Windsor Park, referees in the matters of fact included in the proceedings between Mr. Kennedy and Messrs. Brown and Higinbotham. The result of the reference is not given in the Blue Book before us. Who the two first gentlemen may be we do not know; Mr. Menzies, a crown-officer, can scarcely be regarded in any other light than as a Treasury agent, which is unfortunate.

Since the above was written a rumour has reached us that the report of the referees is so entirely against the accuracy of the statements made by Mr. Brown, that he has been removed from his office in Dean Forest. But of this the Blue Book says nothing. It is also announced by the *Daily News* that Mr. Kennedy has resigned his Commissionership. What has led to this we shall doubtless know in due time.

It is our melancholy duty to announce the decease of Dr. Wallich, who expired, in the 68th year of his age, at his house in Gower Street, on the 28th ult., after a long illness. The name of our departed friend is so indissolubly associated with the history of modern horticulture, that we must be permitted to dwell, although for much too short a space, upon the sad event which has deprived science of one of her most ardent disciples.

By birth a Dane, Dr. Wallich entered the medical service of his country when very young, and was, in the year 1807, attached as surgeon to the Danish East Indian settlement of Serampore. When this place was taken possession of by the English, such of the Danish officers as desired it were permitted to enter the service of the East India Company, an advantage of which Dr. Wallich availed himself, and this circumstance ultimately led to his arriving at the highest botanical position known in India. His extensive acquaintance with plants soon attracted the attention of the Indian Government, especially at a time when very few of the Company's servants had any knowledge of the subject. Upon Dr. Hamilton's resigning charge of the important Botanical Garden at Calcutta, in 1815, Dr. Wallich was appointed superintendent, and from that time forward his activity in collecting plants from all parts of our Indian empire, in describing them, causing them to be drawn, and in dispatching live specimens of them to his adopted country, was unexampled. From 1818 to 1828 there was scarcely an English garden of magnitude which was not much indebted to his liberality. In 1820 we find him, in conjunction with Dr. Carey, commencing the publication of Roxburgh's "Flora Indica," which was greatly augmented by his own discoveries. As soon as the new art of lithography was made available in India, it was seized upon as a ready means of bringing the world acquainted with the little known plants of Nepal, and the "Tentamen Floræ Nepalensis," a folio work with plates, made its appearance. For this, large materials had been accumulated during the author's official examination of that province in the year 1820. In 1825 he was deputed by the Government to inspect the timber forests of Western Hindostan. In 1826 and 1827 he was in Ava and the newly acquired Burmese territory. In 1828 the state of his health, which had become greatly impaired, rendered his return to Europe inevitable. Then it was that he brought with him visible proofs of his never tiring zeal in the pursuit of science. Eight thousand species of plants collected by himself, together with an incredible number of duplicates, safely arrived in London, and were speedily, at his recommendation, dispersed through the public and private herbaria of Europe and America. The East India Company sanctioned this great operation, with a noble spirit defraying the whole cost, in a manner most honourable to themselves. At the same time that the laborious work of distribution was going on, Dr. Wallich's magnum opus, the "Plantæ Asiaticæ Rariores" was passing through the press, and eventually, in August 1832, formed three folio volumes, each containing 100 coloured plates.

Shortly afterwards Dr. Wallich returned to his official duties in India, where he was appointed to the chief direction of a scientific party directed to explore the newly acquired province of Assam, especially with a view to determine the nature of the Tea cultivation that had been ascertained to exist there. Ill health still pursued him, and after a visit to the Cape of Good Hope, and a further attempt to struggle against a climate which had always proved his most dangerous enemy, he finally bade adieu to Hindostan, and reached England with his family in the year 1847, to enjoy—alas! for too brief a space—the repose and honours to which he had gained a just title by a most arduous life.

By those who knew him intimately he will be much regretted, for he was not only an enthusiastic botanist, and a learned man, but a charming companion, as well as a warm and steady friend.

VEGETABLE PATHOLOGY.—No. XVIII.

78. It has been stated (No. 67) that the denuded surface of the alburnum, if protected from external agents, and we may add from minute fungi, is capable of originating a new growth of wood and bark, so that in the end, if no fresh injury arise, the wound is completely healed, and the growth of the tree proceeds as before. M. Trécul has lately shown (Annales des Sciences Naturelles, Oct. 1853) that the denuded surface of the young bark (in the Elm for example) is no less capable of giving rise to a similar growth, and this whether the strips of bark separated from the stem are torn upwards or downwards, and are connected therefore with the tree above or below. In either case new wood and bark were formed, so that each strip of bark comported itself like a distinct tree, with its centripetal and centrifugal mode of increase. The new surface was moreover thickly studded with adventitious buds.

79. Extensive decortication is not therefore necessarily destructive to trees, neither is a deep annular incision penetrating through several layers of wood, and cutting off all communication by the bark or infant wood. New wood also and bark may be formed where there is not a single leaf, as in the case of vigorous trees cut off level with the ground. Many such instances are on record, but none more remarkable than that described by Göppert* in the Silver Fir (Pinus picea, &c), in which case there was an inosculation with the roots of other trees. In some other described cases no such inosculation was possible.

80. Though the pith and its annular sheath perform a very important office in the early stage of growth of the branches, while some varieties of pith retain their vitality and doubtless some active functions for years, and though the destruction of the pith in young shoots is fatal in some cases, even after the first year's growth, still after a lapse of time the whole may be destroyed, together with the surrounding tissues, to a very considerable extent, without impairing the vitality of the trees considered as a whole; witness the enormous Chestnuts of Sicily, the ancient Yews in several of our churchyards, and instances without number of a similar kind in our fields and hedgerows. It is certain, too, that after a lapse of years, when the walls of the cells have become hardened with woody matter and their cavity almost obliterated, they retain a very low degree of vitality, though it is far from being the fact that heartwood is totally unable to transmit fluid matter, though it may not be sufficiently active by itself to satisfy the exigencies due to the rapid perspiration of the leaves when in full vigour, under a burning sun. The medullary sheath, then, except so far as its functions may be discharged by the rays which proceed from it, can only be regarded in any general view of the phenomena of vegetation, like the pith which it encloses, as a temporary structure, especially when we are considering the important question of the course taken by the nourishing fluid in vegetables, whether in its way upward to the leaves, or downward to the roots.

It is clear, then, that the fluid which is imbibed by the spongelets from the soil, and is carried upwards by the tissue of the roots to the stem, is not carried from thence by any exclusive set of organs. It may be carried in some cases by the pith or the surrounding tissue, by the alburnum or young wood, by the older rings where the more recent ones have been destroyed, or even by the bark itself, as appears by No. 78; and therefore we may safely conclude that all the tissues more or less concur to the production of the one great end, though some may be more active than others. Indeed, where fluid moves by the effect of endosmose and exosmose, wherever there is an ascending current, there must co-exist in some degree a reciprocal and simultaneous descending current. *M. J. B.*

ERANTHEMUM PULCHELLUM.

When properly managed this is an extremely useful plant, forming, as it does, large compact specimens in a short time, and producing bright blue flowers for many weeks in succession during the winter months. It, however, requires the temperature of an intermediate house to have it in perfection; for unless it is afforded a heat of some 50° the flowers are never sufficiently numerous at one time to render it effective.

Cuttings made of young wood in a rather firm state, planted in sandy soil, and placed in a gentle heat, strike root readily. When sufficiently rooted, pot them off singly in small pots, placing them in a pit or frame, where a warm moist shady atmosphere is maintained, until they have become well established. Like all plants from a warm climate, this delights in a gentle bottom heat; and if that can be afforded to young plants, they will grow with astonishing vigour, forming fine broad healthy foliage, which no insect will venture to attack. They should, however, be placed near the glass, and afforded a moderate circulation of air on fine days, with all the light possible, except on the forenoons of very hot days, when a slight shade for a few hours will be beneficial. Attend to shifting as the pots become filled with roots, giving liberal shifts; and unless side shoots are formed near the base of the plant, pinch out its top; but the habit is such that this will seldom be necessary. It will be expedient, however, where the object is to grow large specimens quickly, to keep the shoots well

* "Annales des Sciences Naturelles," sér. 2. Vol. 19, p. 181, translated from the German, published at Bonn in the previous year.

tied out until a good foundation is secured; and even afterwards the use of a few sticks to regulate the main branches, so as to admit light and air among the foliage, and preserve the plants in form, will be useful. Syringe liberally on the mornings and afternoons of bright days, and be careful to keep the plants thoroughly moist at the roots, giving manure-water in a clear, rather weak state, frequently.

Plants intended for blooming should be so managed as to have their growth completed by the end of September, and should be kept rather dry at the root, and cool for a month, which will effectually check all tendency to the formation of wood, and prepare the specimens for blooming. After allowing a short period of rest, give them a liberal supply of water at the root, placing them in a temperature of 50° or 55° when flowers will soon be produced in abundance. Under the most favourable circumstances the individual blossoms are not of long duration, and care should be exercised to prevent their being injured by damp, and to remove them as soon as they fade, otherwise the decayed flowers will greatly detract from the beauty of the finest specimen. After blooming, cut back the shoots severely, leaving only sufficient wood to form a good foundation, and place the plants in any spare corner of a pit, or wherever they will be safe from frost, and give no more water to the soil than will suffice to prevent its becoming very dry. In the case of old plants, from which only a moderate growth is expected, it will be unnecessary to start them into growth until towards June; but young plants may be started after allowing them about a month's rest. Old plants should be turned out of their pots, reducing the ball, so as to be able to re-pot in fresh stuff in the same sized pots, placing them in a nice, moist, warm temperature, to induce free growth, but avoid over-watering at the root at this stage. If thrips make their appearance upon the plants, and they are somewhat liable to this pest during the early stages of their growth, apply tobacco smoke, in moderate doses, on two successive evenings, which will entirely destroy the thrips.

Good mellow turfy loam, mixed with a little well decayed cow-dung, or leaf soil, and a portion of clean sharp sand to keep it porous, will be found more suitable for the growth of this plant than a lighter compost. *Alpha.*

Home Correspondence.

The Frost on the 25th ult.—Ever since the spring of 1846, inclusive, we have had, in the south of England, more or less frost, so as to destroy in a great measure the crop of fruit, but we have scarcely had one so disastrous in its effects as that above alluded to. At this place, 25 miles to the east of London, Pears and Plums commenced to bloom about the second week in April; in the immediate neighbourhood of London they were 10 or 12 days earlier; the weather was dry and sunny (with cold nights the thermometer registering two to three and four degrees of frost), and apparently highly favourable for the setting of the blossoms of fruit trees; for Apricots, Peaches, and Nectarines against walls, and Plums, and Pears, on standards, had set the most abundant crop I have seen for very many years; Greengage and other Plums have bloomed most freely, and would have been plentiful as Blackberries. On the morning of the 24th there was a severe hoar frost—thermometer registering 28°, but not even the young leaves of the Fig and Walnut were injured. In the day some showers of sleet looked ominous, and on the morning of the 25th all the hopes of the fruit-growers in the south of England were destroyed. The thermometer registered 25°, or 7° of frost, and all the wall fruit, where not heavily covered, is destroyed, and the fruit of Pears, Plums, and Cherries, on standards, which had set, and were swelling rapidly, have turned black, and are dead; the Apple blossom, although not all expended, seems irreparably injured; and so another barren fruit year has to be added to our long list of failures, commencing in 1846, in which year the spring was remarkably early, so that Primroses and Violets were in bloom Feb. 7, and Roses showed their bloom buds on the 27th of the same month; on March 20th, 14 degrees of frost destroyed nearly all the fruit; the blossom buds were all frozen through, so that the bloom never expanded properly, and proved all barren. Allow me now to quote a few lines from my journal. "1847. April 16. Ten degrees of frost; the blossom buds of fruit trees not yet burst; are they injured? The Marie Louise and all the more delicate sorts of Pears were destroyed; of the hardy common Pears there was a good crop. 1848. April 1, 2, 3, 4. Most beautiful weather. Pears coming into full bloom, and everything rapidly advancing. April 27: Sharp hoar frost; thermometer registered 27°; Pears, Plums, and Cherries nearly all destroyed. 1849. March 16. An early spring; Crocuses and many spring flowers off bloom. April 18. Pear trees in full bloom. A sharp wind frost; thermometer registered 19°, or 13 degrees of frost; Pear and Plum blossom nearly all destroyed. 1850. April, cold, dry, and favourable for the fruit trees blooming. May 3. A sharp hoar frost; thermometer registered 23°, or nine degrees of frost; Pear, Plum, and Cherry blossoms all destroyed. 1851. Feb. 6. Crocuses in full bloom to the end of this month; the weather was mild, dry, and very agreeable. April 26, 27, and 28. Sharp hoar frosts; thermometer registered 25°, or seven degrees of frost; fruit blossoms which are not yet open seem uninjured. May 8. Pear trees of most sorts in full bloom. May 14. Severe frost; thermometer registered 25°, or seven degrees of frost; Pears, Plums, and Cherries all destroyed. 1852: April 19. Pear and Plum trees in full bloom; frost severe; thermometer registered 20°, or 12 degrees of frost; no Pears, no Plums, no Cherries—a perfect failure. 1853: May 16. Pear and Plum trees in full bloom; the weather cold, raw, and damp, but no frost; the blossoms all dropped off, after apparently setting their fruit; no Pears, no Plums, no Apples, no Cherries." 1854 has now to be added to the above melancholy catalogue. I wonder if we shall ever again have a good fruit season. I did hope that, after the seventh failure, we should this season have abundance. These failures in the fruit crop have not been confined to the south of England; it is years since they have had a good fruit season either in France or Belgium; and the frost of the 25th ult. has doubtless been as fatal there as here. [It is reported to have killed the young wood in all the Vineyards near Bourdeaux.]. To the market gardeners in the neighbourhood of London these eight consecutive failures must have been an enormous loss; let us hope that the failing cycle is now over. I remember, some years since, after several years of abundant crops of fruit, making the remark, "that I could not understand why the climate of England should be called precarious with regard to fruit culture, as every season gave us abundance." We have now therefore only to look forward to the good time coming. *T. R.*——The thermometer here on the night in question did not indicate more than 5° of frost at 11 p.m. I may mention, however, that we are situated on a slope to the south, and are well sheltered from the north. I never remember to have seen vegetation so advanced at this period. Nevertheless fruit trees have escaped wonderfully. Pears, Plums, Cherries, and Peaches, were all well set; many fruit of the latter are now as large as Walnuts, and many of the young shoots are 12 and 14 inches long. Apples, being in full bloom, are not quite so safe, but I have observed that many of the essential parts of the flower are quite uninjured, and I think we may expect an average crop. The young shoots of Vines, under the protection of glass alone, have been destroyed. The more tender kinds of Roses have been injured. Fuchsias just emerging from the soil have been cut off. Potatoes above ground have all been killed; the sun rose so fine while they were frozen, that they were withered and black by eight o'clock. Strawberries in the neighbourhood, in exposed places, have suffered severely, although our own have not. The young shoots of the common Fig are in many places killed. We have had a most unusually dry spring, which was in favour of May plants. *D. Pressly, Knockmaroon Lodge, near Dublin.*——The recent frost, which has injured, and in many cases destroyed, the blooms in the open air, which were not protected, has not done the slightest injury in my orchard-house—even Geraniums stood it. This is the general result in short spring night frosts; long winter frosts are very different. I lost all my Ixias this year, which were in pots, and far from the glass. *S. B.*——On the morning of the 25th ult. the thermometer stood at 22° on the ground—a dry border—exposed all day to the full sun; this was about half-past 4 o'clock. The blooms of the earlier kinds of Strawberries are ruined, and the young leaves quite black; some Belgian varieties given to me last autumn by Mr. Rivers, and Trollope's Victoria, were covered with a double thickness of Haythorn's net, but these have suffered as much or more than any others. The leaves of the later kinds are all brown at the edges. *H. Doubleday, Epping.*——The only things that have suffered here are Box edging and Spanish Chestnuts. Out of about 200 fruit trees, consisting of Pears, Apples, Apricots, Peaches, Nectarines, Plums, &c., not one has suffered the least damage. This place is about 400 feet above the level of the sea. *J. Daniels, Woodside, Frant, Sussex.*——In this part of Scotland we had only about 2° of frost on the night of the 24th ult. Our Apricots and Peaches, which are about the size of Pears, on the open wall, escaped unhurt, as did also Cherries and Plums, which were in blossom. Large bushes of Fuchsia globosa, which had wintered safely unprotected, have been greatly cut up, more especially this year's growth. A plant of Dielytra has been flowering beautifully with us in the open border for the last six weeks; it suffered but very little on the night in question. *John Macpherson, Castle Semple, Renfrewshire.*——All the Potatoes in this part of Ireland have been cut down to the ground. The young growths of the evergreen, Turkey, and weeping Oaks, Deodar, Pinus cephalonica and Brunoniana, common and Portugal Laurels, Box edgings, common Yews, Olea europæa, common and flowering Ash, and Weigela rosea, are also all destroyed, and the Gooseberry and Currant crop is very much injured. *J. O. H. Haycroft, Cork.*

Garden Seats.—Every one finds great difficulty in keeping garden seats more than a year without constant painting. Gutta-percha thinly laid on, and turned round the sides and nailed, will last for ever, and looks dull and garden-like, and costs no more than one painting. *Somerset.*

Walls.—An idea prevails that the north wall is least favourable for stone fruit trees, and requires the hardiest sorts; but it seems to me to catch more copious gleams of sun from the west than the east wall does from the east. My gardener (unaware what my impression was) expressed the like opinion, viz., that the north wall was preferable of the two. How is the fact? *A. H.*

How to obtain Potatoes free from Disease.—I have been successful in producing sound crops by the following course of culture:—I procure as early and good kinds of Potatoes for sets as I can get, omitting all the very latest varieties. My next object is to plant so that the crop can be properly protected and saved from blight when the tubers are grown; I therefore grow my Potatoes in beds, which I find to yield the heaviest and finest crop. The sets, which are cut, are sprouted on the hard floor of some sheltered shed, where they can have plenty of air and light. Here I cover them over with some dry mould or coal ashes, in order that they may grow and root, and they remain in this condition until the second or third week in May, when they are planted. After preparing the ground for them, mark out the beds 6 feet in width, and any length the land will afford, leaving the alleys between the beds 3 or 4 feet wide. The Potatoes are put in at 1 foot square, keeping the rows straight. The land being planted, growth will soon become strong, and a little earth will be required, which must be supplied from the alleys. When properly earthed, which should be done at twice, the plants may be left to grow undisturbed. Watch carefully for disease, and the moment it is perceived lose no time in cutting off the haulm and clearing it away. Then sprinkle lime, sulphur, soot, or salt over the beds, and cover them over with earth from the alleys, 5 inches deep, allowing the middle of the bed to be highest, in order to throw off rain, and keep the Potatoes as dry as possible. The whole may now be left with safety. In this way the tubers will keep as sound as possible, and a bad one will scarcely be found. *J. G. Knell.*

Spring Protection of Wall Trees by Means of Water.—For the information of your correspondent (see p. 269), I beg to say that I have tried the following plan with success; viz., to place a pailful of water on the coping or anywhere about the top. Then get a hay or straw rope, or, what would be much better, a strip of woollen cloth, one end of which put into the water, and the other fix in the border at 6 or 7 feet from the bottom of the wall, and right over the centre of the tree; the rope will keep itself sufficiently wet to attract the frost from 4 to 5 feet each side. *D. Pressly, Knockmaroon Lodge, Dublin.*

Mildewed Strawberries.—I am inclined to believe that soil as well as situation has much to do with this evil; and as to size of pot, I think 7-inch ones decidedly too large for early forcing. The Black Prince is not so strong a grower as Keens' Seedling, and it should only have one plant in a 5-inch pot; and even in the case of Keens' Seedling for very early work I would use the same size. I have forced the Black Prince from the time it first came out, and I find it most useful for early work, beating, as it does, Keens' Seedling by a month; in fact it will force at a time when the latter will not; this season I gathered my first fruit on new year's day; the plants were moved from the Melon frames in the beginning of November, and set along the back shelf of a Pine pit. They were soon in full blossom, and set a fine crop, which ripened well. To the inexperienced I would say, take the earliest runners. Pot them in 5-inch pots for early forcing, using nothing but good sound turfy loam. Pot rather firmly, and look to the drainage; when well rooted place them on a south border, with a view to induce early maturity. Do not set them so closely together as to obstruct a free circulation of air. Remove them under glass before heavy autumn rains set in, giving plenty of air on all favourable opportunities, but very little water till forcing begins. *M. Busby, Stockwood Park.*

New Materials for Paper, Linen, and Cordage.—The sample of fibrous matter which I sent you lately is the bark of a species of Mallow, a biennial plant, which stands unscathed our stormy ungenial climate all the year round, and at the present time (April) it is in full vigour and beauty, being almost the only green thing to be seen. It grows most luxuriantly in the very bleakest situations, close to the shore, upon poor bog or sandy soil, and even on raised banks, exposed to pitiless storms of hail, salt spray, and other disadvantages, except frost, of which we have very little. It grows from six to eight, and even ten, feet high, and from eight to ten and twelve inches in circumference, branching out, if it has room, like a shrub, and having a thick fibrous bark. If cultivated as a crop, however, it would grow straight and free from branches, to whatever height might be deemed best for the purposes for which it might be wanted. It might be cultivated easily and cheaply, and it produces seeds in abundance. If assisted to get ahead of the weeds it will afterwards take care of itself. If, then, it grows so well under such adverse circumstances, what might it not do if cultivated with care on good land and in a favourable climate. The fibrous part can be easily separated from the stem by children, after it has been cut or pulled up, and half macerated, as it were, or exposed to the dews. Of the exact average of fibrous matter I am uninformed, but, compared with other species of Mallows, Flax, or Nettles, it must be great indeed. Now, there are many thousand acres of unproductive bog in the Barony of Ennis, and other parts of Mayo, west of Ballina, which might be profitably employed in producing this plant, if it should turn out upon trial to answer the purposes of the rope, coarse linen, or paper manufactures. *William Billington, Roy, Belmullet, Mayo, Ireland.* [The plant referred to in this communication is the Tree Mallow, Lavatera arborea. The Spanish botanist, Cavanilles, obtained pretty good cordage from it, and it is stated that some experiments at Toulon resulted in the production of a similar quality. We have no idea that it can be used where much strength is required; but its long fibre, if white enough, would answer well for mixing with substances of shorter staple in paper making. What Mr.

Billington should do is to get a pound or two of the fibre prepared and sent to London for inspection by paper makers, who will then give him an idea of its market value.]——Several years ago you inserted in your journal a suggestion from me, in which I had the two-fold object of suggesting a material for the manufacture of paper, and of inducing the farmer to keep his land free from weeds, by finding a market for them. There is little doubt that many of our commonest weeds have a fibre well adapted for making paper; and now that the demand for that article is so much increased, it seems, from some late communications to your journal, that it may even be profitable to cultivate some of those weeds. A large supply, however, may be obtained for some time even from our roadsides, without resorting to their cultivation; and even our stagnant pools may supply some, for I have found in a dry summer the water of a shallow pond has evaporated and left the ground covered with a sheet of paper — for literally paste of the dried, bleached, and matted Confervæ, might have been at once used as such, as I will take an opportunity of showing you, having preserved a specimen of this natural paper; and doubtless the same substance might be adapted to the use of the paper-maker, who, it has struck me, on seeing the high-water mark on our shores white with bleached heaps of Zostera, might also meet with a large supply of material from that source. The roots of Quickens, and other Grasses, which are generally destroyed in this country when raked off tillage land, though when washed they might supply a nutritious fodder for stock, for which purpose they are sold in the markets in some parts of the south of Europe; judging from the toughness of their fibre, I should think they would also be found very useful for paper making. To show you that besides the well-known asbestos, other minerals might also be applied to paper making, I enclose you a sample of a natural paper which may be found in the fissures of the red marl rock of the south of Devon. It is, I believe, formed of sulphate of lime in minute interlacing fibrous crystals. This specimen I took out of the cliff at Seaton, in Devonshire, and I have deposited some in the British Museum. *W. C. Trevelyan, Wallington.*

Effects of the late Winter on Coniferous Plants.—I venture to subjoin my own experience of a collection commenced some four years ago. The subsoil of the district is chalk, but there is a very considerable depth of loam. The situation is high and rather exposed. Cedars of Lebanon quite untouched; of the Deodars, those sheltered have quite escaped, those more exposed have lost their leaves, but now (in May) they exhibit little traces of it. The variety of Deodar called viridis is, I fear, killed. Cedrus atlantica hardly touched. Cryptomeria japonica and C. Lobbi quite uninjured. The following are all looking very well. P. excelsa, Cembra, Laricio, Calabrica, Monspeliensis, monticola, apulcensis, Lindleyana, ayacahuite, Sabiniana, Lambertiana, tuberculata, ponderosa, mitis, macrocarpa, brutia, pumilio, Clanbrasiliana, Montezumæ, pyrenaica; Abies orientalis; Pinus rigida, pyrenaica, Lemoniana, and other varieties of Pinaster; Hamiltoniana, Escarena; Picea Pindrow, Webbiana, Pinsapo, cephalonica, Pichta, nobilis, grandis, morinda, Khutrow, taurica, and Nordmanniana. The following, somewhat in a sheltered position, have stood very well: Pinus Benthamiana, macrophylla, Teocote, Pseudo-strobus, Russelliana. P. halepensis, a little touched but recovering; P. Hartwegi, a little pale but does not seem hurt; of the P. insignis two or three are dead, but others sheltered look well; P. radiata is uninjured; P. muricata is much injured, but is recovering; P. Gerardiana, one injured and the other looking very well; P. Llaveana, just touched; Juniperus chinensis, J. excelsa, and J. Bedfordiana, quite unhurt. Of the Cupressus torulosa two are dead, and two do not seem materially injured; C. Uhdeana, two dead. The Thuja tribe has stood very well. Cupressus Goveniana has stood well, C. funebris not so well. Cunninghamia lanceolata looks satisfactorily. The Cedar tribe generally seemed to have escaped injury. Cypresses have mostly suffered; many are killed; some most exposed have escaped. Laurustinus, Arbutus, Bay, killed to the ground. Common Laurels uninjured here; in the lower situations killed to the ground. Ilexes, many killed, and all much injured. Yews, English and Irish, untouched. *W. P. Hamond, jun., Pampesford Hall, near Cambridge.*

——The following Conifers have proved themselves perfectly hardy in this district during the past winter: Abies Douglasi, Menziesi, morinda, orientalis, pumila, Wittmanni; Araucaria imbricata, Cedrus atlantica and Deodara, Cupressus funebris, Goveniana, Lambertiana, torulosa, and Uhdeana; Juniperus Bedfordiana, chinensis, excelsa, hibernica, and squamata; Picea cephalonica, nobilis, Nordmanniana, Pindrow, Pinsapo, and Webbiana; Pinus Cembra, cembroides, Edgariana, excelsa, Gerardiana, insignis, macrocarpa, radiata, and Sabiniana; Taxodium sempervirens, Taxus adpressa, Dovastoni, fastigiata fol. aureis and argenteis, and pyramidalis. *Youell & Co., Great Yarmouth.*

Planting Oak.—The discussions on the subject of planting which have appeared in your columns will be attended with the greatest public benefit, by spreading information which is greatly needed. The loss by injudicious planting and mismanagement of plantations must be reckoned by millions, besides the vexation and disappointment. Not 1 acre in 20 brings any trees to perfection; and yet planting is capable of being reduced to an exact science. Trees are susceptible of measurement while standing, and their rate of growth ascertained, and so a pretty accurate estimate of their age can be formed. On being cut down the annual circles may be counted, so that each tree may be said to contain within itself a record of its history. I will confine myself to a few remarks on Oak planting, and afterwards apply them to the Royal forests. All soils and exposures do not suit the Oak; the natural growth of the trees in the hedgerows and woods of the neighbourhood furnishes the best criterion. The next question is, what number of trees will an acre bring to perfection in a given period—say a century? Not that an Oak attains its full stature in that period, but it is a long time to look forward to, and will furnish a fine useful tree. My observation induces me to fix that number at 40. Then such a number should be planted as by thinning out half at a time will leave ultimately (at about 50 years) 40 standards. This number is 2560, at 4 feet 1½ in., or a quarter of a perch apart. At the first thinning they will be reduced to 1280, at the second to 640, at the third to 320, at the fourth to 160, at the fifth to 80, and at the sixth and last to 40. Now, as to nurses for them, where the site is well sheltered they need none; but if not, the Larch is by far the best; its light and delicate spray neither overshadows the Oak nor, when waved by the wind, does it break its succulent tender branches, as the Ash, Beech, Scotch Fir, &c., do, especially the leader, which retards its growth and spoils its form. It may be advantageous to plant a screen of the Pine and Fir tribes to afford shelter to the young Oaks from prevailing winds, but it is always injurious to mix them. Then as to the age of the Oaks. From some examples I have seen I am almost inclined to prefer sowing Acorns; but the younger the plant the better if succeeds; two-year-old seedlings perhaps are the best. I planted 10 acres with these and an adjoining piece, precisely similar in every respect, with plants of five or six years old and as many feet high. Both have taken very well, but in the intervening 30 years the younger plants have overtaken the larger ones. Some of them are a yard in girth; the average is perhaps 30 ins. at 3 feet from the ground. An inch annually is about the average growth of the Oak on a suitable soil, when it has had space enough for its natural expansion; but early and copious thinning is the great promoter of growth, and neglect of it, the great destroyer of woods. The forester should not say, "My trees are thin enough now," when he has just thinned them out; but he should be able to say, "My trees stand far enough apart not to interfere with each other, till the next period of thinning comes round." I consider that a young Oak requires 4 inches annually for its expansion in diameter. In about 12 years, therefore, his neighbour, having by that time become an evil, must be removed. In a few years more, half the Oak must follow, and so on when their tops meet. Now, as to our national forests, with what object should they be suffered to continue? Certainly not with a view to profit; for the nation is not more likely to grow Oaks with pecuniary advantage than Wheat. Their object is to have a supply of Oak timber available during time of war, when there may be a difficulty or impossibility of obtaining timber from abroad. They should be husbanded as a resource for such a contingency. The national existence may depend on it. The first step is to cut away all Beech, Ash, &c., and all ill-shaped, cankered Oaks, such as are not likely to be fit for naval use; for a bad tree should not occupy the place of a good one; both cannot grow on the same place at the same time. No land should be retained for forest, the soil of which is not capable of rearing the best timber, or which is not situated convenient to some great dockyard. Oak seemed to me to grow better about Dean Forest than any place I have ever seen; the New Forest also produces very good for about two-thirds of its extent; as to Chopwell Woods, Delamere Forest, and nearly all the rest, the sooner they are sold the better. On those which are retained, let not the annual profit, but the ultimate supply, be the consideration proposed. I applaud your efforts to promote the naturalisation of the Deodar and other hardy foreign trees of merit. I wish you would extend your advocacy to the Huon Pine of Van Diemen's Land, the foliage of which is very beautiful and the wood of superior quality, and the Kauri tree of New Zealand; both of which would flourish at least in the mild south-west of England, and prove highly ornamental and useful. *J. B., York.* [They both require a *very* mild climate.]

Common Things: Fungi.—Those persons who have had the privilege of inspecting the schools at Hitcham, under the guidance of Professor Henslow, have been much delighted and surprised at the accurate knowledge which has been acquired by the children, of the plants of their neighbourhood. The truth, however, is that there is nothing to which children can be so easily trained as any pursuit connected with natural history; and it would be a great benefit to the poor, were a knowledge of vegetable productions, together with their real virtues and properties, more generally diffused; for many a dangerous and fatal mistake would be thus avoided, not to mention any more immediate beneficial effects, or the mental improvements acquired by a habit of close and accurate comparison. Much of the success of Mr. H. Cuming, in the Phillippine islands, was due to his power of interesting the younger branches of the population in his researches, and we have just received a very interesting letter from the banks of the Rio Negro, one of the larger tributaries of the Amazon, far in the interior of South America, announcing the transmission of a valuable collection of fungi made principally by the young Indians. The following extract from the letter will be read with much interest:—"The Rio Uaupés is the first locality in which I have met with fungi in tolerable plenty, though the number of individuals is not at all to be compared with what I recollect having seen in England in Fir-woods and other places during the autumnal months; indeed of many of the species I did not succeed in finding more than one or two specimens; and of those gathered in greater quantity the specimens were mostly found growing widely apart, and were collected at several times. The most interesting species, and the greatest variety, are found in what the Indians call the Caá-guaçú, or great forest, where the trees are lofty and the soil good. Some of the fungi of the Caá-guaçú grow on the ground; more on dead trunks, standing or fallen; but perhaps the greatest number of species is found on dead leaves and twigs, being principally Agarics and Marasmii, some of the former being so minute and so deliquescent as to be impossible to preserve. On the Uaupés, as on the Alto Rio Negro, there is a very large proportion of low forest, on a soil of dry white sand, mostly thinly covering the granite rock, which, although equally a 'silva primæva' with the Caá-guaçú, produces only small trees of peculiar species found nowhere else, and shows here and there bare white places, destitute of all vegetation, from which the Indians of Brazil call it Caa-tinga, or the white forest; on the Venezuelan side of the frontier it is called simply Monte bajo, or low forest. The fungi of the Caa-tinga are chiefly terrestrial stipitate Polypori, growing subgregariously, and including a good many forms with differences so slight that they are probably all reducible to four or five species. The Gapó or periodically inundated forest afforded me a good many species growing chiefly on decayed wood. In the Mandiocca-roças and Capoeiras (deserted roças overgrown with young forest), several species occur on burnt logs, which have apparently a wide distribution in tropical America, and some of them are possibly cosmopolites. One of these, which seems to be P. sanguineus, I have seen in similar situations all the way up from Pará, and it is generally accompanied by two sessile Agarici. In the whole collection the genus Polyporus is vastly predominant, and I think it not impossible that if I could have remained at Panuré the whole winter I might have got 100 species in this genus alone. The collection would have been by no means so large had I not been aided in its formation by nearly all the juvenile population of Panuré, the boys being incited to the task by presents of fish-hooks and Jews' harps, and the girls by beads and looking-glasses. The girls were by far the most expert in the search, having, as it would seem, more patience than the boys. Their name for fungus is Dychtíbaki, in the language of the Tucana Indians, which is spoken throughout the lower half of the Uaupés, but in the Lingoa Geral, spoken throughout the Amazon and Rio Negro, it is Urupé. At the Jaguaraté-cachoeira [Tiger cataract], I am told that in the height of the wet season two species of fungi were eaten, and I was shown the place where they grew, which was under the shade of Umarí* trees such as the Uaupé Indians are accustomed to plant near their houses for the sake of the fruit, but at that time (Nov.) no trace of the fungi was visible, and I could only conjecture from the description given me that one of them was an Agaricus, and the other something like Fistulina." *M. J. B.*

Foreign Correspondence.

The Frost of the 25th ult. at Brussels.—From the 14th March to the 22d April the weather was unusually dry, and the temperature kept rising, as with you. In spite of northerly and easterly winds the sun brought Peaches, Apricots, Plums, Pears, and Cherries into flower in the first fortnight of April. By the 22d April all the fruit trees except Apples and late Cherries had set, and commenced swelling their fruit. On that day we had a violent storm and heavy rain; after which the thermometer fell from 63° to 46°, and to 39° during the day of the 23d. On the 24th, about 11 P.M., the thermometer marked 29½°, and the next morning, about 5 A.M., 26°. Since the 26th there has been a constant succession of rain and violent wind from the N.N.E. and N.W. This morning the wind has shifted from W. to S. The thermometer has risen successively to 41°, 45½°, and 51° in the open air in the shade. I have waited till now to report the condition of our fruit gardens. Mine is beyond the city; the soil is light and deep; it is exposed to all winds. This is the result. All the varieties of Pear reputed to be hardy, and raised from seed in this climate, have preserved the fruit which had begun to swell before the frost. But delicate varieties, or such as had been raised from seed in a better climate, will most of them fail. The Apple crop, of which a part only had blossomed, is in a more doubtful state. The Plums and early Cherries, as well as the race of what are called Griottes, have cast their calyx [and are safe?] But of Bigarreaus and late Cherries as much cannot be said. Among a lot of Apricot trees, open standards, raised from seed of the Gros Abricot d'Hollande, two trees have saved all the fruit that was stoned; and the same has occurred to some open standard Peaches of the variety called here Pêche d'Oignie. Vines in the open ground have lost all their young wood, which was frozen. These facts seem to show the prudence, in this Belgian climate, which is as variable as your own, of growing in preference hardy varieties. And it has been towards obtaining the latter that

* Trees belonging to the genus Humirium, fom whose bark a perfume is extracted, much esteemed in Brazil, and the wood used in house carpentry, especially for rafters.

the extensive experiments of Van Mons, Esperen, Bouvier and others have been directed. Their results have been fortunate and are beginning to be appreciated in this country, where the seasons are very like yours. In the gardens I have inspected, within and without the city, the facts appear to be of the same nature. I think too, that if the dry weather had lasted much longer, it would have committed more mischief among the young fruit than the frosts and heavy rains, which last are required to give the trees strength enough to carry their crops. It appears, moreover, that such fruit trees as had set and swelled their fruit, if grafted on wild stocks (*greffés sur franc*), and planted in a light soil, retain a sufficiently high internal temperature to resist 6° or 7° of frost. *J. de Jonghe, Brussels, May* 2.

Societies.

Horticultural, *May* 1 : Anniversary.—Sir Philip de Malpas Grey Egerton, Bart., M.P., in the chair. The following new members of Council were elected ; viz., General Fox, John Claremont Whiteman, Esq., and the Rev. W. B. L. Hawkins, *vice* the Duke of Northumberland, Sir Peter van Notten Pole, Bart., and R. S. Holford, Esq., retired. His Grace the Duke of Devonshire was re-elected President ; J. R. Gowen, Esq., Treasurer ; Dr. Royle, Secretary ; and as Auditors, Messrs. J. C. Stevens and Henry G. Bohn. The annual report from the Council was read, and, upon the motion of C. Wentworth Dilke, Esq., was adopted and ordered to be circulated among the Fellows.

Linnean, *May* 2.—The President in the chair. Professors Miquel, Van Beneden, and Duméril, and MM. J. D. Dana, C. A. Meyer, and J. F. C. Montagne, were elected foreign members of the Society. The necessary business of the meeting having been disposed of, the President proposed that, in consequence of the recent death of N. Wallich, M.D., Vice-President of the Society, and in consideration of his long connection with, and eminent services to, the Society and to Natural History, the meeting should adjourn ; which was unanimously agreed to.

Notices of Books.

Dr. Hooker's Flora of New Zealand.—Part V. is occupied by Cryptogamic Botany, and in part by Ferns. The same high talent manifested in the previous number is conspicuous in this. The learned author perseveres in the destruction of the so-called species of name-makers, and with constant success. Some of our German friends must shudder as much at the name of Joseph Hooker as red-tape men formerly did at that of Joseph Hume.

An Essay on the Relations between Labour and Capital. By C. Morrison. Longmans. 8vo, pp. 328.

The extreme desirableness of sound views amongst the working classes on the general principles of political economy, and particularly on those which govern the rate of wages, is too obvious to be doubted at any time, but most especially now that strikes and lock-outs have assumed so important an aspect. If working men were convinced, as they would necessarily be, if acquainted with such principles, that the rate of wages does not depend upon and cannot in the long run be controlled by acts of Parliament, awards of arbitrators, mediation of indifferent persons, or anything except the efficient demand for labour as compared with the amount of it which is to be had, strikes, and with them lock-outs, would cease to disturb society.

The object of the author of the present essay is to impress these important truths upon those who are disposed to doubt them, and to point out both what will not and what will relieve the poorer classes from the evils which oppress them. The writer's views, condensed into a few sentences, are as follows ; the lowest possible rate of wages, consistent with its continued supply, is that which barely suffices to maintain the labourer ; the highest possible rate is that which exhausts the funds applicable to the payment of wages. Between these two extremes alone can wages fluctuate. If the number of labourers requiring work is great as compared with the work for them to do, wages will approach the low limit ; if, on the other hand, there is much work to be done and few persons to do it, their wages will approach the high limit, and will be high in proportion as the number of labourers is few, and the funds for their payment are large. To improve wages, consequently, population should decrease and money accumulate. Emigration is an immediate and the only available mode by which the evils arising from excessive population can be quickly removed ; although, to prevent their recurrence, prudence in marrying seems still indispensable. These propositions are enforced by the author at considerable length, but he does not so clearly show how capital is to be increased, nor does he satisfactorily deal with the great question now at issue between masters and their men ; viz., the laws which determine the relation between wages and profits, or show that the views of strikers are altogether visionary when they suppose that the former are too small compared with the latter. The author reasons upon the assumption that all the funds available for the payment of wages are in every case so employed, whilst, if we mistake not, a belief, just or unjust, that the contrary is the fact, is very general among strikers. Their whole contention is that the masters subtract in the shape of profits too much from the funds which would otherwise be available for the payment of labour.

We point out what appear to us to be the main defects in the essay, in the hope that they may be supplied on some future occasion. Notwithstanding the omissions thus adverted to, the author has produced a work deserving careful perusal ; for his statements are clear, and his lengthened examination of the modes in which the condition of the poorer classes cannot and can be improved, is, in many respects, excellent. We do not believe that the working classes are aware of how much can be done by themselves for their own advancement, and books like that before us, which show them this in a kind spirit, cannot have too wide a circulation.

New Plants.

60. Cymbidium pendulum, *Swartz—var.* atropurpureum.

A Borneo plant, in the possession of John Knowles, Esq., of Manchester, which has lately produced its flowers, proves to be a narrow-leaved variety of this species, with deep purple sepals and petals, and yellow ribs to the lip. It is far handsomer than the older varieties. The same form is before us, collected by Cuming in the Philippines. The species seems to be a native of all the insular parts of Asia within the tropic.

61. Desfontainia spinosa, *Ruiz and Pav. Fl. Peruv. II. 47, t.* 186—*alias* D. splendens, *H. B. K. ; alias* D. Hookeri *Dunal ; alias* D. acutangula *Dunal.*

This most beautiful evergreen bush was introduced some years ago by Messrs. Veitch, but has only of late found its way into the channels of trade. Conceive a plant so like a Holly that one can scarcely believe it not to be one, bearing scarlet flowers between two and three inches long, tipped with bright yellow. It is now figured in the "Botanical Magazine," t. 4781, where it is well represented, except as regards the colour of the leaves, which are made glaucous, a tint we have never remarked. Here, again, we have an example of the preposterous habit of making species, with all the paraphernalia of learned names, out of nothing—literally nothing. Like other plants growing in different climates, and at various elevations, this Desfontainia, which grows wild from New Grenada to Staten Land, in 53° south latitude, may be found in herbaria in slightly different states, just as in any coppice you may find the common Holly in all sorts of forms. Out of this *nihility* three species have been produced. A more profitable employment than covering paper with unmeaning phrases would have been the determination of the affinity which this plant naturally bears to others, a point upon which there has been nothing as yet settled. It is commonly regarded as a doubtful Gentianaceous genus ; but its 5-celled ovary is fatal to the suggestion. Dunal puts it at the end of Solanaceæ, which is surely a very false step. Alph. De Candolle suggests Polemoniaceæ, to which its habit and the structure of the seeds are quite opposed. The writer of this notice once referred it with doubt to Aquifoliaceæ, but its many-seeded ovary and opposite leaves were great objections. Nevertheless, he regards it as certain that the genus must stand somewhere in the Gentianal alliance, and he would now suggest that it is really a connecting form between Aquifoliaceæ and Loganiaceæ, including Cassipoureæ, referable to the latter, however, on account of its polyspermous fruit. The anther is singularly like that of Fagræa morindæfolia, as given by Blume in his Rumphia.

Garden Memoranda.

Royal Botanic Garden, Kew.—The effects of the frost on the night of the 24th ult. have been here, as elsewhere, severely felt. The young leaves and tops of the Aucubas are black and quite dead, and even many of those of the common Laurel are little better. The flowers and young shoots of Ribes sanguineum have been destroyed, and the foliage of all the Himalayan Berberries, except Wallichi, which had not pushed, has been greatly injured. The young leaves of Magnolia purpurea are quite black, and the flowers have been injured so much that they will not open. The young shoots of Eucalyptuses, all of which had been sadly cut up last winter, and which had just begun to push afresh, have been killed. The young tops of the common Hydrangea are quite dead ; and the flowers of Wistaria chinensis have suffered severely. The Weigela, too, has not escaped unhurt. The young leaves of Spiræa Lindleyana have been killed, and Chimonanthus fragrans, against a wall, has been injured ; the same plant, in the shape of a bush on the open lawn, has been very much cut up ; the young leaves and tops of the common Walnut tree are quite black, and the shoots as soft for some distance back as if they had been boiled ; a fine specimen of Sophora japonica is in a similar condition ; and Turkey Oaks, Ornus europæa, Platanus orientalis, Laurus Sassafras, and Robinia Pseud-acacia are all more or less in the same state. The newly made wood of Deodars, more especially on very young trees, has been nearly all killed ; but that on large specimens which had pushed but little has suffered less, and some trees have even altogether escaped. The young growths of Abies Smithiana are killed, as are also those of Abies Webbiana ; which is, however, injured every year by even moderate spring frosts. The different species of Veratrum have had portions of their foliage frosted quite black, and Uvularia puberula has been greatly cut up, while U. grandiflora beside it has escaped unhurt ; Telekia cordifolia has had its leaves browned. The American Eupatorium purpureum and its associates verticillatum and maculatum have all been killed, and even young portions of the common E. cannabinum can scarcely be said to have altogether escaped. Polygonum Sieboldi against an east wall is unhurt, while in a west exposure it has been killed, as have also been P. cuspidatum, Brunonis, and speciosum ; Aralia nudicaulis is slightly injured ; Macleaya cordata has been destroyed. Some Epimediums and Clematis tubulosa have also suffered ; Arunda Donax, which had been pushing vigorously, has been killed down to the ground. Several of the Sikkim Rhododendrons, such as cinnabarinum, glaucum, ciliatum, Falconeri, Thomsoni, fulgens, and Wallichi, which had wintered safely out of doors, have been so greatly injured by the frost of the night in question, that it is doubtful if some of them will recover, and even the young leaves of Dalhousianum under glass have been browned a little, so very tender is this fragrant species. With this exception, however, no other plants under glass here have suffered. All young annuals and other things from seed that had made their appearance above ground have been killed completely.

At Ealing Park comparatively little injury has been done. Of the many fine specimen Deodars on the lawn, the young shoots of only three or four of them have been killed. The rest appear to be very slightly, if at all injured.

At Gunnersbury the young tops of Box edgings have been killed. Wall trees here have also sustained some amount of injury, but not so much as in many other places. Where Peaches had been protected by coping-boards 15 inches wide they appear to be safe ; but a few of them are killed where they had no protection. Of Cherries one half at least is dead. The early blooms of Strawberries have also been cut off. Figs are to all appearance safe.

In several small gardens in the neighbourhood of Twickenham we learn that the Potatoes have been killed down to the ground, and that young Cauliflower plants have also received considerable injury.

In the *Garden of the Horticultural Society*, at Chiswick, Moutans have not been injured. Pavia californica in full leaf is also uninjured ; P. indica has had all the young growth destroyed, and the Indian Acer caudatum is in a similar condition. Ceanothus verrucosus, in full bloom, is uninjured, as are also Berberis Darwini and empetrifolia ; Spiræa prunifolia flore pleno, in full bloom, is likewise uninjured ; Calycanthus occidentalis has had all the young growth killed ; the Assam Tea, although not hurt last winter, has had its young growth killed, as has also Taxodium sempervirens ; the Chusan Palm has not been injured in the least ; the Sikkim Rhododendron ciliatum and cinnabarinum are uninjured in the foliage, but the flower-buds have been killed ; Magnolia purpurea and all the deciduous species have had their young growths and flowers destroyed ; the newly-made wood of Deodars has been partially injured, while Cryptomerias are not hurt in the least ; the old leaves of the Pampas Grass got browned by the winter, but the young ones are found to be growing, and have escaped uninjured ; Pinus Benthamiana, tuberculata, muricata, Fremontiana, Lindleyana, Montezumæ, and monticola, and Abies Nordmanniana and orientalis have not suffered in the least ; nor has Fitz-Roya patagonica or Cupressus Goveniana, macrocarpa, Uhdeana, thurifera, and funebris. Syringa Emodi has had all the young wood killed, as have also Azaleas ; Abies Brunoniana is nearly killed, and all the young growth of A. Webbiana has been destroyed. In a north aspect, Camellias have escaped ; Quercus Branti, infectoria, and two other Koordistan Oaks that were not injured in the least by the winter, have had all the young growths killed, and in all probability the plants down to the ground ; Quercus agrifolia has had its young wood killed, as have also common English Oaks ; Araucaria imbricata is unhurt ; Arbutus procera, which had had its leaves partially browned by the winter, although in full flower, has not been injured in the least by the last frost. Planes have had all their young growths destroyed, as have also common Laurels and Celtises.

FLORICULTURE.

Early Tulips.—In many places these are beautifully in bloom, and for the amateur of limited means they are a valuable tribe of spring-flowering plants. They are cheap, and easy to cultivate, requiring but little attention, and while they annually adorn the flower-clump, or sitting-room window, their numbers will increase, until the only difficulty will be to find room for them. During April and May they add an inexpressible charm to the flower-border, and do not withdraw their unequalled colours and sweet perfume until their place can be supplied with the usual bedding-out plants. What for instance, can be compared with a bed of the Tournesol for the regularity of surface, and the splendour of its two distinct colours ? Next in size and beauty is a single variety called Keizar Kroon, which is indeed a noble flower. It has a very bright yellow ground, flaked with a vivid scarlet, and is in every respect "Queen" of the single early Tulips. Rex Rubrorum is a double variety of a brilliant crimson, also very large ; a bed of it presents a very regular surface, and long continuance of bloom. Royal Standard is a pleasing flower, with a pure white ground, beautifully flaked with carmine, making a striking contrast. Belle Alliance is another single flower, very attractive, of a vivid red colour, a self. The new scarlet Van Thol is very similar to it, but it has this

difference, that it very often breaks into a flaked flower, orange and red. Grand-master of Malta and Bride of Haarlem are very similar in colours, having both pure white grounds, distinctly striped, and flaked with bright crimson. Alida Maria is a flower in the same style, but very dwarf in habit. Superintendent is a fine kind, white, with a violet flake; Conqueror is double and has the same colours. The best double pure white is La Candeur; as single whites, White Swan and Pottebakker are the best. Amongst yellows we have the yellow Van Thol, dwarf and showy, the yellow Pottebakker, and the old Double Yellow, which is rather later in flowering. From February till May they may be also easily had in flower for the window. In forming a small collection, the following varieties are suitable to begin with:—Van Thol, single and double; Rex Rubrorum, Tournesol, Florentine, and Mariage de ma Fille. The outlay for a dozen of each of these varieties will not exceed the cost of one dozen of first-class Hyacinths, and while the latter have to be bought annually, these will last for years. I would advise one-half the quantity obtained to be planted in autumn, in the flower-border, where they will bloom in spring, and will be in a fit state for potting for the window next season. The soil in which they are planted should be rather light and rich, and ought to be well loosened to the depth of 15 inches at least; for although they will grow and flower if stuck into any soil, they will yearly become weaker and fewer in number, until they ultimately disappear altogether. In planting, the roots should be placed about 5 inches apart, and covered with about 2 inches of soil. They require no protection, and no further care, except a few stakes to support the taller growing sorts, and to have the surface of the soil stirred occasionally. As soon as the leaves decay, the roots may be taken out of the ground, and placed in a dry place for a time, in order that they may get thoroughly dry before they are put into their winter quarters. Any cool dry place will answer for this purpose; but mice are apt to make sad havoc among them, so keep your eye upon them. I also find it necessary to guard them against the ravages of these vermin in the ground. It is often necessary to remove them as soon as they have done flowering; and in this case I lift carefully, retaining as much soil with their roots as I can, and place them in a shady situation, covering them with soil to about the depth they formerly occupied. If the weather is dry, give them a little water; here they will ripen their growth, and will receive little injury from their removal. These ought to change places with the portion which has flowered in the window, as they will be found apt to become weak under pot culture, and if the same roots are used two successive seasons, they will probably be of little account the second; this will not, however, be a necessary consequence, but is generally the result of using small pots, and otherwise treating the plants unnaturally. For window decoration, plant in pots as soon as the bulbs are procured, using 7-inch pots for the purpose; put in each five roots of Van Thol, or three of the other sorts. After potting, they should be placed in some spare corner out of doors, and covered about 2 inches deep with coal ashes, or any material which can be easily removed. Here they may be allowed to remain till about Christmas, when a portion may be removed to the greenhouse, to forward their blooming season. The Van Thol is the earliest, and ought to be treated as such, except variety is desired; in that case, take Rex Rubrorum and Tournesol; these will be in flower in February, and, if properly tended with water, &c., will retain their gaiety for at least a month. Of course provision must be made to keep up a succession of bloom. When done flowering, early Tulips must not be turned out of doors, nor otherwise maltreated; they must be allowed a place in a frame or greenhouse, where they can go gradually to rest. It will not be necessary to give them much water after flowering; but do not allow them to be without it until the leaves show symptoms of decay, then gradually withhold it altogether. Afterwards give them the treatment directed to be given those grown in the flower-border,

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Azaleas as they go out of bloom should have their seed-vessels picked off, and those that require more pot room should be shifted at once. Some persons recommend mixing a portion of loam in the soil for these; but strong rich fibry peat, with plenty of silver sand, forms the best compost for them. After potting, every plant should be neatly staked and tied before taking it out of the potting shed; for, besides that this is better done at once, it will not occupy half the time, as if deferred until the plants have made their growth. These beautiful plants are exceedingly subject to thrips, and unless a sharp war is carried on with these pests immediately they make their appearance, it will be difficult to subdue them. To avoid the nuisance of having to smoke houses or pits, have a light frame of a convenient size covered with oiled calico, in which to smoke the plants. This may be placed over the infested plants in any of the houses, or on a bed of coal-ashes out-doors, and filled with tobacco smoke by means of the fumigator, and allowed to remain for a few hours. If the calico is properly put upon the frame, every insect to which tobacco-smoke is inimical will be destroyed, for not a breath of the smoke can escape. We find this simple cheap contrivance very serviceable and economical, as very little tobacco serves when the smoke cannot escape, and it is a great comfort to be able to smoke plants without being obliged to inhale the disagreeable fumes. Go over the conservatory frequently, to regulate growth, and to see that the borders are kept moist, giving a thorough soaking when necessary, for mere surface waterings will not reach the roots; and although useful in keeping the atmosphere moist, will not serve to maintain the vigour of the plants after this season. Young stock of hard-wooded plants should now be growing freely, and will require assiduous attention to do them justice. Afford them a moist atmosphere, and as warm as they will bear, without making weakly growth, but aim at securing short-jointed strong compact wood, and regulate the temperature so as to secure this. Examine every plant closely two or three times a week, and keep them frequently turned round and stopped, &c., as may be necessary, and see that they are properly supplied with pot-room and water at the root. Any plant in middling health, if at all liable to the attack of red spider, must be closely watched, and syringed as may be necessary. It is better, however, to lay such plants on their sides, on a clean mat, giving them a good washing with the syringe, than to trust to ordinary syringings, which are apt to render the soil too wet, and in many cases fail to accomplish the desired end. Stove.—Let the inmates here have plenty of light, warmth, and moisture, and a moderate circulation of air whenever the weather will admit, and attend regularly to stopping and training as may be required, and do not allow young stock to suffer for the want of pot room. Give weak tepid manure water to all plants that enjoy it, but do not dilute it too much for Allamandas, Clerodendrons, Stephanotis, and similar rapid growing gross feeders.

FORCING DEPARTMENT.

Pinery.—Where a regular supply of fruit is required at all seasons of the year, it will be necessary to frequently examine the stock of plants, marking those desired to show fruit, so as to be able to keep them dry at the root for a month or so, which in most cases will have the effect of checking growth and throwing the plants into fruiting. The only effectual method, however, of securing a supply of fruit at the desired season, is foresight in the management of the stock, so as to have the plants strong and well matured, and be able to allow them a short season of comparative rest, after which there will be no difficulty about getting them to show fruit. With plenty of convenience this is easily enough managed, but where the accommodation is limited it is the most difficult part of the culture of the Pine. And in such cases it will be safer to grow the plants in pots, so as to secure perfect command over the roots, and also be able to move the plants from a warmer to a cooler pit, or otherwise, as may be necessary. Black Jamaicas and Cayennes are the best varieties for winter use, and the stock of these should receive every encouragement at the present season, to induce them to make free growth at present, and a portion of them should be shifted into their fruiting pots as soon as possible. Vineries.—In cases where Muscats are grown in the same house with Hamburghs, and other free setting varieties, the temperature must be kept sufficiently high during blooming, and until the berries are fairly set to suit the Muscats; for a crop of these cannot be depended upon from the most healthy Vines, unless they can be afforded a brisk temperature while in bloom and setting their fruit. It will be better, however, to risk having the Muscat bunches somewhat thin than to injure other varieties by maintaining a night temperature of 75°, which is the practice of some good growers: 68° or 70° will be found quite sufficient. Get the borders prepared for planting out young Vines, and if these are started into growth before planting do not keep them too warm, or it will be difficult to prevent their sustaining a check after planting out. Peaches.—Where the fruit is approaching maturity the atmosphere should be kept rather dry, with a free circulation of air, whenever the state of the external atmosphere will admit.

FLOWER GARDEN AND SHRUBBERIES.

Now that we have showery and somewhat mild weather, this department will afford ample employment for all the strength which in most cases can be concentrated upon it. Hardy annuals must be sown at once, covering them lightly with fine soil; Stocks, Pentstemons, Antirrhinums, Hollyhocks, &c., that have been properly hardened off, should be planted where they are to bloom, as also any remaining stock of biennials and perennials. If the removing of any large shrubs or trees has been delayed through the late unfavourable weather, this also should be done immediately. The planting of tender Roses should not be longer delayed, and those previously planted must be examined, replacing those that appear to be much injured by the weather. Get bedding stock hardened off as expeditiously as possible, but in removing them from the pits and frames place them where they can be covered at night in case of necessity, and also take care that they are not injured by too sudden exposure to bright sunshine. Be particularly careful that the stock is perfectly free from green-fly before removing it from under glass. Encourage any backward stock to make free growth, in order to get them strong before planting out time, for it is useless planting out until the plants are some size and well established. Take advantage of showery weather to give the Grass and walks a good rolling, and endeavour to maintain perfect neatness in this department.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Persevere in the destruction of insects, and use every means to prevent the young shoots being injured; for if they sustain any check at the present season they will not soon get over it, and the wood will be made late; and unless the autumn should prove favourable it will not be possible to get it well ripened. In cases where tobacco-water cannot be easily obtained, a mixture of flowers of sulphur and Scotch snuff applied with the sulphurating machine will be equally efficacious; but this should not be applied on a showery day, unless the trees can be covered to prevent its being washed off too suddenly. Do not be in too much haste to remove the covering, as a sharp frost is by no means unlikely while the present unsettled weather continues. A good bed of silver-skinned Onions should be sown on poor soil, in an open situation, making the ground firm, and sowing thick. These will afford a supply for Salads, and come in useful for pickling. Put in during showery weather Turnips for succession; also Beet, Salsafy, and Scorzonera, if not already done. See to keeping up a succession of Cauliflower plants; also Lettuce and small Salads.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending May 4, 1854, as observed at the Horticultural Gardens.

April and May.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth 1 foot deep.	Temperature. Of the Earth 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 12th, 1833—therm. 81 deg.; and the lowest on the 11th, 1838—therm. 27 deg.

Notices to Correspondents.

Blight Composition: *A Dowling.* Your letter was an advertisement.‡

Books: *Lover of Botany.* The "best botanical book on Coniferæ" is Endlicher's "Synopsis Coniferarum," a systematical work in Latin, without figures.—*Flora.* We know of no such book as that you inquire for.

Cleaning Kid Gloves: *Alice.* The "Pharmaceutical Journal" recommends the following for this purpose:—Add 15 drops of strongest solution of ammonia to half a pint of spirits of turpentine. This should be applied with a brush, followed with some fine pumice powder ‡

Cyclanthera pedata: *H B.* It will succeed with you if you treat it as you would a Melon. ‡

Fish: *J P Brecon* will feel obliged by some of our correspondents informing him what is the best food for fish in small ponds where they are kept for use, and must be had when wanted, often at a very short notice.

Hollies: *G W.* By no means fork up the roots. Place the manure over the latter, in the form of a mulch, and top dress with light soil.

Hotbeds: *S F.* Cinder-ashes put on the top of your bed will not assist fermentation; but they will help to keep the heat in the bed from escaping. ‡

Insects: *Heckington.* The insects sent are the common Otiorynchus sulcatus, very injurious at this season, especially after such a long dry season, to buds on Vines, Roses, and other trees. See answers to correspondents in last week's paper for the best means of destruction. *W.—Shem.* Mr. Curtis's paper on the genus Myrmica and other ants, referred to in the report of the Linnean Society, will be printed in the Transactions of that Society, the parts of which are purchasable through the ordinary channels. *M.—T T A.* The little grubs within the withered Apple-blooms are those of the Apple weevil, Curculio (Anthonomus) Pomorum. The beetles will hatch in a few weeks. The best means of destruction are to pick off and burn the withered blooms, so as to destroy the insect before it arrives at the perfect state; or, if left till that time, the trees should be violently shaken, sheets having been laid on the ground, and the beetles which will fall should be collected and destroyed. *W.*

Lilies: *A H.* The hardiness of L. giganteum and Wallichianum is not as yet perfectly ascertained.

McGlashen's Transplanting Machines: *Tyro.* You will find full information as to prices, &c., of these machines in a pamphlet on the subject published by Messrs. Young, of Parliament Street, London. September, as we have often stated, is the best month for transplanting all kinds of evergreens.‡

Names of Plants: *J Randall.* Prunus Padus, the common Bird Cherry, and Cratægus Crus galli.—*A P.* The tree "from the East Indies" in the open ground, 15 to 20 feet high, in your grounds at Plymouth, and now in flower, is Fricsia racemosa, a native of New Zealand.—*F D. & Co.* Prostanthera lasianthos. —*L L.* Adoxa Moschatellina.

Pawlovnia imperialis: *P.* This has flowered several times in the Jardin des Plantes at Paris. If memory does not deceive us, the plant stands at the foot of the hill covered with Coniferous trees.

Villarsia: *A H.* We have no doubt that all the exotic part of this genus will live in the water out of doors, in a reasonably good climate here, during summer; but they will not bear our winters.

Misc.: *S B.* The question is more complicated than it appears to be. Light, warmth, and dryness, are no doubt material elements in causing fruitfulness; nevertheless, although a season be remarkably dark, cold, and wet, there may be an extraordinary bloom in the succeeding year, if there was no crop the previous year. Although spring water is sometimes injurious when used for watering plants, yet we suspect it is often less suitable than rain water, rather than positively injurious. This, perhaps, arises from the latter containing gaseous matter and ammonia in some abundance, while spring water has little or none. We are not aware that the sulphate of lime contained in hard water does harm, except to such plants as naturally dislike calcareous matter, such as Heaths, Rhododendrons, and the like.—*P G.* The numbers are out of print.

THE SEWAGE DEODORIZING AND PATENT MANURE COMPANY.

STOTHERT'S PATENT.

PROVISIONALLY REGISTERED UNDER 9TH AND 10TH VIC., CAP. 110.

CAPITAL £100,000, in Shares of £1 each.

(OF WHICH NOT MORE THAN 25,000 SHARES WILL BE ISSUED AT PRESENT), TO BE PAID IN FULL ON ALLOTMENT.

APPLICATION WILL HEREAFTER BE MADE FOR A CHARTER OF INCORPORATION.

PATRONS.

The Marquis of Breadalbane, K.T.
The Marquis of Stafford, M.P.
The Earl of Essex.
The Earl of Scarborough.
The Earl of Erne.
The Earl of Yarborough.
The Earl of Gifford.
The Earl of Mulgrave, M.P.
Lord Clarence Paget, R.N.
The Rt. Hon. R. A. Christopher, M.P.
Sir Arthur Aston, G.C.B.
George Tomline, Esq., M.P.
&c. &c. &c.

Directors.

The Hon. J. W. Fortescue, 17, Grosvenor Square (*Chairman*).
The Hon. R. E. Howard, Garden Court, Temple.
G. T. Braine, Esq., 8, Hyde Park Terrace, and 1, Royal Exchange Buildings.
G. P. Irvine, Esq., 15, Pall Mall.

John Carnac Morris, Esq., F.R.S., 10, Mansfield Street, Portland Place, late H.E.I.C.'s Civil Service.
Newton S. Scott, Esq., 5, Lowndes Street, Belgrave Square.
J. E. Stephens, Esq., 17, St. James's Place, Manager of the London and Eastern Bank.
With power to add to their number.

Bankers.

Messrs. Herries, Farquhar, & Co., St. James's Street.
The London and Eastern Bank, 36, King William Street, City.

Agricultural Chemist—William White, Esq.

Solicitors—Messrs. Vallance & Vallance, 20, Essex Street, Strand.

Brokers—Messrs. Medley Brothers, 15, Old Broad Street.

Secretary—Mr. W. F. Mould.

Temporary Offices—37, Charing Cross.

Model Works—Northumberland Wharf, Northumberland Street, Strand, where the experiments may be seen daily from 12 to 2 o'clock.

THIS COMPANY has been established for the purpose of carrying out the valuable invention patented by Mr. HENRY STOTHERT, for Deodorising the Sewage of towns, and for applying the same in the most approved form to agriculture.

The invention has for its objects:—

1st. The immediate deodorisation of all sewage matter, contents of cesspools, drains, &c.

2d. The conversion of these valuable matters into a light and portable manure, made up in the form of a dry brick, and perfectly free from odour.

This Company, therefore, seeks to improve the sanitary and agricultural condition of the country by the profitable use of that refuse which at present spreads disease and death around us.

The process by which these results are obtained being simple and inexpensive, the manure (the fertilising power of which is universally acknowledged) can be sold at a very moderate price.

Two objects are attained; for whilst the escape of offensive odours and consequent pollution of the atmosphere is prevented, the ammonia and other volatile principles are fixed, and placed in a condition most eligible for the food of plants.

It has long been admitted that these form the most important points in sanitary improvements, giving health where disease exists, and producing a revenue from those principles which are now wasted.

Before submitting these facts to the public, Mr. STOTHERT'S process has undergone a critical analysis by eminent chemists, and their reports fully bear out the assertions of the Patentee, as to the value of his invention and its advantages to society.

A Pamphlet can be obtained at the Offices of the Company, which explains generally the nature of the invention, and the steps which have been taken to test its usefulness and value, both in a sanitary and in an agricultural point of view, as also the practicability of its application.

Model Works have for some time past been erected over the great sewer at the Northumberland Wharf, in the Strand, where the Machine may be seen in operation daily. This simple Machine—which instantaneously deodorises the offensive sewage matter, precipitates the solid parts, and throws off the supernatant water as clear as crystal—has been inspected by many noblemen and gentlemen interested in sanitary and agricultural questions, who have testified to the completeness and efficiency of the process, and expressed their approval of the arrangements, both chemical and mechanical.

Favourable arrangements have been made for the purchase, by this Company, of the entire patents for the United Kingdom.

The Share Account of the Company will stand as follows:—

Total Capital		£100,000
Of which—To the Patentee in cash in reimbursement of expenses incurred	£6,500	
To the Patentee in Shares	6,500	
For present working capital	12,000	
		25,000
Reserved Shares—For the Patentee, but not to be issued until after payment of a dividend of 10 per cent. on the whole capital	12,000	
Ditto after 20 per cent.	12,000	
Ditto after 40 per cent.	13,000	
		37,000
Reserved capital		38,000
		£100,000

The Directors intend to confine their immediate operations to the erection of Model Establishments, to deodorise the refuse of one or more towns already selected, to apply the proceeds to the purposes of Agriculture, and thus practically to illustrate the many and great advantages gained by this new process.

With these views, an issue of 25,000 Shares is considered amply sufficient. The operations of the Company are intended to be—

1st. The granting of Licences to towns for the use of the invention at a moderate royalty.

2d. The supply of the deodorising and disinfecting powder for domestic use, and for application to manure heaps, cesspools, and liquid manure tanks; as also to public institutions, barracks, hospitals, &c.

3d. The supply of patent animal and vegetable charcoal for manure.

Assuming the royalty chargeable by this Company to be at the rate of 6*d.* per head of the population, the following Table will show the result (in round numbers) of the application to several towns in England, both as regards the sum to be received by this Company for royalty, and also the profit to the town working under a licence.

Name of the Town.	Population.	Annual Royalty payable to the Company, at 6*d.* per head.	Estimated gross profits, calculated upon the basis of 5000 tons *only* for every 100,000 inhabitants, at a profit of *only* 2*l.* 10*s.* per ton, and exclusive of the supernatant water.*
Manchester	316,000	£7,900	£39,000
Bristol	137,000	3,400	17,000
Hull	84,000	2,100	9,400
Brighton ...	70,000	1,700	7,500
Nottingham	57,000	1,400	6,800
Chester	27,000	690	3,300
Tamworth...	8,000	200	1,000
Chatham ...	40,000	1,000	5,000

It will be seen, therefore, that there are several sources of revenue to the Company. First, the royalty payable by towns—and the application of the invention to only a limited number must produce a large annual income Secondly, the sale, through a licensee or otherwise, of materials in a form applicable for use by private individuals for deodorising and disinfecting the contents of drains, cesspools, manure tanks, &c., as also the profit to be derived from the Patent Charcoal.

The composition will be sold at a price comparatively much less than that of any known disinfecting and deodorising agent, and considerable profits must arise from this branch of the undertaking.

Applications for shares (in the annexed form) to be addressed to the Directors, at the Offices of the Company, or to the Brokers.

FORM OF APPLICATION FOR SHARES.

TO THE DIRECTORS OF THE SEWAGE DEODORIZING AND PATENT MANURE COMPANY.

GENTLEMEN, 37, *Charing Cross, London.*

I request that you will allot me Shares of 1*l.* each in the above-named Company, and I undertake to accept the same, or such less number as you may allot to me, to sign the Deed of Settlement to the Company, and pay the sum of 1*l.* per Share when required.

Dated this day of 1854.

Name in full .....
Profession or Business .....
Residence in full .....
Reference .....

* Several eminent authorities, however, estimate the profit at the rate of 10*s.* per head of the population; this would, of course, give a much larger result than that stated in this table.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Ceprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CABNE, 10, Mark Lane, London.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.
The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturist's London Agent, 1A, Bishopsgate Street Within.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general, to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

PRIZE SWEDE SEED.

SUTTON AND SONS have a fine stock of Seeds of the best kinds of Swedes, Mangold Wurzel, &c., similar to those they supplied last season, the produce of which gained prizes at all the principal root shows throughout the kingdom.

At the Annual Root Show, held at Basingstoke, Hants, on December 21, 1853, at which 16 prizes were awarded for root crops, 13 were gained with the produce of our seeds; and at the Reading Show, on the 1st of the same month, every prize was awarded to roots grown from our seeds.—A Priced List may be had, post free.—Address,
SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S IMPROVED SWEDE TURNIP.—*The Stock of this excellent Swede has been grown for us this season by R. H. Watson, Esq., Dorsley, near Totnes. It is a most hardy and valuable variety. Price 1s. 6d. per lb. For further particulars and testimonials of its excellence see* "FARMING PRICE CURRENT," to be procured from
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

AGRICULTURAL INSTRUCTION.—A Farmer has some accommodation for a Pupil or two who may require instruction in Practical Agriculture, according to the best modern system, combined with economy. Pupils would have an opportunity of seeing the latest improved implements in use, a new and economical system of Irrigation carried out, and also the extensive use of the chief Artificial Manures applied to Corn, Root, and Grass crops, in addition to the ordinary routine of farming operations. References will be given and required. Terms 100*l.* a year; if a horse is kept, 25*l.* extra.—Fuller particulars may be obtained on application to R. VALLENTINE, Leighton Buzzard, Bedfordshire.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
LECTURES AND GENERAL MEETING.

Open to the admission of all members of the Society.

WEDNESDAY, May 10, at Twelve o'clock, Professor WAY'S Lecture: "On the Progress made in the Manufacture of Artificial Manures."

WEDNESDAY, May 17, at Twelve o'clock, Professor SIMONDS' Lecture: "On the particular indications of Age in Animals, as furnished by the structure of the Teeth and the general developments of growth in Cattle, Sheep, and Pigs."

MONDAY, May 22, at Twelve o'clock, GENERAL MEETING of the Society.

WEDNESDAY, May 24, at Twelve o'clock, Professor SIMONDS' Lecture, continued and concluded.

WEDNESDAY, May 31, at Twelve o'clock, Professor WAY'S Lecture: "On the nature and use of Peat Charcoal, and other deodorising substances, in reference to Agriculture."

At the Society's House, No. 12, Hanover Square.
By order of the Council, JAMES HUDSON, Secretary.
London, May 3, 1854.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

THE THIRD CHELTENHAM SUMMER POULTRY SHOW will take place at that magnificent establishment PITTVILLE SPA, on the 14th and 15th of June. For Prize Lists and full particulars enclose a stamped directed envelope to JESSOP BROTHERS, Secretaries.

The Agricultural Gazette.

SATURDAY, MAY 6, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 10 { Agricultural Society of England—Lecture by Professor Way.
THURSDAY, — 11—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 17—Agricultural Society of England.
THURSDAY, — 18—Agricultural Imp. Society of Ireland.

WE need not direct the attention of our readers to THE BALANCE SHEET in another page; for a *bonâ fide* article of that kind is rare enough always to excite sufficient curiosity. We have obtained permission to publish it, and do so, not with the view of urging any preconceived opinions, or drawing any partisan inference, but simply for the purpose of enforcing whatever truth it may, under the circumstances out of which it has arisen, be capable of teaching.

The profits of the farm were 150*l.* 11*s.* 9*d.* in 1852, and 167*l.* 4*s.* 3*d.* in 1853. Those of this year amount to 413*l.* 16*s.*; and that this is the result of agricultural prices rather than of agricultural produce, no one can doubt. That it is not wholly a question of price, however, is plain from the following figures, which state the produce and sales of the past three years, from which it will be seen how the quantity of stock kept, and the sales of mutton and other produce on the credit side of the sheep account, have increased year by year during the past three years, owing to the increased weight of the root crops, and the immensely increased produce of the Grass lands, under the improved treatment they have latterly experienced.

Year.	Wheat Crop. Acres.	Bushels.	Price per Bushel.	Produce.	Barley. Acres.	Bushels.	Price per Bushel.	Produce.	Sheep. Number of Stock.	Produce.	Cattle. Number of Stock.	Produce.

The farm consists of 164 acres of arable land and 93 acres of pasture.

THERE can be no more important subject for the consideration of the farmer than that which last Monday occupied the attention of the Central

Farmers' Club. Mr. Baker, of Writtle, read a very instructive paper at the monthly meeting of the club on that day, upon The Blights and Diseases of Plants, in which, without pretending to detail the connection, throughout its many steps, between the two, he pointed out the ordinary causes of the diseases termed blights, and the remedies, so far as they are known. This was, of course, for the most part, done in very general terms; and this, indeed, excepting a few particular cases, is the only way in which the subject can, as yet, be approached.

It seems a very unsatisfactory and insufficient thing, however true it may be, to say that the health of a plant depends simply upon its having food in the right quantity and of the right kind, administered to it under suitable conditions as to heat, light, and moisture; but this, the opening remark of Mr. Baker's paper, led, in his hands, to the practical discussion of the methods adopted by cultivators for insuring this supply of food for plants: and atmospheric causes—as influenced, if not in their force, at least in the scope given for their exercise, by thin sowing, by early sowing, and by the removal of hedgerows—were referred to; and those more direct influences which, by the cultivation of the soil, we bring to bear upon the plant—the use of mineral manures, as marl and chalk and lime—the application of farm manure to green crops instead of grain—the adoption of a proper rotation of cropping, all received attention.

It is to these general methods of insuring vegetable health, after all, that farmers direct their attention with the greatest reason to expect success. We confess to greater hopefulness on the ground of good drainage and good tillage, and good management as to the timing and succession of our crops, than to the absence of Berberry bushes, for exemption from mildew. So, no doubt, will the many speakers last Monday, who, nevertheless, insisted most confidently on the Berberry as being often the cause of mildew.

Besides mildew, which is less directly under the control of the cultivator, and rust also beyond his reach, smut and pepper-brand were referred to as preventible. The former attack the plant from without, their germs attaching themselves to the surface of the plant, in certain conditions produced by weather, luxuriance of growth, &c.; the latter are believed to attack the plant from within, their germs being introduced at a very early stage of the growth of the plant, ascending with the sap, and ultimately developing in the ear. They are accordingly preventible by the simple expedient of perfectly washing the seed, or subjecting it to some process of "pickling," by which the germs attaching to it may be destroyed. Instances were named which proved not only that diseased and infected grain contained, and would propagate, the malady—but that all parts of the diseased plant, the chaff, and straw, were similarly mischievous when applied as manure.

In reference to external vegetable parasites, it was remarked that while no such direct remedy or preventive was offered, as the attacks of the Uredo admitted of, yet that the judicious cultivator was less liable to their attacks than others; and that, while cure was impossible, the injury of the attack was diminished by an early cutting of the crop.

A considerable portion of Mr. Baker's paper was devoted to the discussion of the ravages of the Botrytis and other moulds affecting the Potato and other plants. The efficiency of sulphur as a perfect remedy for these attacks was referred to, and it was suggested, with, we fear, but little probability of truth, that gypsum and other sulphates might owe some of their power as manures to this quality of the sulphur present in their composition. The chairman stated, as *a fact*, which had held true for several years and over a considerable extent of land in his occupation, that lime and salt as a manure have proved a remedy for, or rather a preventive from, the Potato disease. On the lighter soils, on which alone the crop is grown, 40 bushels per acre of a mixture of lime and salt (in the proportion of 2 and 1 respectively) are applied broadcast before the sets are planted. The lime and salt are mixed several months before use, and no other manure is applied. The crop is healthy, and that this is due to the manure was proved in one plot of the field, where the application having been omitted the crop was diseased.

With the mention of this important matter of fact bearing on the subject, we must conclude this short notice of a very interesting discussion.

To exemplify the effects of accumulating sand and other more violent estuary obstructions upon the Outfalls of our Rivers, we shall next refer to the case of the Isle of Thanet. This is now scarcely a river peninsula; but, during the Roman ascendancy in Britain, it was a complete island, of a circular form; and the arm of the sea, then separating it from the mainland of Kent, was from 1½ to at least 4 miles in breadth. There is explicit testimony to prove that the direct route and accustomed passage to London by sea, so late as the middle of the fourth century, lay through this channel. In the time of Bede, however, it had begun to grow up; it was then but three furlongs wide, and so shallow as to be fordable in two places. It continued a passable strait for vessels no longer than the time of the Norman Conquest, when the inhabitants perceiving that the tide flowed without much vigour, began to erect banks to keep it entirely out; in which object they at length succeeded. After this junction of the Isle to Kent, the sea, unable to find a passage through the strait which it had gradually filled up, began to throw up immense quantities of beach on the eastern shore, producing Stonar, originally a distinct island, but quickly united by a causeway to the Isle of Thanet. Thus, there may be many cases in which, with all our skill, we fail to preserve an ancient channel against oceanic opponents.

The influences to which we are adverting, while causing great trouble in the maintenance of open outfalls for our rivers, create great breadths of new land, as well as form a defence for the old; but in the case of littoral sand-hills instead of beach, the engineering difficulties of preserving a river channel through an estuary landed up into a low marsh, and issuing it through a sea-made wall of driven sand which has occasioned the growing of that marsh, are very great indeed; and the sand hills have to be combatted in a way different to that brought into play against the shingle beach, but often with little better success. Let us look at the shores of Norfolk and Suffolk. While cliffs with their crown of villages have been undermined and swept away—several manors having been swallowed up piece by piece, and their sites, some fathoms deep, now forming part of the bed of the German Ocean—considerable lengths of the coast are defended by hills of sand, 50 or 60 feet high, blown up by the winds and bound together by the *Arundo arenaria* and similar plants. A rampart of heavy materials is first thrown up to an unusual altitude by some extraordinary tide, attended with a violent gale; subsequent tides extend the base, and heap up lighter substances upon its summit, while sand is blown from the beach and fills the interstices. The *Arundo* and other marine plants by degrees obtain a footing; creep along the ridge, give solidity to the mass, and in some places cause a matted covering of turf: meanwhile, another mound is forming externally, and by the like process rises and gives protection to the first. After a while, the areas inclosed by these concentric natural embankments become pasturage: the marine plants are succeeded by a better species of herbage, the quality of which improves in each successive area, as step by step we approach from the latest to the earliest formed, at the base of the cliff. Becoming sufficiently firm, in many places, to support buildings, they are sometimes occupied by numerous dwellings, where it is still within recollection that the sea flowed. At a remote period, the river Alde entered the sea at Aldborough; but the formation of a "ness," in the manner described, has effectually barred its mouth, and transferred it to a point no less then *ten miles* to the south-west; where, being reinforced by the waters of a second river, it flows to sea in a line nearly parallel with the coast. A few miles south of Lowestoft, one of those natural barriers has been stretched across an ancient inlet of the sea, completely shutting out the tides from a low valley, now partly occupied by a small fresh-water lake. The drainage water of this valley is discharged by means of a sluice and tunnel carried under the shingle bank.

A more important case is that of Yarmouth haven. The area of drainage delivering at this point by the rivers Yare, Waveney, and Bure, amounts to about 1500 square miles—including a large part of Norfolk, with a portion of Suffolk. These rivers unwater 10 different valleys, and flow through narrow marshy flats, comprising about 150 square miles, or 100,000 acres—all which originally formed an arm or inlet of the sea. The streams in their winding courses frequently expand from their general width, of 100 or 150 feet, into small lakes—locally termed "broads"—of which there are more than sixty, of a depth of from 15 to 30 feet, and an extent varying from one to 1200 acres. The estuary (or ancient Garienis) has been closed by a natural barrier formed directly across its mouth; and on this the seaport of Yarmouth now stands. This has caused the ancient sea inlet to become an inland valley, and the rivers, now subject to only a slight influx of the tide, to be contracted into small dimensions; their formerly expanded beds to grow up with peaty and alluvial low grounds, now drained by machinery; and the remaining estuary waters (now named Lake Lothing) to struggle for exit by a channel diverted *four miles* round the narrow tongue of land on which Yarmouth is situated. This ground was formed by the accumulation of heavy materials, rolled by the action of the sea; by the deposit of oozy sediment from muddy waters; by the growth of "denes," or the external covering of sand from the operations of the winds; and also by the rise and decay of vegetable substances. Had it not been for the action of the tidal currents, which by their strength and velocity preserve a deep channel (locally called the "Roads"), parallel with the shore, the deposits would have entirely debarred the river water of all means of egress. From the time of Edward III., when the sea choked up the ancient northern channel, there has been a constant struggle between man and the ocean for the sake of navigation and drainage. In the course of the first two centuries, *seven* new havens in different situations were successively constructed at average intervals of about 30 years. Between the middle of the 16th and 17th centuries, after *five* successive havens had been formed and abandoned, above 70,000*l.* were expended in others. There is a constant effort on the part of Nature to stretch the barrier, already several miles long, completely across the estuary; and this is counteracted alone by artificial means—by the application of the back-water, and the employment of a forest of timber in fencing the shores. During the last 490 years, the barrier has *actually closed up eight times*, having cost in the same period about *a million and a half of money* to keep open a passage for shipping, and preserve a sufficient channel for the discharge of the rivers. The restraint upon the inflow of the tides is now such that the water, at high tide, is from one to three feet lower on the inland than on the sea side of Yarmouth, though only separated by the natural bank which is not half-a-mile across. The water, however, is very pure, so that the difficulty of sedimentary deposition is not added to the other accumulations, as in some rivers. As it is, the Yare and its sister streams resemble sluice-locked canals rather than free rivers; and a most expensive artificial drainage of their low-land district is thus rendered necessary, in addition to the burden of maintaining heavy mounds against the sea, at points where the natural barrier of "denes" or sand banks present intermitting gaps along the shore. *I. A. C.*

AGRICULTURAL METEOROLOGY.

(*Concluded from page* 275.)

There are several other topics arising out of the application of the rotatory theory, which I should be too glad to bring before your readers; but they are not immediately connected with this particular storm of the 25th-26th August last, and I feel that I have already encroached most unduly on your limits. There is, however, one objection that claims a few words from me, viz., that I have exaggerated the effect which *valleys* have upon the course of a rotatory storm as it approaches *terra firma*, be it insular or continental; and be that valley merely an indentation of the land, such as the Bristol Channel or the Solway Firth, or one of the narrow seas, such as the Irish Channel or the English Channel; for it is said, that, allowing the utmost width to such a valley, 500 or 600 miles, with mountains to bound it of the altitude of 3000 or 4000 feet, what are these in proportion to a rotatory column of atmosphere covering an area of 20 or 30 degrees of longitude, and having a height of 30 or 40 miles, be the same more or less? What resistance can so slight an obstacle present to the direction taken by such a mighty mass? I have endeavoured to state this objection fairly, in the hope that some of the kind friends, who at different times have assisted me with their valuable suggestions, may aid me in elucidating the connection between the resistance of the earth and the pressure of the atmosphere.

It would be interesting also to trace the connection between this great law of nature and *geology, the foster-mother of agriculture*. It is a fact well established, that *coral* is found only in seas of tranquil waters and of a high temperature in modern days, analogous to which is the *chalk formation* of a bygone era. To pursue the parallel of detail would lead me into a fresh and inadmissible digression; but a perusal of Sir Charles Lyell's Chapters on Coral Formations, in his "Principles of Geology," forced upon my conviction the intimate relation between these submarine wonders of creation and the currents of the great deep, which owe their origin to the recurrence of the *storm waves* of Sir William Reid.

In conclusion, I have to offer my best acknowledgments to those gentlemen, whether they be private individuals or the official representatives of public bodies, who, on this present as well as on several other previous occasions, have so obligingly attended to my applications for information, and whose ready courtesy has so frequently lightened the trouble and expense necessarily attendant on my inquiries into the extent and nature of this law of storms. *F. P. B. M., Oxford and Cambridge Club, London.*

LEDGER AND BALANCE SHEET FOR 1853-4 OF A SOUTH HANTS FARM.

[We have been favoured with the following "true copy" of the past year's experience, as recorded in the account books of a South Hants farmer.]

COPY OF LEDGER.

1853.—*Dr.* Wheat.

Observations.—The above is taken from the accounts in the ledger. The 40 quarters of Wheat in hand are valued at 80*s.* per quarter; this is too high; it should be threshed out immediately and sold, or there may be a considerable loss on it. The Mangold Wurzel and Swedes are given to the cattle and sheep, and these

should be debited with their value; but as this is not done, their value must be sought for in the profits of the live stock. The apparent loss on the horses is owing to their labour not being charged on the various crops; so that this loss is to be found in the profits of the crops on which horse labour was employed.

We append the following statement of stock on hand at the beginning and end of the year, and of the labour connected with the several accounts:—

	Stock—1853. Lady-day.	Stock—1854. Lady-day.	Labour.
Wheat	£383 0 0	£283 15 0	£80 5 1
Barley	14 10 0	18 0 0	27 14 10
Clover	80 0 0	107 0 0	44 15 2
Beans	6 8 0	7 0 0	11 19 10
Carrots	10 0 0	10 0 0	3 7 1
Mangold Wurzel	70 0 0	70 0 0	28 8 8
Swedes	10 10 0	10 18 0	59 7 5
Potatoes	2 8 0	3 12 0	5 4 4
Cattle	444 0 0	431 0 0	53 18 2
Sheep	493 10 0	540 0 0	40 9 5
Horses	213 10 0	215 10 0	
Pigs	18 0 0	36 0 0	
Poultry	5 2 6	4 10 0	
General labour ...	...	...	53 3 0
Bailiff	...	...	80 0 0
	£1750 18 6	£1739 17 0	£488 13 0 or 38s. per acre over 257 acres.

The capital wanted on this farm is stated as follows:—

Horses	£220 0 0
Implements	228 0 0
Farming capital	1273 0 0
Dormant capital	413 16 0
	£2034 16 0

Or 8*l.* per acre on 257 acres.

We may mention that the profits exhibited by the accounts of 1852 and 1853 are 150*l.* 11*s.* 9*d.*, and 167*l.* 4*s.* 3*d.* respectively. *J. M.*

Home Correspondence.

False colouring of Cheese and Cider.—I have not observed that this subject has ever been noticed in the *Agricultural Gazette*, and yet it is well worth the consideration of the agricultural mind, and not less so of the gastronomic intelligence. Can any of your dairy correspondents prove that colouring matter is beneficial to cheese; that this improvement in quality is equal to the expense and trouble? Does it either hasten or retard the ripening process of cheese? Does it allow cheese to be kept longer? From the few inquiries I have made in a dairy country, I have found that those most agâte in cheese-making give an exactly contrary opinion. They say that giving this colour occasions considerable expense and trouble; they excuse themselves by saying that the factors would not buy their cheese without it; and I suppose the factors would say that the retail dealers would not look at it; and these latter, that their customers would not eat it. I am inclined to think that the consumer and retail dealer are the most answerable for the falsehood; for a lie it is, if beneficial or not, as long as the purchaser is allowed to believe that colour is a sign of richness. It only amounts to culpable ignorance in the consumer, while the dealer shores up this ignorance by lies; and the cheesemaker cannot entirely escape a charge of countenancing, through self-interest, a cowardly device. On the part of consumers, I affirm my own positive opinion that uncoloured cheese is by far preferable; pale cheese ripens better, and is of a better flavour than coloured. In these days of reform, when all falsities are scouted, why should this one linger, as an active lie, in the land of truth? Let the motto, "trust not to false appearances," descend to everyday life and practice, and be engraved on uncoloured cheese, and may the colour of shame be permanently fixed in the faces of those who use such uncolourable artifices. Are cheeses to be looked at or eaten? If I am told that I am to have the pleasure of eating a rich cheese, I would rather judge of it by my palate than my eyes. This reasoning, perhaps, may not seem quite so conclusive as regards cider, for Apples certainly have often a considerable colour, but their juice has not the same, or if so, not enough to give a deep tint to the cider. I have never seen the best natural cider of a dark colour, certain it is that colouring is very extensively used; and what is used would be very difficult of discovery, for it is a less delicate operation with cider than with cheese; the digestion of the former is of a more comprehensive nature; after a short internal disturbance it settles, and is corked submissively down till used, and we will not trace its consequences further. In colouring cheese a kind of vegetable paste, said to be imported from Spain, is, I believe, universally used; but in cider, though the colour may be often a vegetable dye and harmless, yet I should much doubt whether it be not often too mineral and unwholesome. Let the *Lancet* decide. Are we just then in blaming the Chinese, whom we are prepared to suspect of colouring their teas, while our own honest tradesmen do the same in a home production? I should be glad to see a confutation of these allegations in the *Agricultural Gazette*. I should be glad to be resolved (for it may be an erroneous idea) that all consumers of rich (looking) cheese, and strong bodied cider, are not, so far forth, fools; and the sellers of the same, to the same extent, knaves. *J. C. Leyhart, Lapstew.*

Manufacture versus *Farming.*—Agriculturists have been frequently regarded as lacking a guiding principle of action in their business, and have been often twitted with a want of adaptation in their farming to the land they cultivate, and of a due regard to the requirements of the markets they supply, their conduct in this respect being contrasted with that of the manufacturer, by which the superior intelligence of those engaged in commerce over those whose pursuits are agricultural are somewhat boastfully asserted. Most gladly do we accord to our merchant princes, and generally to those engaged in commercial and manufacturing transactions, the meed of praise which is manifestly due to their enterprise and skill; but ere they are contrasted with the farmers of England, in order to determine the respective merits of the parties, let an impartial view be taken of the relative positions which they occupy; for the merits of conquest must be computed not only by the trophies won, but also by the difficulties which first must be surmounted. The particular phase under which we propose at this time to exhibit the difference between manufacturing and farming, has more especial reference to the position of the tenant farmer, as contrasted with that of the manufacturer who is not the owner of the buildings he may occupy. The latter rents his premises, and provided he suffers no dilapidation to occur, he is free to use them in what manner, and for such purposes, as he thinks best; or not to use them at all, should he deem it desirable to remain inactive. His connexion with his landlord consists merely in payment of rent and keeping his hire in tenantable repair. For the raw material on which to expend his capital and exercise his skill—"The world is all before him where to choose." He is independent of all men, has an open market to go to, and may purchase as much or as little as he pleases of whatever commodity may suit his purpose, and having done so, work it up in the way most suitable to meet the existing markets. Should a period arrive when his business could be carried on only with positive loss, he may close his factory, and, "holding his own," may wait the return of more prosperous times. Not so, however, with the farmer. He hires not only his premises, but his raw material also—that material of a certain kind and in unvarying quantity. He must keep his factory going at whatever disadvantage, and cannot (to continue the simile) vary his mode of manufacture to meet the exigencies of the times, as his landlord has his signature to an agreement to work up the material in a specific manner, any breach of which is attended with heavy pains and penalties. The manufacturer or retail trader rents the place merely, the farmer both the place and the material, of business. In this view of the subject it will be at once apparent that whilst competition or demand excites, in the one case, to larger purchases of the material on which manufacturing skill is to be exercised, as well as to improved and more economical methods of accomplishing this result; in the other, it can only have the latter of these effects, for the waste and uncultivated tracts that yet remain form but a very fractional part of England's soil; indeed, the success of farmers has been so universally allowed to consist in the production of greater results from the same area (the same quantity of raw material), as to have become proverbial and given rise to the aphorism, that "He is a benefactor to his species who makes two blades of Grass to grow where but one grew before." I do not now discuss the merits of the question (which, perhaps, may form the subject of a separate article), but merely mention the fact as bearing upon the matter in hand, that the majority of tenant farmers are not allowed the free and full exercise of their agricultural skill to manage their land according to their best judgment or as changing circumstances might require, being bound to pursue a certain course and treat the soil in a specific manner. No wonder that a man reduced well nigh to the state of an automaton, loses the elastic spring and buoyant energy and quick perception of advantage displayed by his fellows in commercial life. There is fault in the system as well as in the man. Yet, as a parting word, surely in these days of chemical appliances and geological disclosures, farmers would be wise in emulating the anxiety displayed by rising manufacturers, to gain such scientific knowledge as, combined with practical experience, might point the road to victory, and evince that they subscribe to, and carry out, the worthy motto of their great society, "Practice with Science!" *Clathrus Celatus.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

Monthly Council, *May* 4.—Col. Challoner, Trustee, in the Chair. Thirty-five new Members were elected.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, submitted the report of the accounts, and the usual quarterly balance-sheets of the several branches of receipts and expenditure; the current cash-balance in the hands of the bankers being 1447*l.*

Country Meeting of 1855.—Mr. Raymond Barker, Mr. Fisher Hobbs, and Mr. Brandreth Gibbs, laid before the Council the Report of the Inspection Committee which had visited the localities proposed by the authorities of Carlisle for the meeting of next year. The Mayor of Carlisle, Hon. C. Howard, M.P., Mr. Marshall, M.P., and Mr. Irving, attended as a deputation from that city, and received the thanks of the Council for the local information they kindly supplied. The question of the final decision of the place of meeting was postponed until the ensuing monthly Council, when the deputation would be enabled to present a report on the railway facilities that would be afforded to the Society's exhibitors of live stock and implements at the meeting proposed to be held at Carlisle.

Country Meeting of 1858.—The district for the Country Meeting of this year being situate in the mid-eastern part, and that of next year in the northern part of England; that of 1856 north of London; and that of 1857 in the mid-southern part of England; the Council had that day, according to established custom, to determine the district for the Country Meeting of 1858. A deputation waited on the Council for the purpose of representing the agricultural claims of the county of Chester and of North-Wales, to be included in the new district about to be formed. This deputation included Visct. Combermere, Earl Grosvenor, Hon. H. Cholmondeley, Hon. Col. Douglas Pennant, M.P.; Sir Philip Egerton, Bart., M.P.; Sir Watkin Wynn, Bart., M.P.; Mr. Tollemache, M.P.; Mr. Cornwall Legh, M.P.; Col. Biddulph, M.P.; Major Pugh, M.P.; Mr. Egerton, M.P.; Mr. Meyrick, M.P.; Mr. West, M.P.; the Mayor of Chester, Mr. Humbeston, Mr. Roberts, Mr. George Chivas, Mr. John Churton, and Mr. H. Churton. They presented memorials from the landowners, magistrates, &c., in the counties of Anglesea, Caernarvon, Denbigh, and Flint; from the magistrates, landowners, agriculturists, &c., in the county of Chester; and from the Mayor, Aldermen, and burgesses of the city of Chester. The deputation having submitted these memorials, and explained at length the peculiar claims which the county of Chester and North Wales generally had upon the favourable consideration of the Royal Agricultural Society of England, on the motion of Sir John Shelley, Bart., M.P., a vote of the best thanks of the Council was offered to these noblemen and gentlemen for the warm interest they had expressed in the promotion of the objects of the Society, and the kind trouble they had taken in attending the Council on that occasion.—On the motion of Sir John Shelley, seconded by Mr. Raymond Barker, the Council then decided that the district for the country meeting of 1858 should consist of the whole of North Wales, including the counties of Chester, Stafford, and Salop.

Reduction of Expenditure.—Mr. Thompson, on the part of the Duke of Richmond, Sir John Shelley, Col. Challoner, and Mr. Fisher Hobbs, who, with himself, had presided over the meetings of the Reduction of Expenditure Committee, presented the final report of that committee; which being adopted by the Council, was referred to the several standing-committees of the Society, connected with the reductions proposed, in order that they might report the practical form in which such reductions could be carried into operation in the most satisfactory manner, without impairing the efficiency of the particular departments to which they respectively belong.

Prize Essays.—Mr. Pusey reported from the Journal Committee the following awards:—

I.—To Thomas George Bell, L.L.D., of Bellevue House, Gateshead, the Prize of Fifty Pounds for the best Report on the Farming of Durham.

II.—To John Coleman, of Deene, near Wansford, the Prize of Thirty Pounds for the best Account of Under-Drainage. The Judges commended the Essay in this class bearing the motto "Res facta."

III.—To James Buckman, Professor of Botany in the Royal Agricultural College, Cirencester, the Prize of Twenty Pounds, for the best Essay on Agricultural Weeds.

IV.—To Isaac Seaman, Veterinary Surgeon, Saffron Walden, the Prize of Ten Pounds, for the best Essay on Giddiness in Ewes at Lambing.

The author of the essay, "Woodman spare that Tree," was requested to communicate his present address to the secretary of the Society.—Mr. Pusey also communicated suggestions for the subjects of the Essay Prizes for next year, to be determined at the ensuing monthly meeting.

Analytical Chemistry.—Sir John Johnstone, Bart., M.P., presented the report of the chemical committee, which was adopted. Mr. Thompson gave an interesting detail on the value of this privilege of chemical analysis to the members of the Society, and the reduced rates at which results were furnished to them for their guidance in the purchase of manures.—Mr. Fisher Hobbs hoped that the committee would suggest some uniform system for the enunciation of these results, when different chemists stated the analysis of the same substance, in order that a comparison might be instituted and a practical inference deduced. At present he thought theoretical considerations led chemists too much away from the simple statement of fact in their results of analysis, and rendered their analyses intelligible only to scientific men, the simple element the base into which that element entered, or th resulting salt, being furnished in many cases as equivalent exponents, while the general terms, organic or inorganic matter, &c., were considered sufficiently definite in others.—Mr. Paine stated his large outlay annually in the purchase of manures, and the corresponding large saving that he constantly effected by the assurance he gained on the one hand, or the warning on the other, from Professor Way's analyses of samples before purchased.

Lincoln Meeting.—The Hon. Leslie Melville presented the report of the general Lincoln Committee, which was confirmed. The Council decided on the erection of a pavilion at the Lincoln Meeting, to accommodate 800 persons at dinner.

House-List.—The Council agreed to their house-list for the general meeting on the 22d inst., agreeably with the terms of the bye-laws.

Steward of Implements.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Hamond, Chandos Wren Hoskyns, Esq., of Wroxhall Abbey, Warwickshire, was unanimously appointed the steward-elect of implements at the Lincoln Meeting; in succession, on the retirement by rotation, of Sir Matthew White Ridley, Bart., the senior steward of implements at the Gloucester Meeting.

Communications were received from Viscount Palmerston, on the measures taken, on the representation of the Society, to arrest the progress of rabies among dogs; and on the analysis of sewerage matter: and from the Earl of Clarendon, on the occurrence of deposits of alkaline and earthy nitrates in Mexico. The Council ordered their best thanks for these communications. Adjourned to May 10th.

Notices of Books.

Farming for the Million. By George Glenny. Eyre and Williams, Bouverie Street.

"THE MILLION" are, of course, cottagers. The chapter on farm implements refers to churns, pig troughs, wheelbarrows, pumps, and self-adjusting scythes; and one of its ten pages is occupied with the drawing of a rick "settle," which would hold all the corn grown on twenty such farms as the book is, we presume, intended for.

We have a chapter on draining, too, consisting of four pages, and a good portion of this space is occupied with the account of the author's own experience, which appears to have extended to the laying of drains which, if they did not lead the water directly out of the plot of land, conveyed it at any rate to a hole, a deepish pit or pond, *in* it, whence it could be pumped at intervals into a surface channel, which should carry it away; but on this we must quote the author's own words:—"Fanciful drainage is all nonsense."

The remaining 40 chapters of the work we need not characterise; it may suffice to say that they consist in the whole of 74 small pages.

Poultry.

ANNA. We consider the ducklings sufficiently old to have access to a running stream or pond, and confidently advise that the old one be placed in a coop on dry turf, a little distance from the water, and be there confined for a day or two, after which we should not hesitate to give her liberty during a part of the day, lengthening by degrees her leave of absence. We find no fault whatever with the manner of feeding, but suggest that the ducklings be given plenty of Barley meal, and a little whole corn, the latter to be gradually increased. We consider this plan will prove not only a preventive but even a cure, should the disease have already appeared. With regard to the proper pronunciation of "Cochin," we advise you to pronounce it neither "cotchin," "cōshin," or "cōsheen," but simply as it is spelt, "cō-chin."

Miscellaneous.

Certain Improvements in the Treatment of Corn and other Grains, and more especially in all that concerns Washing, Drying, Grinding, Curing, and Preserving them; by N. A. E. Millon and L. Mouren, of Algiers. Patent granted March 12, 1853. (No. 625.)—The object of this invention is to expel from grain the moisture absorbed during the washing process, and also a portion of that naturally contained in it, so as to reduce the amount present to a uniform per centage. This is accomplished by the use of a hot-air stove in conjunction with that of the centrifugal machine, by which means the grain is prepared in a manner that renders it better adapted for the production of flour than when treated in the ordinary manner. *Mechanics' Magazine.*

Calendar of Operations.

APRIL.

WEST SUSSEX, *May* 2.—We have been waiting rather anxiously for an April shower, but have hardly had one, and though among the hills they seem to have now and then had a few drops, here on the flat coast land we have had none to lay the dust till yesterday, when we had the finest fall that we could have wished; it came so gradually, and the air was so mild, that every thing seemed really to enjoy it. Many were beginning to fear that the cattle would be badly off, as the winter food is all but gone. Most of the couples have got upon the young Clovers. Now we are thinking ourselves all right. We not only wanted rain for the growing crops, but also for the fallow lands, some of them have got very hard, and we have had lumps to defy the clod-crusher, which is not often the case; but the worst of this is past. Barley has come up very irregularly; in parts where the moisture could rise from below, it has done pretty well, but in other parts, close to this, where the moisture could not get up through the hard tenacious subsoil, the Barley that has been sown for a month still lies unvegetated, and as hard as when it was put in; is not this a lesson for us to break the bottom up a little better and deeper? Oats that were sown earlier and upon land that was ploughed in the winter, so as to have the action of the frost upon it, have not done so badly, as the well pulverised top has prevented the too sudden action of the drought. Wheat has done and is doing well, retaining a very good colour. Peas and Beans are healthy, but, as might be expected, have not grown fast. The markets for lean stock have been dull, and little has been sold lately, but now we may expect a more lively demand. But all fat stock are a ready sale, at good prices; we have not had many fat Down lambs in the market yet, but what have been have sold well, at from 30*s.* to 32*s.*, or about 10*d.* per pound. There are few of the horned breed offered here, they being mostly sent direct to London. We shall be employed getting in Mangold Wurzel as fast as possible, which ought to have been in before this, but the land has required so much more labour to break it down, and in fact hardly any amount was sufficient to pulverise it properly till the rain came. But in light working land a good deal has been done in the way of clearing, and work generally may be said to be well advanced. *G. S.*

Notices to Correspondents.

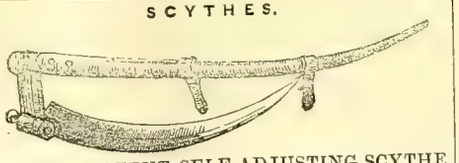
GEOLOGICAL SOCIETY: *R T C.* You must make known your wishes to any friends you may have among its members; and they may introduce you.

SALT: *W T B.* We would flag the Wheat with the sickle or scythe, and sow about 1 cwt. per acre of fine salt, in wet weather, on it. And if you have an opportunity of a rainy day a week afterwards, sow another cwt. then.

SMALL FARMS. Blacker's "Essay on Small Farms" will probably assist you. "Agricultural Economy the Antidote to Agricultural Distress" is another work bearing on the subject.

WHEAT, BARLEY, OATS, INDIAN CORN: *Sub.* See "Johnston's Agricultural Chemistry." We will extract the information next week.

SCYTHES.



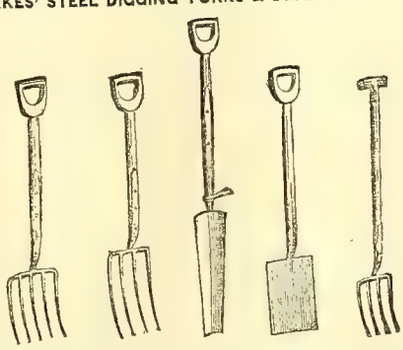
BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.

"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.

To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

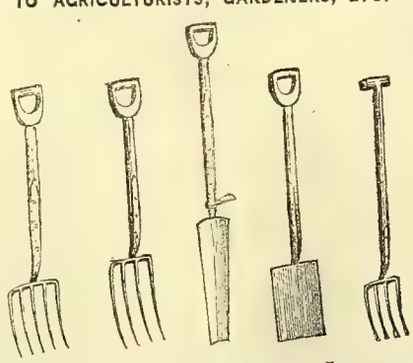
ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

TO AGRICULTURISTS, GARDENERS, ETC.



BENNETT AND NAYLOR, GENERAL IRONMONGERS, and FACTORS, Sole West End Agent for PARKES', late WINTON PARKES' CELEBRATED STEEL DIGGING FORKS and TOOLS. Also for the only efficient Stove, with or without a flue, suited particularly for Conservatories and Greenhouses, Patronised by her Majesty. Price 12*s.*, and upwards, at the Great Western General Ironmongery Warehouse, 255, Oxford Street, between Park Street and North Audley Street, Established for the sale of all descriptions of Ironmongery at Wholesale Prices. Sheet, Hoop, Rod, and Bolt Iron; Locksmiths and Bell-hangers. Patent Fuel, to be used with the Stove, 2*s.* 3*d.* per bushel.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.

Extracts of Testimonials and references to persons using it.

"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*

"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*

"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*

"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bodicott, Oxon.*

"Has been working every day."—*T. Cardus, Barwell, Surrey.*

"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*

"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*

"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"

"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*

"Been digging all the week; the *champion* of all implements in England; should be very sorry to be deprived of it."—*Thomas Lawrence, Thurlaston, Dunchurch.*

"Well satisfied last year. Turnips were a superior crop."—*O. Brickwell, Overthorpe, Northamptonshire.*

"Well satisfied last year. Turnips were a superior crop."—

Price 24*l.* 10*s.*, the general purpose size; and 27*l.* 10*s.* large size, Cash; at the Works, Banbury.

PURVEYORS OF LIVE BIRDS BY SPECIAL APPOINTMENT TO HER MAJESTY AND H.R.H. PRINCE ALBERT.

BAKER'S POULTRY RESTORATIVE.—Ten years' experience of its success, in all Diseases of Poultry, justifies them in recommending it with the greatest confidence; one among its many advantages being the facility with which (in its liquid form) it is administered, obviating the troublesome necessity of handling the birds, and speedily imparting such vigour and high condition that can be acquired by no other means. Price 2*s.* 6*d.*, either in Liquid or in Pills, with directions for Roup, &c. By all Chemists.

BAKER'S REGISTERED FOUNTAINS, for Poultry, Pheasants, and Pigeons, supplant all others. Four quarts, 6*s.* 6*d.*; nine quarts, 8*s.* 6*d.*—Messrs. BAKER, City; and the Pheasantry, Beaufort Street, Chelsea.

IMPROVED WATERPROOF FLEXIBLE HOSE FOR WATERING GARDENS, AND AGRICULTURAL USES generally, at E. SPENCER & CO.'s, GENERAL WATERPROOFERS, 116, Fenchurch Street, opposite Mark Lane, London.

HOSE PIPING.—GREAT REDUCTION IN PRICE.
WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.
JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road, London.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

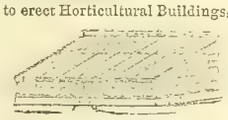
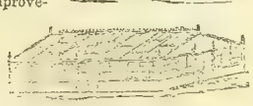
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.





The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

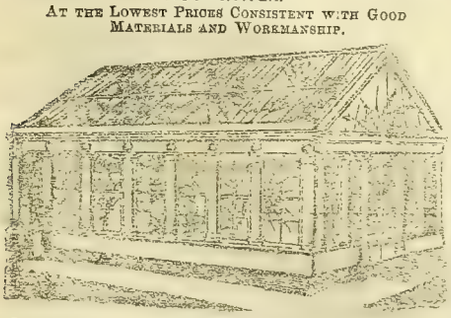
The splendid collections of Stove and Greenhouse Plants, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S

ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

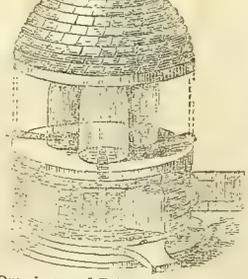
GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

BEES AND HIVES.

MARRIOTT'S HUMANE COTTAGE BEE-HIVE, for taking honey without killing the Bees, is the best for practical use. Newly illustrated Catalogue forwarded for penny stamp.—MARRIOTT, Apiarian, Surrey Zoological Gardens; City Warehouse, 24, Fish Street Hill, London Bridge.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

HALL'S GARDEN NETTING, the best protection against FROST, STORMS, OR SCORCHING HEAT.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

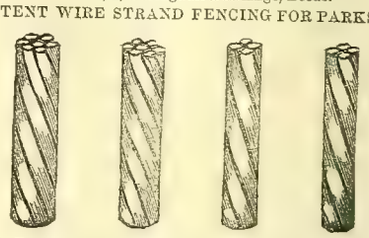
	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	... 7*d.* per yd.	5*d.* per yd.
2-inch " strong "	... 9 "	6½ "
2-inch " extra strong "	... 12 "	9 "
1⅝-inch " light "	... 8 "	6 "
1⅝-inch " strong "	... 10 "	8 "
1⅝-inch " extra strong "	... 14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

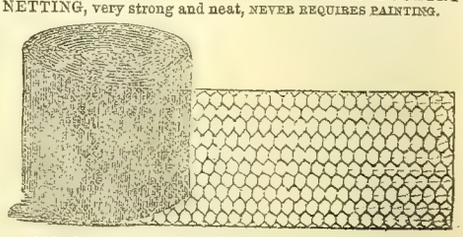
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

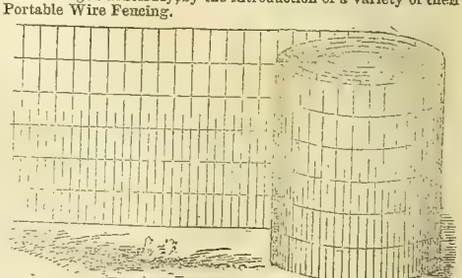
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

AGRICULTURAL AND POULTRY FENCING, MANUFACTURED BY PATENT MACHINERY.

The great increase in the number and quality of POULTRY in the United Kingdom within the last few years has created a demand for an efficient Poultry Fence, which has called into existence every possible contrivance and adaptation of the Wire and Cord Netting, all of which have more or less proved failures.

B. GREENING & CO. have succeeded in supplying this acknowledged deficiency, by the introduction of a variety of their Portable Wire Fencing.



No. 11. PATENT DOUBLE FENCING (Proof against Poultry and Chickens).

This Fencing (which they manufacture by machinery, patented last year) is light, portable, and elegant in appearance, yet stronger and more durable than any Fence before the public. It requires few standards, and is fixed with the utmost facility by a labourer or gardener.

The following are the principal other varieties:—CATTLE FENCING, SHEEP AND LAMB FENCE, HARE AND RABBIT PROOF FENCING, ORNAMENTAL FENCING FOR GARDENS, TRAINERS FOR PEAS, GARDEN BORDERING, EXPORT FENCING, &c. &c., manufactured by Patent Machinery by BENJAMIN GREENING & CO.

1 and 3, CHURCH GATES, and 2, CATEATON STREET, MANCHESTER,

From whom every information, together with Prospectuses and Engraved Sheets of Patterns may be obtained gratis.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cliveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Bridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom, as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The Machine is made to cut the breadths of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

Further particulars, with prices, may be had on application.

(Fig. 1.) (Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws 30 feet high	...	£4 10
No. 2 „ 15 „ „ 45 „	...	5 10
No. 3 „ 28 „ „ 45 „	...	6 18

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws 25 feet high	...	£2 15
No. 13 „ 12 „ „ 30 „	...	3 5
No. 11 „ 16 „ „ 40 „	...	4 0
No. 12 „ 24 „ „ 45 „	...	5 0
No. 14 „ 30 „ „ 45 „	...	5 18

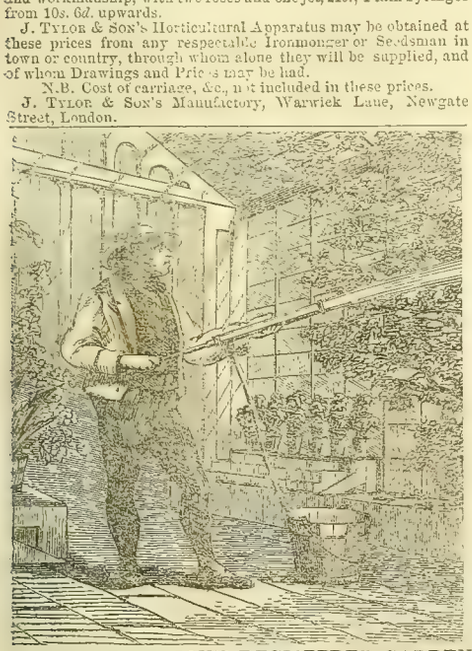
A large assortment of every description of Garden Syringes Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21s.; Plain Syringes from 10s. 6d. upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25s. each. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. This price does not include carriage, package, or expenses of delivery in the country.

GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS, for Conservatories, Public Buildings, Manufactories, Skylights, &c.

JAMES PHILLIPS AND CO., Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

Extract from *Garden rs' Chronicle*, April 21, 1854.

"The garden also supplied some Neapolitan Cabbage Lettuces, a portion of which had been grown under bell-glasses, which differ from the French cloche in having a ventilator at the top, in the shape of a neck or chimney, which can be left open or kept close as may be desired, by covering it over or not with another small bell glass, made for the purpose. The result of this trial has been very satisfactory."

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HETLEY AND CO. are supplying 16-oz. Sheet Glass of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

Sizes.—Inches.	Inches.	Per foot.	Per 100 feet

21 oz. „ 3½d. to 5d. „ „ „
26 oz. „ 3½d. to 7½d. „ „ „

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in sheet or Rough Plate Glass.

Propagating Glasses, Beehive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in Glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY & Co., 35, Soho Square, London.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

CHAFF-CUTTERS, of the best workmanship, 25s.; Two-Knifed Chaff Engines, from 63s.; Mills for Bruising Oats and Beans, from 45s.

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

RICHMOND AND CHANDLER'S No. 1 CORN CRUSHER (Price 5l. 5s.) was first introduced a few years ago, as a decided improvement upon others theretofore made. Subsequent time and experience have served to render it more perfect, and to greatly extend the pre-eminent patronage of members of the Royal Agricultural Society, and distinguished scientific authorities throughout the world.—Address, RICHMOND & CHANDLER, Implement Works, Salford, Manchester; and 32, South John St., Liverpool. Export orders completed on the shortest notice.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

THOMAS B. LAWRENCE AND CO., ZINC MERCHANTS and MANUFACTURERS, No. 10, York Place, near the Orphan Asylum, Lambeth. Rain Pipes, 3-inch, 4½d. per foot; Eaves Gutters, 4-inch, 4d. per foot; other sizes in proportion; Perforated Zinc, 4l. per foot; Sheet Zinc, 33s. per cwt.; Plumbic Zinc, 42s. per cwt.; Galvanised Iron, Corrugated or Plain. Lawrence's Fumi Porte; Patent Smoke Vents; Garden Lights, Frames and Glasses. Lawrence's Roses and Watering Pots. Wardian Cases.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.

THE CHOLERA

PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts, 2s.; Pints, 1s.; Half-pints, 6d. Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton, Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1s. 1½d. per box.—Observe that "THOMAS PROUT" is on the Government stamp.

HOLLOWAY'S OINTMENT AND PILLS
WONDERFULLY EFFICACIOUS IN CURING BAD LEGS.—Extract of a letter from Mr. John Perkins, of Long Lawford, near Rugby, dated Feb. 11, 1854. "To Professor Holloway.—Sir: My wife suffered for four years with a frightfully ulcerated leg, accompanied by dropsical swellings, and profuse watery discharges. She consulted several medical men, and had recourse to a variety of remedies, but without deriving any benefit. At last she tried your Ointment and Pills, and after persevering with them for about six weeks, the wounds on her leg entirely healed, and she was thoroughly restored to health—a blessing quite unexpected to all her acquaintance."—Sold by all Druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

SEEDS TO IRELAND.—*Plymouth is admirably situated for supplying our sister country with some English Seeds. The Subscribers can refer to some of the leading families in Ireland, who have for many years obtained the whole of their supplies of Garden and Farm Seeds. Seeds delivered free to many of the Irish ports. See Price Current.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MORTON'S YELLOW GLOBE MANGOLD WURZEL, *saved by Thomas Bennett, Esq., Gloucester, from the Stock originally grown by J. C. Morton, Esq., the Editor of the Agricultural Gazette.*

Seed of this most excellent variety can now be obtained from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, who have purchased the whole of the Stock.

SUTTON'S EARLY SIX-WEEKS TURNIP, AND THE LINCOLNSHIRE RED GLOBE, *two of the largest and best Turnips for early sowing, to feed off previous to Wheat sowing*: Six-weeks, 1*s.* 4*d.* per pound; Lincolnshire Red, 1*s.* 6*d.*

A priced List of Swedes and other Turnips post free.—Address, JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

BEAUTIFUL NEW VARIEGATED-LEAVED PLANT, "APHELANDRA LEOPOLDI."

JAMES VEITCH, JUN., of the Exotic Nursery, Chelsea, begs to inform all collectors of plants with Striped and Variegated Foliage, that Mr. L. Van Houtte, of Ghent, has appointed him his agent in this country, for the sale of this fine and distinct Plant. The foliage is of a light glossy green colour, regularly and distinctly marked with white stripes, not fading or running with age. In addition to its lovely foliage, it has beautiful Flowers; thus rendering it a decided acquisition to every stove; indeed, no collection of variegated-foliaged plants will be complete without it.

J. V., jun., has fine Plants ready for delivery at 21*s.* each, with one over to the trade when three are taken.—Chelsea, May 6.

N.B.—A beautiful Plate will be sent, without charge, to persons taking three Plants.

DILLISTONE AND CO. beg to offer the following:—STRAWBERRY PLANTS.—Ten of the best kinds always on hand, 2*s.* 6*d.* to 3*s.* 6*d.* per 100.

HOLLYHOCKS saved from 20 of the best named kinds, and kept separate, 3*s.* per dozen; 20*s.* per 100.

BEDDING PLANTS.—Many thousands will be ready in May, 3*s.* to 6*s.* per dozen, or cheaper if 100 are taken.

ROSES.—Tea, Bourbon, and Hybrid Perpetuals, and new ones, on the Manetti stock.

HERBACEOUS PLANTS, fine and good, 20*s.* to 30*s.* per 100.

Orders above 20*s.* paid to London. Lists upon application, enclosing a stamp.—Nurseries, Sturmer, Halstead, Essex.

MAY'S PARAGON CABBAGE.

THE SUBSCRIBER, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28 lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ½ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to send out the following new plants:—

The Set, 42*s.*

The above twelve distinct Verbenas have been Bedded out and proved the second season; the raisers are Messrs. Banks, Stewart, and Fozard. For descriptions of the above New Plants see back numbers of this paper.—May 6.

STAR NURSERY, SLOUGH.

WILLIAM BRAGG begs to inform the Floral world that his Catalogue of DAHLIAS for 1854 is now ready, and can be had gratis on application. "The Beauty of Slough," which was figured in last month's "Florist," is now ready to send out. Likewise his choice new set of Nine VERBENAS, which has taken several First-class Certificates at the National and other Floricultural Societies. Also the new dark Horseshoe-leaved Geranium "Glory," which obtained a Certificate at the National, is now ready. This splendid variety will prove a great acquisition as a pot or bedding plant.

W. B. has still on hand a good Stock of Hollyhocks, Geraniums, Fancy Geraniums, Pansies, including his four new ones; several hundred dozens of Bedding Plants, Chrysanthemums, Verbenas, Fuchsias, Phloxes, Roses, &c. Choice Pink, Pansy and Hollyhock Seeds, in packets 2*s.* 6*d.* each, post free.

All Parcels carriage paid to London, and plants given to compensate for carriage.—May 6.

NOTICE.

THE ADMINISTRATORS of the late JOSEPH FAIRBAIRN, of Clapham, Nurseryman and Seedsman, beg most respectfully to call the attention of Noblemen, Gentlemen, Amateurs, and the Trade, to their varied and extensive Stock of STOVE and GREENHOUSE PLANTS, particularly to their Ericas, Azaleas, and Aphelexis, which are all now in high perfection; also their Shrubs and soft-wooded Plants for Parterre and Border Planting in every variety. They beg to return their grateful thanks for the patronage so long bestowed on the old established Firm of JAMES & JOSEPH FAIRBAIRN, and afterwards on JOSEPH FAIRBAIRN alone; and to state that all Orders will receive their prompt and best attention, and they are prepared to do Business on such liberal terms, for Cash, as they trust will insure a continuance of such patronage.

Clapham Nurseries, near London, May 6.

ROLLISSON'S UNIQUE.

JAMES JENNER begs to announce that he has a large Stock of the above GERANIUM now in bloom. Also large plants of Tom Thumb for vases, &c.

Priory Grove, South Lambeth.

PAGE AND CO.'S

CLAPHAM NURSERIES.

THE STOCK OF PLANTS OF THE LATE MR. JOSH. FAIRBAIRN.

MR. J. C. STEVENS is instructed by the Administrators to announce for Sale by Auction, on the Premises, on MONDAY, 22d; TUESDAY, 23d; and THURSDAY, 25th May, at 12 for 1 o'clock, without reserve, the first portion of the valuable Stock of Plants at the above Nurseries; it includes the Collection of Heaths, for which this establishment has been so long celebrated; fine specimens of Azaleas, Aphelexis, Epacris, and a general selection of Greenhouse Plants, all of which are cultivated in the best possible manner, and are in excellent health. They will be lotted to suit the Trade and private buyers.—May be viewed on Friday and Saturday before the Sale, and Catalogues had on the premises, and of Mr. J. C. STEVENS, 38, King Street, Covent Garden; if for the country, by enclosing four postage stamps.

STOCKWELL GREEN.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, on the Premises, Stockwell Nursery, Stockwell Green, on TUESDAY, May 16th, at 11 o'clock, by order of Mr. Tooley (leaving the premises), about 20,000 GREENHOUSE PLANTS, consisting of Geraniums, Fuchsias, Verbenas, Calceolarias, Heliotropes, Salvias, Petunias, &c.; also a strong useful Horse, Tumbril Cart, &c.—May be viewed three days prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BLACKHEATH.

MESSRS. PROTHEROE AND MORRIS beg to intimate that they have received instructions from Mr. W. P. Ayres, Nurseryman (removing to a distant part of the country), to submit to public competition by Auction, in the Lecture Hall, adjoining the Blackheath Station of the North Kent Railway, on TUESDAY, May 9, at 11 for 12 o'clock precisely, in consequence of the number of lots, the whole of his unrivalled collection of Specimen FANCY PELARGONIUMS, fit for exhibition; also Stove and Greenhouse Plants, Bedding Plants, &c.; together with many thousands of the choicest Pelargoniums just coming into bloom, Fuchsias, Chrysanthemums, Roses, &c.—May be viewed one day prior to the Sale; Catalogues may be obtained of the principal Seedsmen in London; of Mr. AYRES, and at the Lecture Hall, Blackheath; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, FLORISTS, & OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, May 11, at 12 o'clock, a first-rate collection of Carnations, Picotees, and Pinks. A fine assortment of Fuchsias, Verbenas, and Dahlias in dry roots; Geraniums, and other plants in bloom, with a variety of plants for bedding.—On view the morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO TULIP FANCIERS AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by Mr. Staines to sell by Auction, on the premises, Culley's Nursery, near the New Globe Tavern, Bow Road, Middlesex, on MONDAY, May 22d, at 2 o'clock, his superb collection of TULIPS, including about 400 varieties, and most of the choicest in cultivation, together with Seedlings of his own raising, not to be found in many other collections.—May be viewed three days prior to the Sale Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO TULIP FANCIERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Goldham to submit to public competition by Auction, on the premises, Hynder Cottage, Merton Lane, Mitcham, Surrey, on FRIDAY, May 26, at 1 o'clock, a portion of his costly and unrivalled collection of TULIPS. No comment on this magnificent Stock will be equal to an inspection of its striking beauties, for which an opportunity is now offered to the Amateur Florist, &c. New Flowers and Seedlings of Mr. Goldham's raising—the result of more than 30 years' successful cultivation and competition, and which, for the first time, are now offered.—May be viewed two days prior to the sale; Catalogues may be obtained, 1*s.* each (returnable to purchasers), on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO TULIP FANCIERS.

W. BRAGG will cause to be sold by Auction, about the 18th, or, at latest, the 25th of MAY, his choice and superb bed of 128 rows of TULIPS, including some scarce varieties. Further Notice will be given in this Paper and by Catalogues.—Star Nursery, Slough, May 6, 1854.

TO NURSERYMEN, FLORISTS, AND GARDENERS.

MESSRS. CRAWTER will Sell by Auction, at Garraway's Coffee House, Change Alley, Cornhill, London, on TUESDAY, May 23, at 1 o'clock precisely, without reserve, unless previously disposed of by private contract, the desirable Leasehold Estate, with possession, called PERCY CROSS NURSERY, in a commanding situation on the high road at Walham Green, Fulham, adjoining the mansion and grounds of Lord Ravensworth, comprising a convenient Residence, containing seven Rooms, Shop and appendages, Conservatory, Hothouses, Sheds, and other Buildings, with about 1 Acre of rich productive Nursery or Garden Ground.—May be viewed by application at the Premises, and particulars had 10 days before the Sale at Garraway's, the Inns in Fulham, and the surrounding neighbourhood; also of Messrs. Hanslip & Conworth, Solicitors, 12, Hatton Garden, and of Messrs. CRAWTER, Land-agents, Surveyors, &c., No. 5, Bedford Row, London, and Cobham, Surrey.

CHOICE AND VALUABLE COLLECTION OF TULIPS.

TO BE SOLD by Auction, without the least reserve, on the premises, Cooper's Lane, Leyton (near the Church) on FRIDAY, May 26th, at 1 o'clock, comprising among Bizarres Marcellus, Strong's King, Pompe Funebre, Everard, Apelles, Vivid, Sphynx, Willison's King, Norman's Royal Albert, Achilles, Sir E. Knatchbull, Sir George Whitmore, Alexander's Monarch, Emperor, Rembrandt, Charles Baron, Coftan, Charles Jeffrey, Kossuth, Paganini, Waterston's Midas, Grisewood's Grace Darling, Morning Star, Headley's King Richard. The Byblœmens comprise Pandora, Salvator Rosa, Rutley's Queen, Brown's Magnificent, Duke of Northumberland, Dixon's Democrat, Parmegiano, Byzantium, Nora Creina, Lord Bloomfield, Thalia, Louis XVI., Godet Parfait, Patty, Zuill's George Glenny, Flora, Father Gavazzi, Reid's Duke of Argyll, Thomas Maxwell, Lord J. Russell, Sir H. Smith, Wylie's Rob. Wylie, &c. Among the Roses are Rose Lac, Sans Egale, Camuse de Craix, Brulant Ecletant, Dixon's Arlette, Bion, Alexander's Gem, Jenny Lind, Jeffrey's Elizabeth, Maid of Honour, Village Maid, Flora M'Donald, Mary Lamb, Miss O'Neil, Mrs. Zuill, John Waterston, Munroe's Mount Hecla, &c.; also many new flowers only in this collection the property of Mr. James Alexander.—May be viewed two days prior to Sale; Catalogues had at the Mart; of Messrs. Dawe, Cottrell, and Benham, Seedsmen, Moorgate Street; White Swan, West Ham; on the premises; and of Mr. Henry Alexander, Auctioneer, Shackleweh.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MAY 6, 1854.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—The Exhibitions of the above Society will be held as usual at the ROYAL SURREY ZOOLOGICAL GARDENS, in JUNE, JULY, and SEPTEMBER.—Particulars may be had of the Secretary, J. T. NEVILLE, Ebenezer House, Peckham.—May 13.

WEST KENT SECOND ANNUAL POULTRY AND FLOWER EXHIBITION, Under most distinguished Patronage, will take place on TUESDAY and WEDNESDAY, the 20th and 21st of June next, in the Market Field, Farningham.

Prizes will be awarded for Poultry, Pigeons, and Rabbits. Stove, Greenhouse, and Herbaceous Plants, Fruits, Vegetables, Roots, and Cut Flowers. Applications for Forms of Certificates of Entry, Prize Lists, and Regulations for Poultry, &c., to be made to the Secretary, and for Flowers, &c., to Mr ALFRED LOCKYER, Secretary, Farningham. By Order of the Committee of Management, BAPTISTE THOMAS, Secretary.

Committee Room, Lion Inn, Farningham, Kent.

PROFESSOR EDWARD FORBES' LECTURES on the FORMS and COLOURS of ANIMALS and PLANTS will not take place at the Normal School of Art, Marlborough House, Pall Mall, in consequence of his Appointment to the Regius Professorship of Natural History at Edinburgh.

EXHIBITION OF TULIPS.

HENRY GROOM, Clapham Rise, near London, by Appointment Florist to Her Majesty the Queen, and to His Majesty the King of Saxony, respectfully announces that his EXTENSIVE COLLECTION OF TULIPS is now in flower, and may be viewed every day from 9 o'clock until 6 (Sundays excepted).—Admittance 1*s.*, Children half-price.

EXHIBITION OF TULIPS.

W. H. LAWRENCE, of the Red Lion, Hampton, begs to inform his friends and the public, that his unrivalled Collection of TULIPS is in bloom, and will continue to the end of the month.—Admittance Gratis.

EXHIBITION OF TULIPS, PELARGONIUMS, CINERARIAS, PANSIES, ETC.

C. TURNER'S extensive Collections of the above are now in fine bloom, and may be viewed, Sundays excepted, for the next three weeks.

Royal Nursery, Slough, May 13, 1854.

EXHIBITION OF SPECIMEN PLANTS.

J. AND J. FRASER beg to invite the attention of the Nobility and Gentry to an inspection of their fine collection of Specimen CHINESE AZALEAS and other plants, which are now in bloom. The plants are so arranged in various Greenhouses as to have a similar effect to that produced at the Metropolitan Flower Shows. The collection comprises those specimens which have been exhibited so often at the Regent's Park and Chiswick Gardens, at which places they have taken the leading prizes.

The Nursery is about 15 minutes' walk from the Lea Bridge Station on the Eastern Counties Railway. Trains leave London at 9 a.m., 9.30 a.m., 10 a.m., 10.40 a.m., 12.30 a.m., 1.40 p.m., 2.30 p.m., 3.20 p.m., and 4.45 p.m.—Admission Gratis.

Lea Bridge Road, Essex, May 13, 1854.

JOHN HOLLAND offers superb named SHOW PANSIES, at 4*s.* per dozen Plants. Extra fine selected PANSY SEED, 1*s* and 2*s.* per packet.

Bradshaw Gardens, Middleton, near Manchester.

BEAUTIFUL NEW VARIEGATED-LEAVED PLANT, "APHELANDRA LEOPOLDI."

JAMES VEITCH, JUN., of the Exotic Nursery, Chelsea, begs to inform all collectors of plants with Striped and Variegated Foliage, that Mr. L. Van Houtte, of Ghent, has appointed him his agent in this country, for the sale of this fine and distinct Plant. The foliage is of a light glossy green colour, regularly and distinctly marked with white stripes, not fading or running with age. In addition to its lovely foliage, it has beautiful Flowers; thus rendering it a decided acquisition to every stove; indeed, no collection of variegated-foliaged plants will be complete without it.

J. V., jun., has fine Plants ready for delivery at 21*s.* each, with one over to the trade when three are taken.—Chelsea, May 13.

N.B.—A beautiful Plate will be sent, without charge, to persons taking three Plants.

BEAUTIFUL NEW PETUNIA.
"MONTREAL PURPLE" (SMITH.)

W. F. SMITH, Riverhead Nurseries, near Sevenoaks, will be prepared to send out, on and after May 1st, strong plants of the above splendid Petunia, at 3*s.* 6*d.* each. This variety possesses a first-rate habit, and produces fine large bold flowers of good form, well above the foliage; and it has proved to stand the wind and rain better than any other variety.

W. F. S. is confident that the above will give as much satisfaction as the Geranium "Lady Holmsdale," and Calceolaria "Beauty of Montreal," sent out by him in 1852. W. F. S. has also some splendid Plants for vases of Geraniums "Lady Holmesdale" and "Flower of the Day," from 20*s.* to 30*s.* per dozen.—Catalogues of Stove, Greenhouse, and Bedding Plants may be had on application.

TO TURNIP GROWERS.

TURNIP GROWERS *who have not yet procured their supply of Seeds are recommended to peruse* MESSRS. SUTTON'S *Descriptive List of new Turnip Seeds, at page* 298 *of the present Number of this Paper.*

NEW TURNIP SEEDS DIRECT FROM THE GROWERS.

WILLIAM E. RENDLE AND CO. have this season a very superior stock of all kinds of TURNIPS, and they recommend all who are in want of the best varieties to procure their "Farming Price Current and Agricultural Directory," to be had in exchange for six penny stamps.—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

DAHLIAS, GERANIUMS, FUCHSIAS, AZALEAS, BEDDING PLANTS, &c., can be had from WILLIAM E. RENDLE AND CO., NURSERYMEN, Plymouth, in any quantity. Their New Plant Catalogue is now out, and can be had in exchange for one penny stamp.—Apply to

WILLIAM E. RENDLE AND CO., Nurserymen, Plymouth.

FINE GRASS SEEDS FOR ORNAMENTAL PARKS, LAWNS, &c., *where a fine sward is required,* 1*s.* 3*d. per lb.,* 3*s. per gallon, and* 20*s. per bushel. Our mixtures for this purpose have given the greatest satisfaction.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

BASS AND BROWN'S NEW POTENTILLAS.—In consequence of the limited stock of King of Crimsons, we regret we must decline receiving more orders. The following are now ready to send out:—

Potentilla Sudbury Gem, each	10*s.* 6*d.*	Potentilla Theodore, each	7*s.* 6*d.*
„ Shylock, do.	10 6	„ Julia, do.	7 6

The following, 16*s.* the set of seven varieties:—

BEDDING PLANTS.—Many thousands will be ready in May, 3*s.* to 6*s.* per dozen, or cheaper if 100 are taken.

ROSES.—Tea, Bourbon, and Hybrid Perpetuals, and new ones, on the Manetti stock.

HERBACEOUS PLANTS, fine and good, 20*s.* to 30*s.* per 100.

Orders above 20*s.* paid to London. Lists upon application, enclosing a stamp.—Nurseries, Sturmer, Halstead, Essex.

FIRST-CLASS DAHLIAS.

MITCHELL'S DUCHESS OF SUTHERLAND AND SULPHUREA ELEGANS.

JAMES MITCHELL will send out, early in May, his two unrivalled Seedling Dahlias—DUCHESS OF SUTHERLAND, white, mottled, and edged with crimson, the most beautiful and constant Show Flower ever offered; 24 blooms exhibited at the Surrey Gardens in September, 1853, and much admired; also First-class Prize at Maidstone, by Messrs. Neville and others; 4 feet, 10*s.* 6*d.* SULPHUREA ELEGANS, primrose-yellow, exquisite form, first-rate, and constant show flower, 4 feet, 10*s.* 6*d.*

MITCHELL'S NEW BLUE VERBENA ELEGANTISSIMA, an improvement on Mons. Paguin; the above magnificent Verbena at 2*s.* 6*d.* each. No discount, unless six are ordered.—Piltdown Nurseries, Marcsfield, Sussex.

CHOICE BEDDING PLANTS.

IN THE "GARDENERS' CHRONICLE" OF LAST WEEK

YOUELL AND CO.

Advertised a SELECT LIST of the above for present Planting, to which they beg to refer.

Royal Nursery, Great Yarmouth.

SUTTON & SON'S GENUINE NEW TURNIP SEEDS.

ONE of the finest Exhibitions of Turnips and other Roots (open to all England), was held at the Reading Cattle Show, on December 1, 1853. The Editor of the *Reading Mercury*, in alluding to this Show, made the following remarks:—"The Turnips exhibited on the 1st inst. in this town by J. B. Kitcat, Esq., to which prizes were awarded by the Reading Farmers' Club, were SUTTON'S Lincolnshire Red Globe. These roots were much admired for their extraordinary size (being nearly a yard in circumference) and globular shape. J. B. Monck, Esq., produced some splendid specimens of Swedes, and R. Fellowes, Esq., some Yellow Globe Mangold, of equally fine quality."—See *Reading Mercury*, Dec. 3 and 10, 1853.

The following remarks are by the Editor of the *Berkshire Chronicle*, at the conclusion of his report of the above Show:—"No doubt the excellence of these roots must be mainly attributed to the cultivation; but it is worthy of remark that every prize was won by roots grown from Messrs. SUTTON'S seeds."

At the Annual Root Show held at Basingstoke, Hants, on December 21, at which a large number of prizes was awarded for root crops, the whole of the prizes (except two), were gained with the produce of our seeds; and we are constantly hearing from our customers in other parts of the kingdom of their similar success."

The following are the principal sorts exhibited at the above Shows:—

SECTION I.—SWEDISH TURNIPS.

ASHCROFT SWEDE.—We have great confidence in recommending this as the largest and one of the best Swedes in cultivation. Price 1*s.* 6*d.* per lb., or 9*s.* per gallon.

GREEN-TOPPED YELLOW SWEDE.—A very hardy variety, well known. Price 1*s.* per lb., 6*s.* per gallon, or 40*s. per bushel.*

SKIRVING'S LIVERPOOL SWEDE.—Our seed of this excellent Swede is particularly true, having been grown last summer from selected roots, which were raised from seed procured from Mr. Skirving. Price 1*s.* 3*d.* per lb., or 7*s.* per gallon.

RIVERS' STUBBLE SWEDE.—So called, because from its habit of rapid growth it may be sown later than other kinds. Price 1*s.* 6*d.* per lb., or 9*s.* per gallon.

SUTTON'S HARDY PURPLE-TOPPED SWEDE.—*Fine globe-shaped, with small top and one tap root, will stand the most severe winter, and is one of the best for storing.* It was selected from the East Lothian Purple-topped Swede, but is larger. Price 1*s.* 4*d.* per lb., or 8*s.* per gallon.

YELLOW TANKARD SWEDE.—A very heavy cropper, and of quick growth (leaves similar to common Turnip). Price 1*s.* 3*d.* per lb., or 7*s.* per gallon.

(FOR EARLIEST sowing we would recommend the Ashcroft or the Skirving's; for LATEST Rivers' Stubble; and for the MAIN CROP our Hardy Purple-topped.)

SECTION II.

YELLOW HYBRID, SCOTCH, AND BULLOCK TURNIPS.

SUTTON'S PURPLE-TOPPED YELLOW HYBRID.—The hardiest, largest, and most nutritious of all Hybrid Turnip. Although the leaf of this is similar to common Turnip, the bulb is similar and equal in value to a fine Yellow Swede. Time for sowing, June and early in July. Price 1*s.* 4*d.* per lb., or 8*s.* per gallon.

SUTTON'S GREEN-TOPPED YELLOW HYBRID, particularly adapted for poor soils and for late sowing, possesses same good properties as our Purple-topped Hybrid. Price 1*s.* 4*d.* per lb., or 8*s.* per gallon.

SKIRVING'S PURPLE-TOPPED YELLOW BULLOCK, grown from seed received from Mr. Skirving. Price 1*s.* per lb., or 6*s.* per gallon.

YELLOW SCOTCH (Aberdeen), Green-topped or Purple-topped, price 1*s.* per lb., or 6*s.* per gallon.

CHIVAS'S ORANGE JELLY, a most excellent sort for late sowing. We have a fine choice stock grown from seed received from Mr. Chivas, which we can recommend as perfectly true and strong growing seed. Price 2*s.* per lb. We can also supply, if preferred, seed direct from Mr. Chivas, who has appointed us Agents for the sale of his Orange Jelly Turnip Seed. Price same as at Chester.

SUTTON'S CRUICKSFIELD HYBRID SWEDE, a valuable new Hybrid, between Kohl Rabi and Skirving's Swede. To be sown at the same time and cultivated in the same manner as Swedes. *Peculiarly adapted for poor soils, and stands the driest summer without mildewing. It is also useful for transplanting to mend other crops or fill up headlands and corners.*

SECTION III.—WHITE-FLESHED TURNIPS.

YORKSHIRE PARAGON TURNIP.—A fine new White Globe Turnip, as solid and nearly as large as Lincolnshire Red. Price 1*s.* 6*d.* per lb., or 7*s.* per gallon. Mr. Stratten, one of the most successful breeders of stock, who has had great experience in fattening cattle, particularly recommends this sort.

SUTTON'S LINCOLNSHIRE RED GLOBE TURNIP.—A superior variety, presented to us by Philip Pusey, Esq., being more solid and larger than any other. Price 1*s.* 6*d.* per lb., or 9*s.* per gallon.

From Mr. Albert Edmonds, Steward to Philip Pusey, Esq., November 23, 1853.

"By the desire of Mr. Pusey, I beg to inform you that he had a very fine crop of the Red Lincolnshire Turnip, weighing 30 tons 10 cwt. 1 qr. 24 lbs. per acre."

From Mr. T. Chandler, Manufacturer of Liquid Manure Drills, Aldbourne, Hungerford, November 11, 1853.

"The Lincolnshire Red Turnip, the seed of which I had from you, has produced the heaviest crop I ever grew."

SUTTON'S IMPERIAL GREEN GLOBE TURNIP.—Shape of Matson's, much larger and quite hardy. *This should be sown for the main winter crop, instead of the Common Green Round Turnip.* Price 1*s.* 4*d.* per lb., or 8*s.* per gallon.

COMMON GLOBE TURNIPS, True White, and Red Globe; two large early sorts, well known. Price 1*s.* per lb., or 6*s.* per gallon.

TANKARD TURNIPS, Red, White, and Green, either sort may be had separate. Price 1*s.* per lb., or 6*s.* per gallon.

NORFOLK ROUND TURNIPS, Red, White, and Green, useful sorts, well known. Price 1*s.* per lb., or 6*s.* per gallon.

SUTTON'S EARLY SIX-WEEKS.—The quickest Turnip known, very sweet and solid, the best for sowing very early or very late. Price 1*s.* 4*d.* per lb., or 8*s.* per gallon.

Our Turnip Seeds are all of home growth, from selected roots, and being genuine new seeds, may be sown moderately thin, with certainty of a crop.

The following are extracts from a few of the many letters we receive to the same effect from our customers:—

From J. Hanson, Esq., Culgaith, Penrith, Cumberland, Jan. 10, 1854.

"The Turnip Seeds I had from you last season answered beyond my expectation, and exceeded by far any that I procured elsewhere. I should have been many pounds in pocket if I had procured all I wanted from you."

From Charles Hayward, Esq., Bromhill, near Taibach, Jan. 7, 1853.

"The seeds I had from you were entirely satisfactory; several of the Ashcrofts, when trimmed, weighed 12 lbs., and I saw none surpassing them in Baker Street last month."

From G. Churchward, Esq., Stoke Gabriel, January 13, 1854.

"I had Turnip seed of you last year, which answered very well. The Lincolnshire Red Globe is a very good Turnip, and so is your Purple-top Yellow Hybrid."

From Marchbank Woods, near Moffat, N.B., March 16, 1853.

"The crop of Sutton's Purple-topped Yellow Swede last year has kept better than any other Turnip."

From H. F. Cotton, Esq., Quex Park, near Margate, March 26, 1853.

"The Six Weeks' Turnip answered admirably."

Orders by Post addressed JOHN SUTTON & SONS, Seed Growers, Reading, Berks, will have immediate and careful attention.

CAPE HEATHS AND NEW AZALEAS.

W. J. EPPS begs to call attention to his extensive and rare Collections of Heaths and Azaleas, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c. AZALEAS—Prince Albert, Gledstanesi, Excelsa, Murrayana, Alba magna, Duke of Devonshire, Holderi, Toilette de Flora, Glory of Sunning Hill, Symmetry, Splendens, Ignescens, &c., &c., 9*s.*, 12*s.*, 18*s.*, and 21*s.* per dozen; 5*l.* per 100 varieties, carriage paid to London. All the new Stove and Greenhouse Plants, Fuchsias, Verbenas, and Roses, equally moderate. Catalogues of the above sent on application.—Nurseries, Maidstone and Ashford.

BEAUTIFUL NEW BEDDING PLANT.
MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s.* per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

ABRAHAM STANSFIELD, NURSERYMAN, SEEDSMAN, and LANDSCAPE GARDENER, Todmorden, Lancashire, having a large Stock of the following, can supply them at the under-mentioned prices:—

50 species of the genus SAXIFRAGA, at 15*s.* per 100, or 4*s.* per dozen.

400 species of select Plants adapted for Rockwork, at 30*s.* per 100, or 4*s.* per dozen.

600 species and varieties of Alpine and Hardy Herbaceous Plants, 25*s.* per 100, or 4*s.* per dozen

150 species of Hardy and Greenhouse FERNS and LYCOPODS, from 6*s.* to 24*s.* per dozen.

SCARLET GERANIUMS and other Bedding Plants, 4*s.* p. doz.

N.B. A few bushels of genuine Fluke Potato, at 8*s.* per bushel.

Catalogues on application.—A remittance or reference from unknown correspondents.

MAY'S PARAGON CABBAGE.

THE SUBSCRIBER, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28 lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ¼ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

GRASS SEEDS, ETC.

THOMAS GIBBS AND CO. (the SEEDSMEN to the Royal Agricultural Society of England), corner of HALF-MOON STREET, Piccadilly, beg to draw attention to their Grass Seeds for Laying down Land to Permanent Grass. The Seeds which they employ in forming the Mixtures for various soils are well cleaned under their own superintendence.

" Hybrids, Gibbs' Green Top
" Globes, Tankards, &c.
FARM SEEDS of all descriptions.

Priced Lists, Detail Catalogues, and other information can be obtained on application to THOMAS GIBBS & CO.

SEEDLING VERBENAS.

W. J. EPPS has great confidence in recommending the following Seedlings, raised by Mr. Philpot, of Aldington, being without exception the most distinct and splendid flowers in their class yet offered to the public. The following are the opinion and description given by Mr. Neville, editor of the *Gardeners' Record;* they were exhibited at Ashford open Show, in September last, and received first-class certificates.

No. 1. SULTAN.—Dark velvety maroon; large white eye; petals stout; pip, full size; truss, medium; a beautiful variety.

No. 2. BLUE BELL.—Dark velvety blue, with white eye; truss very large and well formed.

No. 4. INDIAN CHIEF.—Crimson puce, very rich in colour; yellow eye; very attractive.

No. 5. DELICATISSIMA.—Pale lavender, with large primrose eye; very beautiful and novel; petals, stout; pips, well formed; truss, medium.

No. 8. RUFUS.—Plum colour purple; velvety texture; dark disc; with a clear white margin; immense flower and trusser.

No. 20. DISTINCTUS.—Cherry lavender grey disc; distinctly margined with dark crimson purple; fine bold truss and large flowers.

The whole of the above are exceedingly free flowering, and excellent habits—well suited for bedding or other purposes; 12*s.* 6*d.* the collection.

SEEDLING PHLOXES.

These are, without exception, the most lovely things in their way possible; they have been much admired by all who have seen them, and have merited the high opinion of the editors of the leading floricultural works. The following is the description from the *Gardeners' and Farmers' Journal*, Sept. 21st, 1853:—

"SEEDLING PHLOXES.—The collection of Seedling Phloxes received is remarkable for novelty and superiority of form.

No. 1. MARIA.—Rose peach, with white eye.
No. 3. ASTROSANGUINEA.—Fine crimson.
No. 4. DISTINCTUS.—Light purple, white eye.
No. 5. CARMINATA.—Deep rose, white eye.
No. 7. SPLENDENS.—Large lilac, white eye.
No. 8. CONSPICUA.—Very deep rose, white eye."

10*s.* 6*d.* the collection.—Nurseries, Maidstone.

NEW AND CHEAP PLANTS.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, begs to offer the following, in strong and healthy Plants. Most of the GERANIUMS are set with flower buds:—

GERANIUMS of 1853.—Queen of May, National, Eleanor, Rachel, Heroine, Leonora, Lagoma, Cordelia, Rolla, Butterfly, Commander, and Jupiter: the above 12 for 1*l.* 8*s.*, hamper included.

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of genuineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "*Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th of June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have increased so much that I must now cancel my former order, and beg you to supply me according to the list now furnished.*"

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of *Gardeners' Chronicle*, March 11.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

New Greenhouses, Conservatories, &c., furnished with all the best new Climbing Plants, &c. For price, &c., see Catalogue.

A Selection of the most approved Flower Seeds, 18 Papers, 5s.; 36 Papers, 10s., sent free by post.

Albion Nursery, Stoke Newington, London.—May 13.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21s.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gauffred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21s.

WIVERY'S SPRING CATALOGUE can be had on application, post-free; and he begs to offer a few good and select Plants for Bedding.

LOBELIA ERINUS CÆRULEA ALBA, Seedling of 1853; colour, bright sky-blue, with white throat, much larger flower than any of the Erinus tribe; strong grower, and very free bloomer, decidedly the best of the class, 2s. 6d. each, or 21s. per dozen, strong plants.

GERANIUM — Trentham Rosy Scarlet, a beautiful variety, compact habit, large trusser, quite distinct in colour; must become a great favourite for bedding, 2s. each, or 18s. per dozen.

GERANIUM — Golden Chain, fine healthy plants, 18s. per dozen; extra size, 2s. 6d. each.

GERANIUM—Flower of the Day, strong healthy plants, 9s. to 12s. per dozen.

CALCEOLARIAS—Beauty of Montreal, Brilliant, Crimson King, Magnificent, Model, Gold Cap; the above are splendid varieties for bedding, 18s. per dozen. Other good varieties from 6s. to 12s. per dozen.

Also a fine stock of VERBENAS, SCARLET GERANIUMS, PETUNIAS, and all other bedding plants, at moderate prices.

W. I. has a fine stock of the best Show, Fancy, and mixed GERANIUMS, FUCHSIAS, CINERARIAS, AZALEAS, Winter Flowering CARNATIONS, Pompone and large Flowering CHRYSANTHEMUMS, Herbaceous and other Miscellaneous Plants, too numerous to insert here.

Hanover Nursery, Peckham, near London, May 13.

TO FLORISTS.

ROBERT M. STARK begs to intimate that he will send out early in April the under-noted FLOWERS, which he is confident will be useful additions to any collection.

PANSY "TELEGRAPH" (STUART'S).—A fine dark plum-coloured self, of great substance; was a conspicuous flower in stands which gained 10 first prizes last season. Price 5s. each.

VERBENA "LEUCOSTEMMA" (MEIN'S).—Pure white, very large compact truss. Certificate of Merit from Caledonian Horticultural Society in 1853. Price 5s. each.

Edgehill Nursery, Dean, Edinburgh, May 13.

The following Choice Hybrid Perpetual Roses, at 30s. per doz.: Dr. Assas, Destigny, Diodore, Egerie, Genié de Châteaubriand, Inermis, La Seduisante, L'Enfant du Mont Carmel, Léon le Guay, Louise Odier, Laura Raymond, Louise Peronny, Ludovic Letaud, Madame Andry, Madame Flory, Madame Ducher, Madame Hilaire, Madame Rivers, Rose de Soil, Souvenir de la Reine des Belges.

BENJAMIN R. CANT, in offering the above, does so with the greatest confidence, as he has received several letters from customers stating that the plants sent are far better than those generally supplied by the Trade.

ST. JOHN'S STREET NURSERY, COLCHESTER.

Carriage paid to London and Norwich and all intermediate stations on the Line. Unknown Correspondents are requested to send a remittance or reference.

EUGENIA OR MYRTUS UGNI.

MESSRS. VEITCH AND SON, of Exeter, and the Exotic Nursery, Chelsea, have much pleasure in offering to the Public the above beautiful evergreen flowering shrub, of THEIR OWN introduction, from Patagonia, through their collector, Mr. Wm. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by its Strawberry-flavoured red berries, eaten in Chili as dessert. It is a plant of easy culture, flowering in a very small state, when not above 6 inches high, and is well adapted for pot culture. It is figured by Sir Wm. Hooker in Curtis's "Botanical Magazine" for January, 1852.

Strong blooming plants, in 48-sized pots, 21s. each.
Second size do. in 60-sized pots, 15s. each.

With the usual discount to the Trade, and one over on either class when three are taken.—Exeter, May 13.

STAR NURSERY, SLOUGH.

WILLIAM BRAGG begs to inform the Floral world that his Catalogue of DAHLIAS for 1854 is now ready, and can be had gratis on application. "The Beauty of Slough," which was figured in last month's "Florist," is now ready to send out. Likewise his choice new set of Nine VERBENAS, which has taken several First-class Certificates at the National and other Floricultural Societies. Also the new dark Horseshoe-leaved Geranium "Glory," which obtained a Certificate at the National, is now ready. This splendid variety will prove a great acquisition as a pot or bedding plant.

W. B. has still on hand a good Stock of Hollyhocks, Geraniums, Fancy Geraniums, Pansies, including his four new ones; several hundred dozens of Bedding Plants, Chrysanthemums, Verbenas, Fuchsias, Phloxes, Roses, &c. Choice Pink, Pansy and Hollyhock Seeds, in packets 2s. 6d. each, post free.

All Parcels carriage paid to London, and plants given to compensate for carriage.—May 13.

PAGE AND CO.'S

BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. 4s. per gallon, sufficient to make four. For testimonials see back leaf *Gardeners' Chronicle,* March 11, 1854.

GARDEN AND AGRICULTURAL SEEDS, first quality, and lowest market price.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

RENDLE'S IMPROVED SWEDE TURNIP.—*The Stock of this excellent Swede has been grown for us this season by R. H. Watson, Esq., Dorsley, near Totnes. It is a most hardy and valuable variety. Price* 1s. 6d. *per lb. For further particulars and testimonials of its excellence see* "FARMING PRICE CURRENT," to be procured from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

SEEDS TO IRELAND.—*Plymouth is admirably situated for supplying our sister country with some English Seeds. The Subscribers can refer to some of the leading families in Ireland, who have for many years obtained the whole of their supplies of Garden and Farm Seeds. Seeds delivered free to many of the Irish ports. See Price Current.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

SUTTON'S GRASS SEEDS.

EXTRACT OF A LETTER FROM DR. LINDLEY:—

"Messrs. SUTTON,—*We have already made trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(*Signed*) "JOHN LINDLEY.

"*Horticultural Society,* 21, *Regent Street, London, Nov.* 9, 1853."

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1s. 3d. per lb., 3s. per gallon, or 21s. per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, for forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.

SUTTON'S GRASS SEEDS *for forming Permanent Pasture,* 24s. *to* 30s. *per acre ;* SUTTON'S RENOVATING MIXTURE *for Improving Old Pastures,* 1s. *per lb.*

JOHN SUTTON AND SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, MAY 13, 1854.

COUNTRY SHOWS FOR THE MONTH OF MAY.—15th: Hammersmith Pansy.—18th and 19th: Exeter.—23d: Handsworth and Lozells.—24th: Notting ham and Colchester.—25th: Derby.—26th: Bury St. Edmunds.—29th Hunslet.—30th: Truro.

INQUIRIES are beginning to be made respecting a plant which is called in the United States the OSAGE ORANGE. An American newspaper informs its readers that the Illinois railway company has contracted for hedging, with the Osage Orange, a hundred miles of their line. Another American journal declares it to be the best hedge plant that has been discovered in this or any other country. Prof. TURNER, of Jacksonville, says—"Our hedges are indeed splendid; when three or fours years old they will turn anything. I wish you could see them in all their glory, bidding a sweet defiance to man, pig, and fowl of all sorts."

Seed has now begun to reach the English market, as we see from Messrs. CHARLWOOD & CUMMIN'S circular, where it is quoted at 4s. per pound; and we know that parcels are in some private hands. We must therefore explain what this Osage Orange is, and what the probability of its succeeding in this country.

In the first place it is not an Orange at all. It is so called because its fruit is round and yellow; but it is worthless as a fruit tree, and is more nearly allied to a Fig or Mulberry than to any plant common among us. Botanists call it *Maclura aurantiaca.* It has been for many years in cultivation, but has met with no attention here, because it neither flowers nor fruits. It appears, however, to be perfectly hardy; as indeed it must be, when we remember that it supports the winters of Ohio, where the thermometer sinks to 20° *below zero.*

As a hedge plant it may be expected to merit

among us all that is told of it in the United States; unless, indeed, we except the rate of growth, which is said to be 5 or 6 feet in a season in North America. With our cold soil it cannot be expected to grow faster than Whitethorn. After a few years, when it may be supposed to have formed a hedge, its growth is extremely slow, both in the United States and here.

It is a sturdy, deciduous tree, or rather bush, with strong hooked spines, through which it would be extremely difficult for any living thing to find its way if the branches are once interlaced, as in a well-shaped hedge. The mode of compelling it to do this is described at length in a pamphlet now before us, from which we extract the more important practical details :—

"If the seeds are procured in spring, planting may be deferred until the ground has become warm. In the latitude of New England, any time during the month of May has been found to answer. In order to have them vegetate quickly, they should be put to soak in soft warm water, and allowed to remain three, four, or five days, or until they are very much swollen, and the germ has begun to appear. Keep the water constantly warm by allowing the vessel to stand in a warm place covered with a cloth, and change the water daily, to avoid fermentation ; mix with a little dry earth or sand when you get ready to plant. The ground for the nursery should be a rich sandy loam, deeply worked and finely pulverised. Proceed to lay it out in drills 18 inches apart, and drop the seed at intervals of half an inch in the row ; cover firmly with fine earth a few inches deep. They should be well attended to throughout the season, in order to secure as large a growth as possible. A quart of seed will produce 3000 or 4000 plants. It sells in America for a dollar a quart. It will take 10,000 or 12,000 plants for a mile of hedge.

"In preparing for the hedge, unless the soil is very mellow and rich, a trench not less than 2 feet wide, and as deep, should be dug on the line where the hedge is to stand, and filled up with equal parts of well-rotted manure or compost, and rich earth. Planting may be done after warm weather has commenced in spring. The plants should be prepared for setting by shortening the roots to within 8 or 9 inches, and the top to within 1 inch of the root. Select those of a uniform size as the best to be planted together ; stretch a line where the row is to stand, and set out the plants not more than 10 inches apart, in a single line thus— * * * * or diagonally, thus—* * * * * * making them a foot apart in each row. It is recommended never to set the plants further apart than stated above, as at greater intervals the stalks must grow larger and the roots extend proportionally; besides, it requires much more labour in pruning, for which the saving in plants is by no means adequate. As regards the single or double row, Prof. Turner and others maintain that a single line is all that is necessary or desirable, while some are inclined to the latter method. Either undoubtedly answers the purpose well.

"The Osage Orange will bear almost any amount of trimming, and a hedge sufficiently firm and compact at the base can be made in no other way than by regular and severe cutting down. The spring succeeding, or one year from the setting, cut all down to within 4 inches of the ground. In consequence of the first pruning at the time of setting each plant will have thrown out three or four shoots. The second cutting will cause these to multiply to six or eight, which will nearly fill the space between the plants. A second trimming should be given when the plants are making a vigorous growth, from the middle to the last of June, cutting off the tops smooth and even to within 4 inches of the ground. The next spring cut to within 5 inches of the preceding cutting, and in June likewise. Continue these spring and June prunings, increasing the distance an inch every year until the hedge shall reach the height desired. The side and lateral branches may be pruned and thickened so as to render it impenetrable to a bird. As regards the shape of the hedge, the taste of the grower will dictate. A neat and most convenient shape for a strong hedge is about 5 feet high and 3 feet wide at the bottom, gradually narrowing so as to render the top like the ridge of a house. The growth after a few years is quite slow, and the shoots so fine that one can scarce believe it to be the same plant. One trimming a year will probably be all that will be necessary, except for ornamental hedges.

"The Osage Orange will be found a most efficient protection to orchards as gardens, as it is much easier to scale any kind of board fence that can be made, than an Osage Orange hedge 5 feet high. It is highly ornamental, and will also be found very suitable and appropriate for enclosing churchyards and cemeteries."

WE were in error when we reported, last week, upon the authority of a morning paper, that Mr. KENNEDY had resigned the office of COMMISSIONER OF WOODS AND FORESTS. It now appears from the proceedings in Parliament that the right hon. gentleman has been DISMISSED. So violent a measure as this requires such a justification as we are unable to believe possible. Mr. KENNEDY is a very old public servant ; Parliamentary records show that he has fulfilled with untiring zeal what he supposed to be his duties. That in the performance of these he should give offence to the gentlemen who brought the Royal forests to their present condition was inevitable, unless, indeed, he chose to follow in their steps. The moment that he was found to be independent, he became insufferable ; and, we should say, from the evidence afforded by the Blue Books, that his removal has been for some time decided upon. The difficulty was to find the opportunity ; but that opportunity was sure to occur where the reformation of a great branch of the public service had to be conducted without support, and in the face of resistance at all points. We earnestly hope, for the sake of public men, that the rumour is groundless which declares that the hostility to Mr. KENNEDY was actively promoted by powerful persons resolved, at all hazards, to force one of the old deputy surveyors into the surveyorship of the Forest of Dean, which Mr. KENNEDY thought the public interest required to be placed in charge of an experienced forester of known abilities.

It may be inferred, in the absence of official information, that the removal of Mr. KENNEDY is, like that of Mr. BROWN, in some way connected with the unpublished report of the referees appointed to inquire into the conflicting statements respecting Alice Holt Forest. We are not for a moment prepared to defend some of the expressions which led to the inquiry in question; on the contrary, we condemn them as much as any man ; but it is evident that they arose out of zeal for the public service, and surely of themselves could form no ground for the recent act of the Treasury. If every public officer who allows his sense of duty to betray him into the use of strong language—unjustifiable language, if that sounds better—is to be removed from the public service, we shall indeed be handed over to the oligarchy of what Mr. DISRAELI audaciously calls Tadpoles and Tapers.

What the report of the referees may be we care not to know. We shall assume that it forms a justification of the removal of Mr. BROWN. But is it possible to believe that any value can be attached to a document prepared as we now know was the case with that report ? We have already objected to the constitution of the tribunal ; one of this triumvirate was an agent of the Treasury, and that alone throws discredit upon the whole transaction. But the manner in which the enquiry was conducted was very much more objectionable. The referees were to enquire into the truth of certain statements and counterstatements made by A and B. The statements related mainly to the number and dimensions of the trees standing in a Royal forest. Such an enquiry is not the easiest to conduct, and the best men living may make serious errors in carrying it out. But what was the course which the referees pursued ? They met ; they sent for the wood men, that is to say for the servants of A, and with their assistance, and under their guidance, they proceeded to the examination of the ground. We believe that A was not examined by the referees ; but his servants, his own partizans, parties to the dispute, and, moreover, menial dependents, who knew that their bread depended upon the breath of A, are taken as guides and assistants in the investigation. B, on the other hand, against whom most undoubtedly the examination was directed, was not sent for by these referees ; although he was within a few miles of the seat of the enquiry. Upon writing to them to ask if he could be of assistance he was told that he was not wanted. And in this most unfair manner the materials for the report were collected. In such a report, be it what it may, an impartial person can place no confidence ; and we cannot believe that it will find favour with the House of Commons.

Had the referees been all independent of the Treasury ; had they requested A. to explain on the ground how he arrived at his averages ; had they called upon B. in like manner to show them his way of arriving at results ; had they moreover strictly examined both parties upon the letters sent by them respectively to the Treasury ; and had they then drawn up their report, the public would have been satisfied. But as matters have been managed the whole affair is discreditable—it has been a secret inquisition, not an open enquiry—and the report, appear when it may, will be a piece of waste paper.

We have no desire to screen B., or any other person, be his station high or low. When men commit faults they must expiate them. But they must first be proved to have committed them ; not by petty star-chamber tribunals, but by fair and open trial. No such trial has taken place in this case, and we enter an indignant protest against the un-English way in which the enquiry in question has been conducted by the Treasury. If such proceedings are tolerated, no public officer is for a moment safe, but may expect to become the victim of official intrigue as soon as he becomes disagreeable to the powers in Whitehall.

HAVING seen that in India and China some of the most common plants are employed for MAKING PAPER, it is obvious that the same or similar materials may be used in Europe for the same purposes ; and this, notwithstanding that it is sometimes stated that the difficulty is considerable in making paper from fibres that have not been previously woven, because the material does not draw easily through the machinery in use. But as this difficulty has been overcome, both in the case of the paper made from straw and in that made from wooden shavings, it can be so in other instances.

As there is no doubt that many of our colonies could supply material fit for paper making, it is only necessary to inquire whether this can be done at a sufficiently cheap rate. We believe that it is possible to do so, from the rate at which a product like cotton, forming but a small portion, as it does, of a large plant, can be supplied by the Indian agriculturist, and the low price at which a fibre like that of Corchorus olitorius (the Jute of India), can be cultivated, prepared, and sent to market solely on account of its fibre.

In climates similar to that in which the Jute is so easily cultivated, there are other plants which grow as large and without any culture, or are cultivated for other purposes, and their fibre is now only refuse. Some, at least, of these, we believe, might be collected and sent to this country with profit both to the Indian farmer and to the English merchant.

The Chinese, for instance, make paper of Rice straw, as well as of Bamboos, and the Hindoos make ropes of different Grasses. Some of these belong to the genus Saccharum, of which there are, in many parts of India, extensive jungles, which the natives every year burn down, in order that the young Grass may spring up, and afford pasturage for their cattle. It is possible that in some situations, as near navigable rivers, this Grass jungle might be cut down and converted into half-stuff for paper.

Among cultivated plants, there is probably not one so well calculated to yield a large supply of material for paper as the Plantain (Musa paradisiaca). It is so common throughout all tropical countries, growing in rank luxuriance along rivers and at the foot of hills, concealing the humblest hut, or forming avenues in the gardens of the rich, or plantations round their boundaries. Every root stock that is planted will, besides the central stem, throw up from six to eight or ten similar stems, which consist, in fact, of the central flower stalk surrounded by the sheathing leaves. Each producing its bunch of 30 or 40 lbs. weight of fruit requires to be cut down to make room for fresh shoots. The fruit when fully ripe is bland and nutritious, supplying, in some measure, the place of bread ; if more is cultivated than can be consumed, the fruit can be preserved, or its meal separated. Each stem contains from 3 to 4 lbs. of fibre, fit for cordage or for paper making ; and that excellent paper can be made from it, was lately shown at the meeting in Regent Street, both for packing and for drawing-paper, and also of a fine quality for note-paper. We believe that the refuse stems of this plant, which are too watery to burn, and contain too much fibre to rot readily into manure, would of themselves supply a great part of what is required. The tow, moreover, of some Agaves, Yuccas, Bromelias, and Sansevieras, might be similarly employed.

Some Malvaceous plants are cultivated as articles of diet ; for instance, Hibiscus esculentus, the *okhro* of the West Indies and of the United States, of which the mucilaginous fruit is esteemed as a vegetable, and as an addition to soup. It abounds in fine fibre. So also H. longifolius, the *ram turai* of India, is similarly employed. The cultivation of these plants might be extended in the neighbourhood of towns, where there would be a demand for their fruit. H. Sabdariffa, again, esteemed for its acid calyces. The edible and other species of Grewia also abound in useful fibres.

The family of Malvaceæ and its allies, moreover, contain many plants of quick growth and large size, which abound in fibres, and might, on this account, be collected, or even cultivated, and the tow employed for paper making. Species of Hibiscus and of Sida are already cultivated on account of their fibres, of which the refuse is converted into paper in India and China.

Flax is too valuable to be sacrificed for paper making, but there are countries, such as India, which grow enormous quantities of the plant, on account of its seed (Linseed), which is exported in thousands of maunds, but of which the fibre is nowhere made any use of. Though this, from the nature of the climate, may not form the best Flax, yet there is very little doubt of its being sufficiently good for conversion into paper, and the expenses of culture are already paid by the profits on the Linseed.

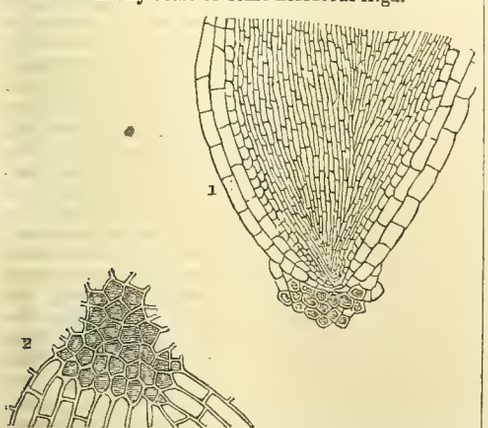
Among the Nettle and bread-fruit tribes various plants are cultivated for their fruit or for other purposes, which also abound in fibre well fitted for making paper. The Chinese, we know, employ Broussonetia, formerly Morus papyrifera, for this purpose; we believe that the refuse cuttings of the bush cultivation of the Mulberry in India might be turned to useful account. The barks of many species of Artocarpus are covered with a thick layer of fibrous material. The stinging and the stingless Nettles (Boehmeria) abound in fibres which rival the hemp in strength, and much of their tow might be converted into paper, if not employed for mixing with wool. The Hop Vines of Europe ought, moreover, to be turned to some account.

Without noticing the weeds of tropical countries which grow in such rank luxuriance, and among which are species of Sida, of Urena, Grewia, Corchorus, Triumfetta, all abounding in fibrous matter, there is evidently a great abundance of similar material in plants cultivated for other purposes, and which is at present thrown away. Some very simple machinery would greatly facilitate operations, and the expense of freight might be lessened by compression, or the rough material might be used as dunnage among cargo. This, with the cheapness of labour and of everything else in many of these countries, would enable material for paper-making to be brought thence in great abundance, and at a sufficiently cheap rate. But paper-makers must not expect that colonists are to make sacrifices to supply their wants, nor are the latter to expect better prices for their goods than what they are really worth, but they have a right to expect that not less than the full value should be given for even a new article. Remunerative prices will be not only for his advantage, but also for that of the consumer, as securing continued supplies of the raw material for his manufacture.

VEGETABLE PATHOLOGY.—No XIX.

81. Though, however, there is a constant interchange, as long as they are endowed with life, between every cell which enters into the structure of a plant, and the ascending and descending current are not confined to any special organs, there is doubtless a particular course taken by the main current which it is on many accounts important if possible to ascertain.

82. If the structure could be verified which was figured by M. Decaisne in the rootlets of Madder (Rubia tinctorum), in the Transactions of the Academy of Brussels in 1837, there would be great reason for asserting positively that the primary course was along the tissue which occupies the centre of the roots, the cells of which are represented as projecting at the tip and forming the spongelets. The structure, however, of young madder roots appears to us as represented in the annexed woodcut, in which the spongelet, as in other cases, is connected quite as much with the external as central tissue. The cells of the spongelet are very large, and when their protoplasm has assumed the proper madder tint, resemble closely those of some florideous Alga.



1. Vertical section of the tip of a young rootlet, in which the vascular tissue is not yet formed. 2. Tip of rootlet, as seen from above; the central cells of which are dark madder red, the next to them reddish yellow, and the outer yellow. The figure is taken from a short thick rootlet, which gave greater facility than the ordinary fine rootlets for making a thin section. The structure, however, is essentially the same in both, only in the latter the external cells are much longer.

83. In some true roots, however, lately communicated by Dr. Hooker, the external cells resemble closely the outer cells in the air roots of Orchids, and, after a time, like them, contain only air, being separated, moreover, from the central fascicle by tissue which appears almost impermeable, that of the centre itself being in part identical with that of the wood; it is probable, therefore, that the central fascicle is the more active agent for transmitting the ascending column of sap, which thus passes directly into the younger woody tissue, and from thence by their vascular bundles into the leaves, a lateral interchange in passing taking place between the woody tissue and the medullary rays, woody parenchym, amylyferous ducts, &c., in which matter is deposited for the future exigencies of the plant.

84. In the leaves, the sap which has already become more or less modified in passing, and has been more or less aerated by means of the vascular tissue, which, in all probability, not only is analogous to the Tracheæ* of insects, but very similar in function, is exposed to the more immediate influence of light and air, imbibing fresh elements from the atmospheric moisture, though parting at the same time with much aqueous matter by evaporation, and passing meanwhile into the surrounding parenchym, and from thence into the young bark, with which the parenchym is in immediate connection, from whence it is carried downwards, supplying materials in its way for the cambium, and finally restoring to the soil such excretory matter as would prove prejudicial if retained.

85. When the regular channel is deranged the course may vary for a time, but the effect of every new growth is to produce tissues which may restore matters to their ordinary condition; and even in such anomalous cases as new wood produced from the exposed surface of the youngest and most active tissues of the bark, adventitious buds appear, which at once establish the normal relations between the two new formations. *M. J. B.*

SOLLYA.

Two varieties of this genus, viz., heterophylla and linearis, although not deserving to be classed amongst the most showy inmates of our plant houses, are nevertheless worthy of a place in even limited collections. They are exceedingly easy to manage, soon form large specimens, and produce their pretty blue flowers long and profusely during the summer months, when a variety of flowering specimens of hard-wooded plants is much wanted.

Cuttings of short-jointed bits of the young wood in a half-ripe state, if planted in light peaty very sandy soil, and placed in a gentle bottom-heat, will be found to root freely, and both varieties seed freely. Cuttings are generally preferred; but whether obtained from seeds or cuttings, the young plants should be potted singly in small pots, as soon as they are sufficiently strong to bear handling, placing them in a rather warm, close, moist situation till they get established. It is always advisable to endeavour to have such things rooted early in the season, in order to allow of getting them strong and well established before winter. A cold frame will form the best situation for the growth of the young plants during summer, to which they should be removed as soon as the weather will permit, for there is nothing gained by keeping these plants in heat. The frame should be kept rather close and moist, and slightly shaded on the forenoons of bright warm days. Frequent stoppings will be necessary during the first season's growth, in order to get the plants well furnished at the base, and they must also be afforded plenty of pot room, and carefully supplied with water. In the case of persons not having had much experience in the management of such things it will, however, be advisable to avoid repotting later in the season than will allow of getting the pots moderately filled with roots before winter; for it requires some experience to properly supply recently potted plants with water. After about the middle of September the atmosphere should be kept less moist, and a free circulation of air afforded on fine days, in order to ripen the wood before the approach of winter. And the plants should be removed to their winter quarters before they are injured by the effects of damp or frosty weather. During that season they should be afforded a temperature of 35° to 40°, giving water carefully, and they should occupy a light airy position.

If large specimens are wanted without loss of time, growth should be induced early in spring, by removing the plants to a moist temperature of about 45°, allowing it to rise 10° or 15° higher with sunshine and air, and affording them all the light possible. Examine the state of the roots, and if more pot room is necessary, give a liberal shift, and keep rather close and moist, until the roots lay hold of the fresh soil; and as soon as this is observed to be the case cut the shoots back, removing any indications of bloom, and train them so as to induce the lower buds to start into growth. If all goes on well vigorous growth will soon commence; and if green-fly makes its appearance apply tobacco smoke. Until the plants can be shifted into their flowering pots, and a proper trellis used, the shoots should be trained to stakes. In May remove the specimens to a cold frame, and treat them during the season as recommended for last, only that air may be given more freely, and on mild settled nights the lights may be left off altogether, so as to give the plants the benefit of the night dews. With ordinary management good sized specimens in 9-inch pots will be obtained by the end of the season, and these may be allowed to bloom the following summer, or cut back sufficiently to remove the flower, and repot in good sized pots, say 13-inch, which will be sufficiently large to produce fine bushes. Water must be applied very cautiously after giving a large shift, and the atmosphere kept rather close and moist, to induce the roots to strike into the fresh soil. Apply the trellis on which the plants are to bloom directly after potting, and train the shoots to it, taking care to get the lower part well furnished first. Keep the plants clear of insects, and properly supplied with water, and afford them a cool airy position as soon as they have got hold of the fresh soil, and they will make very rapid progress, and by giving a small shift about every other year, they will bloom finely in the greenhouse or conservatory for many summers.

For soil use rich turfy peat carefully broken up into small pieces, and well intermixed with about one-fourth its bulk of sharp silver sand. The addition of a small portion of sandy turfy loam will be advisable in the case of having to use poor sandy peat. *Alpha.*

* Dr. Hooker has very lately shown me facts which seem to prove the continuity of the vascular system between the matrix and certain parasitic plants. The analogy above mentioned may be illustrated by the notion expressed by the late Mr. Newport, in a memoir in the Linnean Transactions, vol. 20, p. 346. "The larva of Ichneumon atropos, in which I have found that there certainly is no outlet to the alimentary canal, and which subsists on the adipose tissue and fluids of the caterpillar, has true but extremely minute spiracles and air vessels, and although completely inclosed in the body of the caterpillar, seems to respire the air directly, perhaps, from the injured air vessels of its victim."

HOW TO MEASURE TIMBER.

Easy as it is for those acquainted with the principles of mensuration to ascertain the cubic contents of timber, there are many persons who, not having had their attention particularly drawn to such matters, are at a loss how to set about the operation, and who yet occasionally wish to perform it. The following rules may be of use to such persons.

The precise form of the trunk of a tree, when felled, lopped, and cut fit for squaring is that of a right cone; but the cone becomes more or less like a cylinder, according as the difference between the diameters of the two ends of the tree is small or great. Before measuring a tree it is necessary to determine whether it shall be treated as a truncated cone or as a cylinder; hence there are two cases to be considered.

I. If the trunk is taken as a cone, the following formula must be used:—

Let R = the radius of the large end of the tree
R′ = the radius of the small end of the tree
L = the length of the trunk to be measured.

Then the cubical contents of the tree are equal to

$$\tfrac{1}{3}\,3{\cdot}142\ L\ (R^2+R'^2+R\times R')$$

So that if the length be 9 feet, the diameter of the large end 3 feet, and its radius consequently 18 inches, and the diameter of the small end 2 feet 6 inches, and its radius consequently 15 inches, we have $\tfrac{1}{3}\,3.142\times 9\times(2.25+1.5625+1.5\times 1.25)$ which gives for the solid contents of the trunk 9.426×5.6875, or about 53½ cubic feet.

II. If the trunk is considered a cylinder, the best way to obtain its contents is to find by measurement its circumference half way between the two ends. If the length of this circumference be called C, the area of a section of the trunk where the circumference is measured will be $=\frac{C^2}{4\times 3.142}$, and the radius R at the same point will be $\frac{C}{2\times 3.142}$. If, then, L represent the length of the trunk as before, its cubical contents will be equal to $L\times\frac{C^2}{4\times 3.142}$.

or $L\times 3.142\ R^2$

So that if the length of a trunk be 9 feet, and its circumference at its middle be 6.482 feet, the radius will be $\frac{6.482}{2\times 3.142}$ or 1 foot, and the cubical contents of the trunk will be $9\times\frac{6.482^2}{4\times 3.142}$ or $9\times 3.142\times 1^2$, either of which gives about 28¾ cubic feet.

The number 3.142, it is hardly necessary to observe, is the length of the circumference of a circle whose diameter is 1.

If it be desired to make allowance for bark and sap wood, the radius R in the above formulæ may be diminished accordingly; or the whole contents of the trunk, including bark and sap wood, may be found as above, and some fractional part of the result be afterwards deducted. *Archon.*

Home Correspondence.

Late Spring Frosts.—I can fully confirm the statement of your correspondent "T. R.," as to the disastrous effects of late spring frosts upon the fruit blossoms in this county during the last 11 years. To begin with 1843.—During the first week in April the fruit-buds were considerably advanced by the frequent warm rains after a very dry March; but on the 8th and five consecutive mornings the thermometer registered as follows: 8th, 28°; 9th, 28°; 10th, 24°; 11th, 20°; 12th, 24°; 13th, 24°. These frosts proved more than sufficient to destroy all the Plums, Peaches, Cherries, and early Pears. The month of May was very cold, and much of the young fruit dropped from the trees. 1844.—April 9th, therm. 29°, and again on 28th, 29°; the latter frost severely injured the fruit blossom; again, so late as May 18th, the temperature fell to 27°, or 5° of frost. Fortunately the atmosphere was very dry at this period, in consequence of an unusual prevalence of N.E. winds, or the frost must have produced most disastrous effects. The crop this year was very deficient. 1845.—April 7th, therm. 26°, when the Plums and Cherries were much injured. On the 9th the maximum temperature in the shade was not more than 37°; but on 23d, 74°, so fickle is our climate. On May 6, therm. 30°, and placed on Grass it fell on 6th to 26°; 9th, 29°; 10th, 28°; 15th, 27°; 18th, 25°; 20th, 28°. The low mean temperature of this month was very unfavourable for the Apple bloom, the crop of which was very deficient. 1846.—On March 18th, 19th, 20th, 21st, and 30th, the temperature fell to 28°, 24°, 26°, 27°, 27° respectively; the greater part of the buds on wall trees was almost entirely destroyed. The later fruit was severely injured by frosts on the four last mornings of

April, when a thermometer on Grass fell to 26°, 29°, 26° and 25° respectively. The Hop plant was much injured at this time. 1847.—On the mornings of April 1st, 2d, and 3d, there were severe hoar frosts; and on 16th, 17th, 18th, 20th, 23d, and 28th, the temperature fell to 28°, 23°, 24°, 27°, 27°, and 28° respectively. All the Plums, Cherries, and Pears, were most severely injured. The Apple blossom was much destroyed by a frost on May 1st, thermometer 29°. 1848.—On April 27th the temperature fell to 29°, and on the Grass to 25°, just as all the fruit was in full blossom. The injury was the more severe in consequence of the bloom being very wet after the heavy showers on the previous day. 1849.—All the fruit blossom was severely injured by the frost on April 12th, 14th, 18th, and 21st, the temperature falling to 27°, 28°, 25°, and 28° respectively. A very heavy rain and snow (amounting to 1.40 inch in 24 hours) fell on 19th, rendering an early vegetation very sensitive to frost. 1850.—Only 1° of frost was registered in April, but on May 3d the temperature fell to 25°, and on the Grass to 21°, and the blossom of Plum, Cherry, and Pear, was almost entirely destroyed. 1851.—Slight frosts occurred on 26th, 27th, 28th, 29th, and 30th of April, but without doing much mischief, nevertheless the crop of Plums was very deficient. We had no frost on May 14th, as registered by "T. R.," and only 1° was observed throughout the month, which was on the 16th. 1852.—I registered 11° of frost on the morning of March 27th, which almost entirely destroyed the early wall fruit, and in some instances even the trees themselves died under the influence of the subsequent dry weather and hot sun of April. There were frosts, more or less, on 11 days in April; but on 10th, 20th, 21st, and 28th, the temperature fell to 28°, 24°, 26°, and 27° respectively, which did immense mischief to all the fruit blossom. The Apple bloom was much injured by a frost on May 3d, when the temperature fell to 28°, and on the Grass to 22°. 1853.—On March 25th, 26th, and 27th, the temperature fell to 21°, 24°, and 19° respectively, and severely injured the advancing blossom of the Cherry, Pear, and Plum. The Apple-blossom was again injured by frosts on the mornings of April 27th and May 9th, when the temperature fell to 28°. 1854.—With respect to the current season, although the nights have been cold and dry throughout the months of March and April, the frosts have been slight. On April 4th, thermometer 27° ; 5th, 29° ; and on the morning of 25th ult., there were only 28°, or 4° of frost; when at Chiswick, 14° of frost were registered, and the fruit entirely destroyed. In some low grounds in this locality the blossom is slightly injured; but on more elevated spots the frost was scarcely felt, and the trees promise a most abundant crop. In some gardens, the Gooseberry trees are dreadfully infested with caterpillars. *C. Leeson Prince, Uckfield, Sussex.*——On the 24th ult., at 6 A.M., thermometer 33° ; on the 25th, 30°, but not lower. Ribes sanguineum, flowers then declining; Magnolia purpurea, budding out; common Hydrangea, buds burst; Moutans, sprouted 6 inches, and preparing to flower ; flower bunches of Wistaria, some opened ; Walnut trees bursting bud; Sophora japonica, budding; Laurus Sassafras, budding; Platanus orientalis, budding ; Deodars, buds burst ; Abies Brunoniana, budding ; Abies Webbiana, Pindrow, and morinda, budding; Fitz-Roya patagonica, budding; Saxe-Gothæa budding ; Libocedrus chilensis, budding ;—all unhurt. Taxodium sempervirens, Cryptomerias, Pinus insignis, Hartwegi, Montezumæ; Picea ovata, grandis ; Abies Jesoensis, Cupressus macrocarpa, and hibernica, Arbutus procera, Camellias in shade, Chamærops excelsa, and Aucubas, all quite unhurt. Camellia abroad does not bear the hot sun of spring. Araucaria imbricata is always growing summer and winter, though faster in summer, and never has had a leaf injured here by any frost. I need not speak of Abies Pinsapo and cephalonica, Pinus excelsa of Nepaul, or Pichta ; they never suffer here in any winter. Arbutus Unedo has lost its flowers and fruit ; Laurustinus, both kinds are tarnished. Bays yellowed a little by sun. Moutan rosea has just opened a flower ; foliage of our three Moutans—common, papaveracea, and rosea—quite uninjured this spring. Apricots, a most abundant crop on walls ; standard Greengage now white with flower ; Olive of Nikita, shoots of last year killed. *Charles Monck, Belsay, May 7.*—— The frost on the night of the 24th, and the morning of the 25th ult., has done much damage here to Apples, Pears, Plums, Cherries, Figs, Walnuts, Gooseberries, Currants, and Potatoes ; I do not think that the wall-fruit has suffered much, or I cannot yet see that it has. Azaleas suffered much ; likewise Magnolias, Paulownia imperialis, Abies Webbiana, Smithiana, and cephalonica, and Taxodium sempervirens, have suffered in the spring shoots of this year ; the Bamboo is doing well. The only plants of importance that suffered from the frost in January were Cupressus Uhdeana and torulosa. On the night of April 24th we had 9° of frost. This week we have had some fine rain, with thunder and hail. This morning (May 5th), between 9 and 10 o'clock, we had a tremendous hail-storm, with thunder, for about half an hour ; the hail measured more than 1¾ inch round one way, and 2½ inches the other ; in form it resembled a boy's peg-top ; it has done much damage—the leaves and young shoots of the trees and plants being completely riddled, and the ground beneath nearly covered with the ruin. I never saw such destruction. *Charles Elworthy, Gardener, Nettlecombe, Somerset.*

Bees.—Will some of your bee-keeping readers afford me information as to what may be the cause of a difficulty I have found in raising a queen by the transformation of the larvæ of the workers. I have by this means, at various times, supplied a vacant throne, but I find the practice cannot be relied on with certainty. In the present instance I have twice presented comb containing the larvæ and eggs of workers to a queenless stock, and each time the brood has been hatched, but no attempt has been made to raise a queen. On a previous occasion, in summer, the bees refused the first time, but immediately constructed royal cells on a second piece of comb. An instance of similar indifference is related by Dr. Bevan in the "Honey Bee." It cannot be supposed that the community is unconscious of its loss, as the dead queen was brought out under great excitement, and on the hive being opened immediately afterwards nearly the whole population was on the wing. It seems one of those cases which would teach us that the proceedings of these small people are not always to be bound down by laws of instinct, though the reason which guides them may not be apparent. As it is, the extinction of the family must soon take place. I should be much obliged for any suggestions which may enable me to save the hive, whose small population can scarcely linger out till swarming time, and singularly enough there have been drones in an adjoining hive since the beginning of March. *C. H.*

Sulphur a Preventive of Potato Disease.—Permit me to mention a fact in corroboration of the statement made at p. 290 of your last week's Paper. At the small harbour of Axmouth is a kiln for burning the blue lias for lime ; the vapour from it is very strongly impregnated with sulphur. Near this kiln is a house in which a cargo of Potatoes had been stored ; several diseased ones had been thrown out ; the man who burns the lime planted them on a rough piece of ground, over which the sulphuric vapour was continually passing. The Potatoes suffered to a great extent all round this neighbourhood, and the few near the lime-kiln were forgotten, when, about the end of November, a stray donkey, seeing something very green, and not being over nice, began to brouse on the stalks, in doing which he dragged up some Potatoes ; the yield was very large, and not a diseased one was found. The Potatoes were not planted till the end of March. *Thomas Sibbeld, Axmouth.*

New Materials for the Manufacture of Paper.—Would not the fibre from the stem of the Jerusalem Artichoke prove a good material for paper ? In this would be combined strength and length of fibre; and the root, which is too much neglected, would of itself pay for growing, and requires little trouble. *Tonbridgensis.*—— Would it be worth while to collect Pea-shells for materials for paper-making ? What thousands of bushels are thrown to the dust-bin in towns ! and when given to pigs they chew the shells, but do not swallow the inside tough fibrous part of the shell. Would not also the stripped bark of Osier rods do for paper material ? I think both of these properly prepared and bleached would answer for fine writing-paper, especially the fibre of Pea-shells for perhaps bank post-paper. There is a sort of indigenous Grass (Crested Dog's-tail), which sown or transplanted on rich ground, or ground made rich as a market-garden, would grow straws 4 feet in height, and if cut before past bloom, would not have its outside very silicious ; as far as I have observed, it is the toughest indigenous Grass and full of fibre ; and this, too, could be properly prepared and bleached, and would probably make fine paper. Suppose that an acre would produce 2 or 2½ tons of dry Grass, and that to produce only three-quarters of a ton of material. I also suppose that three-quarters of a ton would be of equal value to the best rags. Probably a great part of the toughness of paper is owing to the quality of the size or gelatine or glutinous material used with the prepared pulp. *J. C. X., Weybridge, Surrey.*—— There are many coarse weeds which might probably be rendered useful for paper making, if some easy mode of giving them a saleable value were generally circulated. If thrown in heaps they would speedily ferment, so as to destroy the tenacity of their fibres. The first requisite, therefore, towards giving them a value, is the general dissemination of instructions for so storing or preparing them as to be fitted for the market. I may instance as examples of such weeds, not only the Nettle, but Hemlock, which is so great a pest in many meadows, whence at the mowing season it has to be separated from the hay, which it would otherwise cause to heat or ferment injuriously, from the slow drying of its coarse stalks. The coarse yellow Rag-weed, which infests the fallow fields of Ireland, is another example. Thousands of tons of this vile weed—the disgrace of Irish farming—might be collected and it would probably supply a fitting material, if the cottiers were directed how to make it available. *P. S.* [In this and all such cases the persons interested in utilising such materials should render a sample marketable, and then ascertain its value.]——It is not probable that refuse bark from tan-pits would answer for paper making, the fibre being very coarse in quality, and not white enough. The inner bark from Larch, Spruce Fir, Scotch Pine, Elm, and some other kinds of wood, are capable of being reduced to a mass of very fine fibre. I have tried what sort of fibre the common Bramble (Rubus fruticosus) would produce, by pounding it in a stone trough with a large wooden pestle ; it furnished about 30 per cent. of fibre, but it was of very coarse quality. My experiment, however, might have been imperfect. *A. Patterson.*——Would not the refuse of the Irish scutching mills answer for paper making ? An acre of Flax yields, on the average, about 15 cwt. of this refuse, of which, at least 3 cwt. would contain enough of fibre to give it the requisite coherence. At present, it is used as fuel where peat is scarce, and thrown in the river where it is plenty. We grow about 140,000 acres of Flax in Ireland annually, and have waste water-power in abundance. Indeed, the very mills which make the refuse are, for the most part, only worked during five or six months in the year ; and during the remainder their water-power might be profitably employed in making paper. *W. S.*

The Forest of Dean.—You assumed in your reply to my last letter that I had not read the evidence collected by Lord Duncan's committee. It was rather a bold assumption. You speak next of the vast sum laid out on the Forest of Dean, and the returns made at the period of 1848, which, pardon me, proves to my mind more convincingly than ever, that you have lashed the forest on *ex parte* statements alone, without that just knowledge of the whole subject which one ought to look to, and which I wish to look to, in a publication like the *Gardeners' Chronicle*. I hear to-day that Mr. Machen has been requested to resume office, by the Treasury, for a few weeks, until a successor be appointed, which he has done. They decline to trust Mr. Brown any longer. Indeed, one of his statements has been found so utterly wrong that he could not be allowed to retain his situation, and an order was sent to Mr. Kennedy from the Treasury to dismiss him. That has been done ; and I hear, also, to-day, that Mr. Kennedy himself has resigned. I hope, in candour and honesty, that you will admit that, as far as the Forest of Dean is concerned, you have been misinformed, or informed below the mark ; and that, with the freeness of a gentleman's mind, you will allow it without reserve. Twenty years hence will prove that forest to be the most productive in the kingdom. The truth is, that Mr. Kennedy came red-hot with the Scotch system to "boulverse" the forest. There have been other systems in former times—the Duke of Portland's system amongst the rest. One system was to let all the trees fight it out amongst themselves, and cut down all but the toppers. Mr. Kennedy's first plan was to employ men to cut down all the brush-wood, and clean the stems of all the trees, on about 15,000 acres of unproductive Oak ; *i.e.* wood from 15 to 25 years' growth. I have no doubt you can count the cost of that labour. I have nothing to do with other forests ; but the Forest of Dean, in my opinion, has not had justice from you. Σοφ, *May 4.*

Effects of the Winter and of the Frost on the 24th ult. at Bayfordbury.—It is scarcely yet possible to ascertain the full effect of the late severe winter on many of our recently introduced Conifers, as, for instance, in P. patula, a fine specimen of which I had hoped was but comparatively little injured—its branches appeared healthy, and the young shoots were pushing freely—but on examining the stem I found it completely dead, and black in the inner bark down to the very root. The same thing occurred in 1844, and my present specimen is actually a graft taken from the former tree in the same state as the one I now describe, and from which I have now again taken grafts. P. Teocote presents nearly the same appearance, but I do not find that the main stems of the other Mexican Pines are injured in the same way, except in P. Hartwegi and macrophylla, which are both killed. P. apulcensis, and a fine unknown species from Mexico of 15 years' growth, are much injured ; P. Russelliana is only brown in the points of the leaves ; P. muricata, tuberculata, Benthamiana, Lindleyana, and Montezumæ are quite uninjured ; P. Lindleyana may perhaps be considered the handsomest and hardiest of all our new Conifers. I have never seen it damaged by wind or frost. All the other Pines have escaped unhurt, including P. insignis, Gerardiana, palustris, &c. ; all the above stand much exposed, and are never protected. The young wood of some of the Pines has, I fear, suffered from the late spring frost of the 24th ult., of which there is no doubt in the case of P. excelsa, and others of the Strobus family. Most of the Abies and Deodars, which had stood the winter unhurt, are injured from the same cause, including A. Brunoniana, Cryptomeria japonica, and Taxodium sempervirens, which have the young shoots cut, especially the former; the latter is pushing through the apparently injured buds. All Cupressus are more or less damaged, and some are killed, as C. Uhdeana, thurifera, and Mexicana. The two which are the handsomest, and most hardy (and of which I should be obliged for further information as regards their history, &c.) are C. Knighti and majestica; these have stood in a very exposed situation, and are very slightly injured. Junipers are not much damaged, with the exception of J. Gossainthania and Bedfordiana. Araucaria imbricata is also unhurt by the winter. I take this opportunity of mentioning a singular circumstance which occurred to the Cedars of Lebanon here during the last summer, and I should be glad to know if the same has been noticed elsewhere. The Cedars to which I allude are very fine trees, nearly 100 years old, with others of a younger growth, some of each of which were suddenly struck by some cause, either of blight or atmosphere, which gave them the appearance of being singed ; very soon after which those which were so affected either partially or wholly lost their leaves, and were to all appearance dead. Two have since died, but the others are now putting out new shoots and seem likely to recover. Some Scotch Firs in the park were also affected in the same way. These trees were in different situations and in some cases at the distance of half a mile from each other, whilst in

other instances of two trees similarly situated, and close to each other, the one was struck and the other remained perfectly healthy. The Cedars of Lebanon here seem also to have felt the effects of the winter more than the Deodar, as upon the breaking up of the frost the green leaves of the former came off in such quantities as completely to cover the ground for a considerable distance, leaving some of the trees half bare; they are now, however, breaking out again freely, and the young growth of the Cedar of Lebanon is uninjured by the spring frost, whilst the Deodar suffered from that cause most severely. The effects of this frost upon other trees and plants seem to be much the same here as has been noticed in many other places. Among the forest trees the Oaks, Walnuts, and Spanish Chestnuts have suffered the most; the Beeches are scarcely damaged in any instance, and are getting into leaf with full vigour. *W. R. Baker, Bayfordbury, May* 8.

Funckia grandiflora.—The case of this plant is a curious one. Your remarks made on September 24th, 1853, do not meet its difficulties. The strange havoc made of its foliage evidently arises from some animal with appropriate mandibles. But it proceeds from an animal unseen by any eye, from morn till dewy eve. The invisibility of the enemy is the mystery. Therefore it can hardly be "some caterpillar" in the popular sense of the term. My only conjecture is that the leaves are devoured by some larva that rises from out of the earth at a later hour of the night than my observations have extended to, and who vanishes at cock-crow. I have spread a layer of soot round the plants, thinking the animal might dislike to pass through it. As yet nothing but the late frosts has meddled with the foliage. I should be glad to learn what is observed of this plant elsewhere. *A. H.*

Royal Horticultural Society of Ireland: Value of Horticultural Knowledge in Irish Improvements.—It is now nearly five-and-thirty years since I commenced the study of horticulture, practically and scientifically, in my native county, called "the model county," of Wexford. It is bordering on 30 years since I first went to Dublin to study my profession in the high spheres. Though very young then, and inexperienced in the world, I soon saw that the Royal Horticultural Society of Ireland, then some 10 or 15 years in existence, needed reformation. Having made the acquaintance of the then president and principal members of the managing committee, I suggested to them the idea of opening their "close borough" to all men of merit on a "clear stage and no favour," without distinction of county or creed. This, through some notions of selfishness or false aristocratic pride, they refused to do. Knowing the value of "legitimate agitation" and of "passive resistance," I began both, and without much personal influence or a name, and without the aid of the press—we then had neither horticultural nor agricultural press in Ireland. A few years brought on the first dawn of reform in their mode of procedure; and step by step, year after year, reforms of a salutary kind have crept in, and the Society is now, I am happy to say, as far advanced towards perfection as the most sanguine of its supporters could be led to expect under the trying circumstances of this (for horticultural as well as agricultural purposes), fine but ill-fated country. During the late "visitation," it was believed by many that the higher branches of horticulture would suffer more by the famine than would be suffered by agriculture in the rude operations of the farm. Such belief has unfortunately been but too well founded, as we now see in many places the once fine gardens and parterres converted into calf paddocks and sheep pastures, the conservatories into poultry-houses, the Pine stoves into piggeries, and the mansion houses into pauper bastiles. But as good sometimes comes out of evil—the evil should not be committed with the view of extracting good out of it—the evil just hinted at has had its corresponding advantages. Thus, the men who superintended and studied their professions in such places, were the men who have made the first advances, aye, and through the agency of the Royal Horticultural Society too, towards the preservation of the people's lives, and have proved themselves the most successful farm crop growers and general land improvers—of which more hereafter. Despite the ravages of the famine, the evils of emigration, or the preponderating influence of the Encumbered Estates Court, horticulture not only holds its place, but, to a certain extent, improves to a high degree in Ireland, as evidenced by the productions and attendance at the Royal Horticultural Society's spring exhibition, in the Rotunda, Dublin, on the 27th ult., where I had the pleasure of seeing the best plants and flowers in their respective classes I have ever seen before during my 30 years' acquaintance with its exhibitions. The vegetables were also exceedingly fine, considering the unfavourable season for their growth, through which we have passed. Fruits, it is to be regretted, were not very abundant, except in the case of Apples, and these were very fine. There was but one dish of Pears, which were good of their kinds; one Pine, a very good one; two bunches only of Grapes, and one of these scarcely ripe. This paucity of fruits was owing to some of the causes already alluded to. I observed a fine collection of forced Strawberries, things rather unusual on such occasions in Ireland. They were very fine in appearance, but the very best were badly flavoured. On the whole, the exhibition reflected credit on the Society for its arrangements, and on the exhibitors generally for their productions. It is also gratifying to state that there was a good attendance, notwithstanding the unfavourable aspect of the morning. My object in noticing this exhibition is less with the view of complimenting those who act for and support it than of stimulating others, who may be careless or apathetic in such matters, to "go and do likewise." Horticulture, as is well known to those who have studied and understand it, has been the parent, and is the sponsor and nurse, of improved agriculture, now more than ever the mainstay of Ireland. To the Royal Horticultural Society do we owe the first successful display of these monster green crops, now the admiration of the agricultural world. To it are we indebted for the first display of our natural as well as artificial Grasses and other cereals, for the growth of which Ireland has of late become so conspicuous. To the horticulturist do we owe the first successful attempts at reclaiming the deep bog, the *perished* moorland, and mountain heaths of Ireland. To the horticulturist do we owe our improved system of drill cropping and seed sowing. To the horticulturist do we owe the most successful methods of draining our wet soils and deepening our shallow ones. To the horticulturist do we owe the judicious, cheap, and economical application of liquid manures, the compounding of artificial, the preservation of home-made, and encouragement of foreign ones. To the horticulturist do we owe the beautifying of our landscape, the sheltering of our hills and homesteads, as well as the vast profits now derived in Ireland from the sale of timber for railway purposes, not alone in Ireland, but in many other parts of her Majesty's dominions, as evidenced by our export trade in this particular, and above all, and before all, to the horticulturist do we owe the judicious training of our skilled labourers, so as to enable them to give "a fair day's work for a fair day's wages;" for skilled labour, no matter what the price, is, after all, the cheapest, whether "man earns his bread by the sweat of his brow" or his brains. Is it, therefore, too much for me to beg of your readers in this country to rally round and support the Royal Horticultural Society of Ireland, both with their money and mind, in order to enable its directors to carry out their contemplated objects, namely, to increase the wealth and luxuries of the affluent, and to increase the food of the pauper by enabling him to support himself. *Edward Carrol, Clare Hotel, Limerick.*

Societies.

Entomological, *May* 1.—H. T. Stainton, Esq., V.P., in the chair. Amongst the donations to the library received since the last meeting were various publications presented by the Royal Society, the Society of Arts, the Philosophical Society of Liverpool, and Messrs. Guérin-Meneville, Th. Lacordaire, Duval, and Migneau. The Rev. Jos. Greene exhibited specimens of the rare Notodonta cucullina and N. trepida, both recently reared from the caterpillar; Mr. Edwin Shepherd, beautiful specimens of Ephyra pictaria, recently reared from the larvæ; and Mr. F. Bond, some curious specimens of Anticlea berberata, also reared from the larvæ, the fore wings on each side differing in their markings. Mr. Douglas exhibited the larvæ of two species of Elachista, found burrowing in the leaves of Poa aquatica and a species of Reed. Mr. S. Stevens exhibited specimens of Notodonta Dictæoides and Carmelita, the latter being a female still alive and laying her eggs; also specimens of the curious beetle Hyloœcetus dermestoides in all its stages, all from Sherwood forest. Mr. Curtis communicated a list of rare insects captured in 1852 at Tunbridge Wells and Dover. Mr. Stainton communicated some notes on the larvæ of various Microlepidoptera. A conversation ensued on the increasing difficulties experienced by collectors of insects near London, owing to the encroachment of landed proprietors on the old public footpaths. The Secretary announced that the council had resolved to co-operate with and aid Prof. Edward Solly in the formation of the trade museum of the Society of Arts, on which he is now occupied, in matters connected with insects and insect produce (as silks, honey, wax, &c.); and that any duplicates of injurious or beneficial insects in the Society's collection should be presented thereto.

Reviews.

The Commercial Products of the Vegetable Kingdom. By P. L. Simmonds. 8vo, Day, pp. 668.

Had this important volume been more to our taste, it would have been less suited to the class of readers for which it is intended. We regard its diffuseness and want of condensation as a fault; but experience tells us that by "colonists, manufacturers, merchants, and consumers," for whose information it is written, it will be prized the more, because of its repetition of minute details. The object of the author is to afford information respecting tropical and sub-tropical husbandry; and he has gathered that information from all sorts of sources. The consequence is, that his volume has the faults and merits of a Blue Book. Nobody would think of reading it; but many will consult it when in search of the kind of knowledge it contains.

Hitherto, a very indifferent book, called "Porter's Tropical Agriculturist," has been the only accessible authority upon the details of colonial husbandry, a circumstance not particularly creditable to a nation of colonists, as the United Kingdom may well be called. It would be most unjust to Mr. Simmonds not to declare at once that he has entirely superseded his predecessor, both in the quality, quantity, and variety of his information, to say nothing of the abundant statistical details which have been diligently collected in the work before us, and which are extremely valuable. The statistics of Wheat culture alone occupy nearly 40 closely printed pages.

Two faults, however, though of very different importance, require to be pointed out. The lesser includes the botanical inaccuracies which disfigure the pages; the greater is the surprising circumstance that in a volume on tropical agriculture there is not one word about textile materials. Cotton, with all its kindred imports, is entirely forgotten! As is, also, the numerous race of timber trees! We should have hoped to find some account of, at least, Mahogany, Sabicu, Rosewood, and Teak.

On the Rust of Corn and other Agricultural Plants, and its consequent Diseases.—(*Untersuchungen über die Brandpilze und die durch sie verursachten Krankheiten der Pflanzen mit Rücksicht auf das Getreide und andere Nutzpflanzen.*) Von A. de Bary, M.D. 8vo, pp. viii. and 144; tab. lith. 8. Berlin, 1853.

It was matter of considerable regret that when Léveillé published his excellent paper on the generic characters of Uredines, he did not illustrate his precise meaning in some points of minute structure by clear and definite figures. Many useful and distinctive facts are indicated in the paper, but we have never been able to verify what he says of the structure of the receptacle in some genera, nor of the mode of origination of the spores, partly perhaps from not perfectly understanding his precise meaning. The work of M. de Bary, now before us, who happily did not write in ignorance of Léveillé's paper, after the example of too many of his countrymen in similar matters, has in some measure supplied the deficiency to which we have alluded, but he no more than ourselves has succeeded in verifying all the observations of Léveillé, and figures illustrative of most of the genera proposed by Léveillé, will shortly appear in the article Uredineæ, of the "Encyclopædia of Agriculture." Those who are interested in the subject of epiphyllous parasites will find much in this unpretending volume to instruct them, and the more so, because M. de Bary has followed out the example set by M. Tulasne, of referring to their proper place, as secondary forms of fruit, many epiphyllous productions which have been published by authors as autonomous species, though not indeed as matters of novelty, of which there could be no pretension, for the subject was perfectly within the cognisance of many mycologists, and only waiting for some one who had the necessary leisure to follow it out. Of the correctness of the author, a singular instance occurred almost on the very day in which we received the volume. A species of *Lecythea*, without name, was figured as produced on a species of Grass, almost the last place in which the presence of the genus could be suspected, but the next morning's post brought specimens of something new on *Brachypodium pinnatum*, discovered in Warwickshire by Mr. Bloxam, a glance at which was sufficient to show that it was M. de Bary's unnamed Lecythea, which now is registered as *L. Baryi*. This little volume, which bears a very reasonable price, should certainly be in the hands of everyone who wishes to understand accurately the structure of these productions—a matter, as we can speak from personal experience, attended with far greater difficulty, because of the greater dexterity requisite to make sections sufficiently thin for the microscope, than might at first sight be supposed, and without such sections it is quite impossible to arrive at anything certain; nor is this the only difficulty, for if the section be sufficiently delicate, it is a thousand chances to one if the spores remain perfectly undisturbed.

New Plants.

62. Gonolobus pyrrhotrichus. *Decaisne in Decand. Prodr.* VIII. 594.

A fine specimen of this striking plant has flowered with Messrs. Weeks and Co., of the King's Road, Chelsea. It is a coarse climber, all covered with long shaggy tawny hair. The leaves are dark green, 6—7 inches long, cordate at the base. The flowers appear in shaggy umbels on pedicels 2½ inches long. They are 1½ inch in diameter, dull green, with obscure netting, and five bright yellow 3-lobed coronal teeth. The plant is Brazilian and requires a stove. Messrs. Weeks received it under the name of Gonolobus crispiflorus, which is quite a different species.

63. Aphelandras quarrosa Leopoldi, *Van Houtte.*

A year or two ago Mr. Van Houtte sent to our exhibitions a very handsome stove shrub, whose deep green polished opposite leaves, marked with well defined broad whitish veins, attracted much attention. We have now before us a coloured plate of this plant in blossom, from which we learn that the flowers are bright yellow, as large as those of Aphelandra cristata, and seated in broad greenish-yellow crimped bracts, so as to form a bright yellow cone, of considerable beauty. It appears to be a vigorous grower, and to be a real acquisition, not only because of its fine variegated leaves but its noble showy inflorescence. We understand that the stock of the plant is in the possession of Messrs. Veitch & Son.

Garden Memoranda.

Mr. Groom's Tulips.—These are just now in perfection, and we can promise our readers that a sight of them will amply repay a visit. The best bed, 120 feet long, and containing not less than 2000 flowers, is as fine as we have ever seen it. We observed the following favourite sorts in good condition, viz.:—Byblœmens.—Victoria Regina, Addison, Captain Cook, Roi de Siam, and Violet Alexander. Roses.—Duchess of Sutherland, Countess of Wilton, Fleur de Marie, Michael Angelo, Claudiana, and Catalani. Bizarres.—Duke of Devonshire, Marshal Soult, Polyphemus, William the Fourth, Prince of the Netherlands, Catafalque, Dr. Horner, and Prince of Wales. Among novelties were Miss E. Seymour, a good rose; Themis, a byblœmen; and Mr. F. Perkins, Duke of Wellington, and Marquess of Bristol, bizarres. Of these and a few others we hope to give some account hereafter. The beds in the open ground are now at their best, and being spread over a large surface of ground they make a fine display. They have not been injured in the least by frost, and of failures there are scarcely any. A fine bed of Rose Eclatante, a deep red double kind and scented, was especially remarkable; this is a sort which should not be lost sight of by growers of early Tulips.

FLORICULTURE.

Scarlet Pelargoniums.—If brilliancy of colour, free blooming, and compactness of growth are desirable, then scarlet Pelargoniums deserve a prominent position in every collection of soft-wooded plants. I will, however, at present confine my remarks to the variety called Tom Thumb. In order to secure good specimens of this, about the middle of March cuttings should be taken off any old plants you may happen to have. In choosing cuttings, secure the strongest, cutting them close to a joint, then insert them in a light compost of sand and leaf soil, giving them a liberal watering with a fine watering-pot, so as not to disturb the soil round the neck of the cutting. The pot may now be plunged in the propagating pit, where there is a brisk moist bottom heat; if all goes well, in four weeks they will be sufficiently rooted to bear potting off singly in 4-inch pots, in a fine sifted compost of maiden loam, leaf soil, and sand. This should be done carefully, so as not to bruise and injure any of the young tender roots, for if these are

injured it retards the growth of the plant greatly, and is a great drawback to its future well being. They may be again plunged where they were struck, for four or five days, which will enable them to make a start. They may then be taken to a warm Vinery, and kept as near the glass as possible, where they will soon push away strongly. When once it is found that the pots are full of roots, give a shift into a 6-inch pot, using a good rich compost of two-thirds turfy loam and one-third decomposed cow droppings and sand, well intermixed; this shift will be sufficient for them this season. They may be kept in a cool house during winter till about the middle of February, when they should be potted into 10-inch pots, in which they should be bloomed. The soil which I find best for this shift is two-thirds rich fibry loam, one-third rotten cow-dung, and a little sandy peat and river sand; after potting, tie the shoots close down to the rim of the pot, as regularly as possible all round, so as to balance the plant; cut the ends off the shoots, and fasten them down to the rim of the pot; this will make them break out at all the joints. They may now be placed where there is a temperature of from 55° during night to 60° in the day-time. Here they will soon show symptoms of growth. As they progress, keep the outside shoots tied close down to the level of the rim of the pot, letting the rest rise gradually, so as to form a good shaped plant. All that is now required is regulating the shoots and syringing over-head occasionally till the latter end of June, when they should be removed to a cold pit or frame, admitting as much air as possible. The flowers should be all picked off till the middle of July, when the plants may then be permitted to flower. By the second week in August they may be removed to the plant house, where they will become objects of admiration, and will remain for at least two months in the highest possible perfection. They will be much benefited by watering twice a week with liquid manure. *W. F.*

Fancy Pelargoniums.—These are almost without exception regarded as pot-plants only, and treated as such; planting them in the open ground is very seldom thought of, much less using them largely as bedding plants. The scarlet and variegated sorts, it need scarcely be observed, are necessary to every flower-garden; but the more beautiful fancy kinds, except one or two varieties, are but rarely indulged with a place there. It is the more remarkable that this is the case, when it is remembered how exquisitely beautiful they become, in good hands, when grown in pots under glass. It might be thought, if they only succeeded proportionately well in the open ground, which they will do, that they merit a trial there, at least; and the fact is, it is the want of this trial, in the majority of cases, that prevents their admittance to the flower garden. At Trentham, however, and a few other places, the fancy varieties are placed on the same footing as the scarlet, variegated, and Ivy-leaved kinds, and the effect the whole creates is such as to render the site they occupy the most attractive feature in the grounds. If, then, by dealing with fancy Pelargoniums as with other flower-garden plants, they can be made equally useful, what might not be done with them if the same principle were carried out in preparing plants for turning into the open ground that produces such gratifying results with those cultivated in pots? The fancy Pelargonium grows exceedingly rank when planted in rich flower-garden soil, branching very strongly, and bearing leaves twice their usual size; but few flowers, and those few neither of the proper size, shape, nor colour. Providing soil meagre in quality and quantity in which to grow them is, therefore, required to bring about the desired result; if, in conjunction with its provision, aged plants were also employed, the end in view will be more effectually gained. This last precaution would of itself suffice, and better effect the object than almost any combination of measures. Every one is familiar with the practice of lifting scarlet Pelargoniums year after year from the open garden because they are more serviceable for future use than young plants, by bearing flowers instead of growing exuberantly; and what is successful in their case, is assuredly equally so in regard to the fancy kinds. As the planting season is at hand I would commend these observations on this popular flower to the attention of your readers, trusting that many of them will give the plant a trial in the way I have mentioned. The kinds I have found to succeed the best are Anais, Queen Victoria, Hero of Surrey, and Defiance. *A.*

SEEDLINGS.

Azaleas: *T M.* A pretty variety, well worth taking care of.—*J H.* Greatly injured by travelling; can you furnish us with another bloom?—*A S Y.* Too much spoiled for us to offer any opinion on them.

Cinerarias: *R M.* Not so good as many now in cultivation.

Gloxinias: *J D.* No improvement on kinds we already have.

Heaths: *J H.* Very pretty, but not distinct enough.

Pelargoniums: *R J L.* Good in colour and shape, but too small.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Although a slight shade is indispensable on the forenoons of bright warm days, this must be used sparingly when the weather proves unsettled; for, without abundance of light, flowers never colour properly, and they soon fade if kept in too shady a position. Air should also be admitted freely whenever the weather will admit. Where it can be accomplished, watering should be done in the morning, in order to get the superfluous moisture dried up before evening, so as to avoid night damps, from which there is some danger during the present state of the weather. The New Holland twiners, when done flowering, should have their shoots well trimmed in before growth commences, thinning the main branches where necessary by cutting out weakly ones, always having an eye to secure plenty of young wood towards the bottom. If the plants are at all infested with scale, they will be most conveniently cleaned, and, where necessary, the paint washed, &c., immediately after pruning, so as to have all clean before the plants start into growth.

FORCING DEPARTMENT.

Pinery.—For plants intended for winter fruiting, we would recommend using a somewhat lighter soil than is generally employed for Pines, as there will not be so much danger of over-watering in this as when strong tenacious loam is used. We prefer a compost consisting of two-thirds mellow turfy loam with one-third of turfy peat, to which we would add a liberal sprinkling of clean sharp sand and small charcoal, or crushed bones in preference, where they can be obtained. In this the plants will root vigorously, and they can be freely supplied with manure-water, without any danger of soddening the soil. But the great advantage of a light soil is that it soon parts with its moisture, and the plants are more easily managed in it in the way of getting them to show fruit at the proper time, and also to secure this of prime quality. Avoid a too liberal use of shading during unsettled weather, such as we have lately experienced. Vineries.—See that inside borders are properly supplied with water, giving sufficient quantities to thoroughly moisten the whole mass of soil. The Vine is a gross feeder, and absorbs vast quantities of water. Also give a liberal supply of manure water from the stable tank to Vines in pots swelling their fruit, first diluting it slightly with warm water to bring it to about the temperature of the house. Attend to the regulation of the growth, and timely thinning of the bunches and berries. Look sharply after spider, and use every means to keep clear of this pest. Melons.—Maintain a somewhat moist atmosphere to young plants until they are fairly started into growth, but plants in free growth must be kept cooler, so as to induce a stocky fruitful habit of growth. Those setting their fruit should be afforded a rather dry atmosphere, as the young fruit is apt not to swell, if the Vines are kept growing too rapidly. Be very careful that insects are not allowed to establish themselves on the foliage; for if this occurs there will be little prospect of a crop. Remove decaying leaves immediately they are perceived, and pay the utmost regard to cleanliness; also apply quicklime, if damp is perceived on the stems.

FLOWER GARDEN AND SHRUBBERIES.

Except in favoured localities, it will be unsafe to commence planting out the bedding stock until we experience a decided change of weather. Meantime get the plants nicely hardened off and arranged, so that when planting out is commenced, it can be done expeditiously. Also decide upon what is to occupy each bed, and have everything in readiness. Push forward late propagated stock, and endeavour to keep the whole healthy, and growing slowly in their pots. It is a common and very bad practice to allow bedding stock to remain in small pots, exposed to the sun and wind, and very scantily supplied with water, until they get almost dried up, and such plants are rightly considered to be hardened. They should be exposed to the weather as freely as circumstances will admit, but never to such an extent as to brown the foliage and dry up the tissues. Endeavour to get mowing and other work here in a forward state, so as to be able, when bedding out can be safely commenced, to command sufficient strength to properly care for the plants in the way of watering, protecting, &c., as may be necessary.

FLORISTS' FLOWERS.

Now will be the time for the amateur to make the necessary additions to his collections of Tulips; and we would advise all intending purchasers to visit various beds and select for themselves. It is a much more satisfactory plan than buying them in dry roots; for the Tulip is so sportive that a change of soil and situation will make them come in wholly a different character the succeeding season. Awnings must be put up, giving all the air possible at the sides to prevent their being drawn. Mark in the book all which are defective, particularly those having a stained base or stamens; an inferior form may be tolerated for a while, but impurity never. Plant out Dahlias, place their supports to them, mulch the surface of the ground, and water regularly when they require it. Hollyhocks, too, may be treated in the same manner. Old plants which are throwing up four or five stems should be reduced to two or three, and these should be nicely tied out to short stout stakes, so that each spike may stand free of its neighbour. Tie up Pinks, and remove the superfluous shoots. Part Polyanthuses, planting them in a very shady cool spot; where this is not to be had naturally, artificial shade must be made, as this is essential to their well doing.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Proceed with the disbudding of Peach and Apricot trees, leaving for the present, however, any shoot the leaves of which overhang and shelter fruit; but the points of such should be pinched out, in order to afford those intended to be left at the final disbudding every encouragement. It will also be necessary to go over Pear, Plum, and Cherry trees to remove gross shoots, and to stop those not wanted for laying in. This, repeated as may be necessary during, summer is greatly preferable to the old practice of allowing the shoots to remain upon the trees till midsummer, and then cutting them back to two or three eyes. This showery weather seems to be very favourable for the increase of insects, and nothing must be allowed to interfere with the destruction of these pests. Ground from which Broccoli and other winter greens have been cleared should be manured and trenched, or dug, as may be requisite, for the succeeding crop; or, if it is intended for Celery, the trenches should be got out at once, so as to be able to get a crop of Lettuce or Spinach between the trenches. See to getting Tomatoes prepared for planting out, also sweet Basil, &c., with ridge Cucumbers and Vegetable Marrows; also make a sowing of Sweet Basil, Marjoram, Savory, &c., on a light warm border; and get the early Celery prepared for planting out as speedily as possible, and attend to the plants for succession crops.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending May 11, 1854, as observed at the Horticultural Gardens.

May.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

May 5—Frosty; foggy; white clouds, with deep-blue intervals; very fine; clear.
— 6—Cloudy and fine; dense clouds; uniformly overcast.
— 7—Fine; rain; cloudy throughout.
— 8—Fine; rain; clear at night.
— 9—Showery; heavy thunder storms, especially between 5—6 P.M.
— 10—Cloudy; fine; heavy clouds; clear at night.
— 11—Uniformly overcast; cloudy; fine; clear; slight frost.

Mean temperature of the week, 3¼ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending May 20, 1854.

May.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 14	63.3	40.9	52.1	11	0.66 in	3	5	6	1	3	5	4	1
Mon. 15	64.7	40.7	52.7	7	0.41	2	7	2	2	8	4	2	1
Tues. 16	66.3	44.0	55.1	10	0.24	5	4	6	2	3	2	1	
Wed. 17	65.7	42.8	54.3	11	0.58	1	5	4	1	3	7	4	3
Thurs. 18	65.1	43.3	54.4	13	0.17	1	5	5	3	2	7	4	1
Friday 19	65.6	44.4	55.0	11	0.50	2	5	6	3	2	7	3	
Satur. 20	65.1	44.3	54.7	14	0.64	1	5	7	3	3	5	1	3

The highest temperature during the above period occurred on the 15th and 17th, 1833—therm. 86 deg.; and the lowest on the 15th, 1850—therm. 25 deg.

Notices to Correspondents.

Diseases: *M R.* The disease in your Passion-flowers is confined to the bark, but is so extensive as to make the death of the affected shoots inevitable. It would be worth your while to examine whether the diseased spots may not have arisen from the contact of the wire trellis. If such was the case, be so good as to write a line to that effect addressed—Rev. M. J. Berkeley, King's Cliff, Wansford; and at the same time inclose one or two specimens, for the case is very curious. At present there are not sufficient data to enable any one to form a correct opinion.—*P S.* Your Melons are affected with the same disease which was prevalent in Cucumbers in 1847, and of which you will find a detailed account, with figures, in our volume for 1847, p. 355. As a tendency to such diseases, in all probability, *exists already* in the seeds themselves in certain seasons, it is impossible always to guard against them, even by the best principles of cultivation; and in general they admit of little remedy when once established. The cold weather of the last five weeks has, however, been very unfavourable to both Melons and Cucumbers, as it has been almost impossible to give them as much air as they require. *M. J. B.*

Fungi: *C D.* The production on Pinus longifolia is Æcidium Pini, a fungus which is common on young plants of Scotch Fir, but which seldom does material injury, except it attacks the shoots themselves. It is impossible to guard against the attacks of so common a parasite in the first instance, because any breeze may introduce the spores, but where it breaks out it may be prudent to remove the affected plants; or, if they are not of considerable value, to destroy them altogether. The allied species, which attack Fir trees on the continent, are far more formidable enemies. *M. J. B.*

Highclere Castle: *A B.* We regret to say that the beauty of this fine place is very greatly impaired by the recent frosts, which have either destroyed or disfigured the magnificent American plants for which it is famous.

Manure for a newly-sown Lawn: *R V.* Soot is one of the best kinds of manure to use to encourage the growth of fine Grass. We hear sewage charcoal well spoken of, but have had no experience with it.

Names of Plants: *J A.* 1, Fumaria bulbosa; 2, Rhaphis flabelliformis; 3, Saxifraga Geum; 4, Sanguinaria canadensis.—*R C R.* Luzula sylvatica. No doubt the leaves contain good fibre, if it can be got out.—*R. Yates.* Cattleya intermedia.—*Erzeroum.* 649, Geranium ibericum; 648, G. sanguineum; 237, this Cicer seems to be C. songaricum, not arietinum.—*C L P.* Dendrobium aureum, the pale variety; Cyrtochilum hastatum, a variety of Gongora maculata, and what appears to be the small variety of Oncidium ampliatum.—*J R.* We cannot render you any assistance. What relation have Algæ to horticulture? *Boconnoc.* Prunus Padus, the common Bird Cherry.—*Diss.* 1, Doronicum Pardalianches; 2, D. plantagineum; 3, Cornus mascula; 4, Euonymus europæus.—*J. Weeks & Co.* We do not see how it differs from the common Dipteracanthus strictus.

Salsify: *Y H.* It is the roots (which are long, tapering, and fleshy) that are used. Wash them, and scrape the skin gently off them; cut them into lengths of 3 or 4 inches, put them into boiling water with a little salt, a small bit of butter, and a couple of spoonsful of white vinegar, or the juice of a lemon; boil them for an hour, then drain and serve with white sauce, rich brown gravy, or melted butter. Scorzonera is dressed in precisely the same manner.‡

Seeds: *J WH.* Cassia mimosoides is a well known plant, and your pods perhaps belong to it. This climate is, however, too cold for it in the open air.

Strawberries: *J P.* The leaf of your seedling, raised between Keens' Seedling and the British Queen, is broad and roundish, like that of Keens' Seedling. The fruit is large, roundish-ovate, flesh red next the outside, paler than that of Keens' Seedling at the core, and its quality is certainly good, even after enduring carriage. When fresh gathered it will probably be found excellent.‖

Timber Measuring: *T S.* As you seem not to understand this process, we have given you two methods, which you will find in another column. If you do not comprehend the rules there given, you must study arithmetic till you do. As to your question, we are wholly unable to comprehend what it means.

Weeds: *H A.* The best material to be used in a liquid state for killing Grass and Moss between pavement stones is corrosive sublimate dissolved in water.‡

Woods and Forests: *Quercus.* The Blue Book is entitled "Return — Royal Forests, H, C. No. 93."

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general, to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.
The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturist's London Agent, 1A, Bishopsgate Street Within.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road, London.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

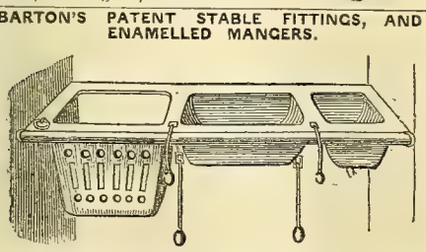
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.



THESE FITTINGS have all the newest improvements, and are the only patented invention of this description. Improved Stable Fittings with Manger, Rack, and Water Trough attached, New Pattern Manger and Water Trough combined; also Corner and Straight Mangers, Plain, Enamelled, and Galvanised Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONMONGER, &c., Manufactory and Warehouse, 370, Oxford Street, a few doors east of the Pantheon.

SCYTHES.

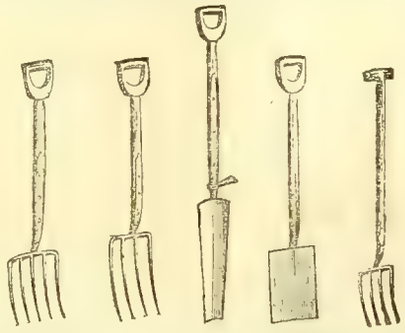
BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.
"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.
To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

RICHMOND AND CHANDLER'S No. 1 CORN CRUSHER (Price 5*l.* 5*s.*) was first introduced a few years ago, as a decided improvement upon others theretofore made. Subsequent time and experience have served to render it more perfect, and to greatly extend the pre-eminent patronage of members of the Royal Agricultural Society, and distinguished scientific authorities throughout the world.—Address, RICHMOND & CHANDLER, Implement Works, Salford, Manchester; and 32, South John St., Liverpool. Export orders completed on the shortest notice.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

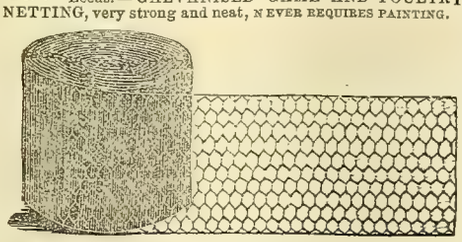


MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.

This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8¼*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

MORTON'S YELLOW GLOBE MANGOLD WURZEL, *saved by Thomas Bennett, Esq., Gloucester, from the Stock originally grown by J. C. Morton, Esq., the Editor of the Agricultural Gazette.*
Seed of this most excellent variety can now be obtained from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, who have purchased the whole of the Stock.

AGRICULTURAL INSTRUCTION.—A Farmer has now accommodation for a Pupil or two who may require instruction in Practical Agriculture, according to the best modern system, combined with economy. Pupils would have an opportunity of seeing the latest improved implements in use, a new and economical system of Irrigation carried out, and also the extensive use of the chief Artificial Manures applied to Corn, Root, and Grass crops, in addition to the ordinary routine of farming operations. References will be given and required. Terms 100*l.* a year; if a horse is kept, 25*l.* extra.—Fuller particulars may be obtained on application to R. VALLENTINE, Leighton Buzzard, Bedfordshire.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

THE THIRD CHELTENHAM SUMMER POULTRY SHOW will take place at that magnificent establishment PITTVILLE SPA, on the 14th and 15th of June. For Prize Lists and full particulars enclose a stamped directed envelope to JESSOP BROTHERS, Secretaries.

The Agricultural Gazette.

SATURDAY, MAY 13, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 17—Agricultural Society of England.
THURSDAY — 18—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 24—Agricultural Society of England.
THURSDAY, — 25—Agricultural Imp. Society of Ireland.

THE references which have been made in past numbers of the *Agricultural Gazette* to the Museum of Animal Products, which Mr. SOLLY is engaged in organising and collecting, will prepare our readers for the following address, which is being now issued in reference to the most important of such products:—

"COLLECTION OF BRITISH AND IRISH WOOLS.—In carrying out the duty confided to me by her Majesty's Commissioners for the Great Exhibition of 1851, conjointly with the Society of Arts, and in forming the commencement of the intended Trade Museum, I am now occupied in collecting specimens of every variety of raw and manufactured animal produce. As amongst animal products wool stands pre-eminent in importance, it is desirable that a very full and complete series of specimens should be obtained; it has consequently been deemed right to apply to all the leading sheep breeders in the kingdom, and I therefore venture to solicit your aid in the contribution of samples of wool of the clip of 1854. Specimens of every kind or variety of wool, and from every locality, are desirable. In the case of distinct or peculiar breeds, two entire fleeces would be preferable to a smaller sample; and where only a portion of the fleece is sent, the part selected should be specified. It is also of the first importance that all specimens should be accompanied by accurate information as to age, time of clip, &c."

We add to this the schedule of inquiries relating to the different points on which information is desired; and we hope that those who are disposed to contribute specimens to the series which will be collected, will at once make known their intention to Mr. SOLLY, Trade Museum, Society of Arts, Adelphi, London.

SAMPLES OF WOOLS.

Contributed by ——, of ——, Parish of ——, County of ——.
Mark or number of sample.....
Breed or variety .....
Age of sheep .....
Sex of sheep .....
Breed of sire and of dam, if a cross breed .....
Time when last shorn .....

Nature of soil and substratum .....
Remarks .....

WE quite agree with Professor WAY in the remark with which he commenced a very instructive lecture on artificial manures, to members of the English Agricultural Society last Wednesday, that the absence of any novelty on the subject does not diminish the importance, and indeed the need, of bringing it again and again under the notice of the farmer. It was not, however, so directly to its agricultural as to its commercial bearings that our attention was directed. A lecture on artificial manures, from considering the wants of the land in order to its fertility, and the ordinary sources of supply for these wants at the command of the farmer, might have proceeded to discuss the deficiency thus apparent, which must be supplemented by artificial means—or from reference to the necessities of individual crops, it might have considered the nature of the artificial application which each must receive in order to its greatest productiveness; but neither of these courses was pursued in the present instance. The *manufacture* and the sources of its raw material were the subject; and the way in which the interests of the farmer in the matter came up for notice arose incidentally rather than directly out of such points as the following—(1), a scarcity, inducing adulteration; (2), concentrated manures, though actually costlier, being relatively cheaper, both in use and in result; (3), the competition of

other manufactures being generally fatal to that of manures, as regards the market value so created for the various offals and refuse matters in which the latter finds its raw material.

The two main ingredients whose sources were considered are nitrogen in its combined forms, as ammonia and nitric acid, and phosphoric acid or phosphate of lime. Among the sources of both, of course, is guano, the costliness and scarcity of which Professor Way informed us have induced excessive adulteration during the present season—gypsum, salt, and sand and chalk being used very often, so as to convert one ton of genuine guano into three tons of saleable material. An impression, it was said, appears to have arisen that some new guano has been imported this year, and of this the dealers in these *manufactured* articles have not been slow to avail themselves in effecting sales. The other sources of nitrogen referred to are blood, flesh, fish, —nitrate of soda—woollen refuse of all kinds—urine, night-soil, and soot. It was to the first and the last of these that our attention was principally directed. The difficulties connected with the use of blood arose in the first place from the value of the article for the manufacture of prussiate of potash, which makes it in the dried state worth 8*l.* a ton, when it is beyond the use of the farmer — and in the next from the difficulty of getting rid of the water which it contains. The latter difficulty, however, might be evaded if not overcome by using the liquid blood to dilute the oil of vitriol employed in dissolving bones, which it would easily do, at the same time that a valuable nitrogenous ingredient would thus be added to the superphosphate manufactured. Refuse fish, too, it was suggested might be pulped and used in a similar manner, for it contained as much water as the liquid blood.

On coal as a source of nitrogen, a good deal of even startling information was given. It appears that coal, on an average, contains 2 per cent. of nitrogen, and that thus at least half a million pounds worth of ammonia (at 5*d.* a lb.) is driven into the air through the chimneys of the metropolis alone—nearly as great a loss as is suffered by the waste flowing into the Thames through its sewers. Professor Way suggested that though manufacturers of coke and consumers of coal will do nothing, and manufacturers of gas but little, to save this ammonia, yet that it might be possible in certain cases to conduct the distillation of coal profitably, with ammonia as the principal end in view, and coke and gas as subsidiary considerations; and where coal, as at the pit mouth, can be had for 4*s.* or 5*s.* a ton, and can be made to yield by distillation 20*s.* worth of ammonia, it was believed that the manufacture of the latter product in this way might be profitably conducted.

The manufacture of ammonia by the direct combination of its elements was referred to as one great object of the agricultural chemist—to which, however, as yet he could hardly look with hope of expectation. Certain steps leading that way had indeed been taken with success, but they were matters of curious laboratory experiment rather than capable of profitable imitation on the large scale.

The sources of phosphoric acid, the other principal material of manure, namely, bones in their several forms, coprolites and phosphorite, were then referred to; and under this head a remark was made upon the dilution with gypsum of the only valuable ingredient in the superphosphate of the manure market, which is an unavoidable result of the manufacture as at present conducted. It was suggested as possible, and in those cases especially where liquid manure drills—an increasingly frequent implement—were employed, and as a desirable thing, to extract the comparatively soluble ingredient and leave the comparatively useless one. The gypsum at present does little more than increase the weight of the manure when it is used dry, and clog and impede the action of the drill when used in so-called solution.

Mr. Way's concluding remarks related to the subject of the sewage waste of large towns. He believes that the economical and profitable utilisation of this material is as yet impracticable. And when, as we know to be the case, the chemist of the Royal Agricultural Society of England, and the intelligent and enterprising Borough engineer of Liverpool—the best representatives probably that can be named, of English knowledge on questions of value and cost in connection with this subject—arrive at one conclusion on the matter, we believe that for the present it must be considered a *conclusion;* and that the various deodorising and desiccating processes which have been patented will not succeed in carrying us past it. Professor Way put the thing on its right footing, when he said that nothing was more likely to postpone the solution of the problem than the dissemination of exaggerated opinion—not of the agricultural importance of the question, but—of the agricultural value of the material in its present form. The question is one for the consideration of the town rather than the country; and sanitary commissioners, not sewage manure companies, are the people to whom the matter must be addressed. The thing must be considered a nuisance to be got rid of at an expense before it can become a property to be profitably utilised.

We have in the above short account given a description rather than a report of a most substantial and instructive lecture.

NOTES ON EXPERIMENTS IN THE BOTANICAL GARDEN OF THE ROYAL AGRICULTURAL COLLEGE.

By Professor J. Buckman, F.G.S., F.L.S.

In this paper I purpose to give notes on 10 species of plants, six of which may be termed economic plants, and four medicinal plants, as follows:—*Economic Plants*: Pastinaca sativa, Parsnip; Daucus carota, Carrot; Cichorium Intybus, Chicory, Succory; Helianthus annuus, Sunflower; Linum usitatissimum, Linseed; and Polygonum fagopyrum, Buckwheat. *Medicinal Plants*: Carum carui, Carraway; Coriandrum sativum, Coriander; Hioscyamus niger, Henbane; and Papaver somniferum, Poppy. My plots of Parsnips and Carrots are derived from wild examples which were brought into the garden for experiment in 1848, and, as the results are somewhat curious and interesting, I shall here describe my proceedings somewhat in detail.

In the spring of 1848 I planted in my experimental plots some seeds of these plants, which were gathered from wild specimens growing in an uncultivated portion of the garden; the result, in as far as the *Parsnip* is concerned, being pretty much as follows. The seed was drilled in rows about 18 inches apart; and as it came up tolerably well, there was a number of plants for observation, which, as they advanced and perfected their leaves, presented some most marked differences in many individuals. It is known that the wild Parsnip leaves are of a dark-green colour, and thickly clothed with hairs of a greater or less length, while the cultivated plant possesses foliage of a light yellowish green hue, and totally devoid of hairs, being, as the botanists describe it, glabrous. Now it is curious to remark that a first year's cultivative process, consisting in gathering the seeds in autumn and planting them in the spring, had the effect of changing the wild foliage to the aspect of the cultivated plant of about 15 per cent. of the specimens that came up here; then as the object was to mark the advance of wild plants under cultivation, the examples with the hairy leaves were destroyed, and the smooth ones left to grow.

In the autumn of the same year the roots were taken up and carefully examined, when it was found that they had greatly increased in size when compared with wild examples, this increase being not merely confined to the enlargement of the tissues of the top root, but to that of the lateral shoots; however, there were some specimens with a cleaner and smoother outline than others, these were reserved for the growth of seed. The seed of the following year was sown in the spring of 1850, in a newly prepared bed, the result of which was a crop of tolerably good and succulent roots, some examples of which were however far more what a Parsnip should be than others. The same process was again adopted in the growth of seed, and a third sowing took place of seed in 1852; but here the results, instead of showing a further advance, proved a retrogression to the state of the second sowing. The reason for this is obvious; here was I sowing the same seed, year after year, under the same circumstances of soil, situation, and climate, and hence the process of cultivation so well begun, and so successfully going on, with repetition tended to degeneration. These experiments seemed valuable, as pointing out the circumstances attending the conversion of wild plants into cultivated vegetables; and, at the same time, show us that when a change is once attained, there is ever a tendency to revert to the wild state, which can only be averted by constantly keeping up the cultivative process—cultivation, indeed, consisting, not in suiting the natural requirements of plants, but in submitting them to circumstances as opposite as possible. But more, the observed facts as respects the Parsnip seemed to point out to me a way to the solution of the mystery connected with the forked method of growth of cultivated roots, known by the name of finger-and-toes; and I have come to the conclusion that this so-called disease is the result of degeneration of seed, arising from many circumstances, the most prominent of which are the repeated sowing in the same locality of own ground seed, the using seed from degenerate specimens, and the using of seed on a poor soil which has been grown on a rich land. In the experiments just quoted, my second crop of roots were fleshy, but, having fleshy forks, they were, indeed, roots in the condition of finger-and-toes; here, then, finger-and-toes may be considered, firstly, as a consequence of the half way advanced from wildness to cultivation, and, secondly, in reversion from cultivation to wildness.*

As respects the *Carrots*, it may be stated that their cultivation was followed out in the same manner as that of the Parsnips, and though the results were satisfactory, as exhibiting a great change, yet the change was not so marked as that observed in the Parsnips, though the same result followed a continuation of the process.

The *Chicory* grows well on poor soils, especially if of a calcareous nature; it is indeed a wild native on our oolites; it lasts a considerable time, sending its roots deeper and deeper into the soil, and growing year by year larger and more succulent herbage. The herbage is eaten with tolerable appetite by cattle; and if the plant be cultivated for feed, it should be cut off before seeding, as allowing the seeds to perfect themselves weakens the plants and shortens their duration. The roots grow to a large size, and contain a bitter extractive matter similar to that of the Dandelion, and may medicinally be used for the same purposes; it has been much used for adulterating and mixing with coffée; and notwithstanding it is even used knowingly with coffee in families, it is a vicious practice, as it contains none of the refreshing properties of the berry; and, indeed, substitutes a medicine for a salubrious aliment.

My plot of Chicory occupied a position between a plot of Sunflowers on the left, and of Linseed on the right, and it was curious to observe that this vicinage, though it affected the former so as to cause them to grow but a few inches high, the growth of the large roots spreading in like manner far under the Linseed plot had not the slightest influence on its growth. From this we see that the roots of a plant may take up matters from the soil which would be required by one species which succeeded and not by another. In the case before us the Chicory and Sunflower, being both plants of the great natural order Compositæ, may be expected to live upon a like pabulum; the Linseed, however, being perfectly different in its nature and structure, requires to a considerable extent a different food.

The Sunflower usually grows to a large size even without manuring, and I think is capable of becoming a valuable and profitable plant to those who keep poultry, as it requires no expense for culture; the corner of a field or waste place may be turned over, and the seeds be planted even in a rude manner, and if merely thinned and hoed at the same time, to free them from weeds, they require no further care.

Linseed.—As respects my experimental plots, I have been surprised to find this plant succeed so well in poor soils. I have grown it on the thin brashes of the great oolite and on the thick clay bed of the Botanical Garden; in all cases without manure, and after almost every kind of experimental crop, and my samples have always been very good; one great difficulty, however, attendant upon the cultivation of Linseed, which can more readily be overcome in small plots than in field cultivation, is that of the prevalence of weeds; the Linseed is, at first, a small and delicate plant, and is easily overgrown by weeds, and if this be so in its early stage it never recovers. In my plots this difficulty is got over by drilling, which allows the hoe to be used, and this could perhaps be done with advantage in field cultivation. That weeds may be expected to prevail in this crop will at once be seen, when, in addition to the facilities offered for their germination by the preparation and fine pulverisation of the soil, in its cultivation the smallness of the seed renders it exceedingly difficult to separate it from seeds of weeds; and, hence, with Linseed we usually find enough of weeds associated to furnish a tolerable crop from this source alone; hence, then, the purest or cleanest seed should always be employed, even at additional cost, as it will, in the end, be an incomparable saving. A few years since some foreign Flax seed was introduced to the College farm, and the crop was spoiled by Sinapis nigra, which has been ever since almost as common as the S. arvensis Charlock, though it scarcely existed there before.

Buckwheat usually grows short with us, but seeds tolerably well; I imagine that the oolites would form good soils for the growth of this plant for seed. I have had little experience of it in an economic point of view; but if found useful, from the facility with which it can be grown, it might become a profitable plant for the corner of a garden or field, or an occasional headland.

Medicinal Plants.—The few plants of this kind which have been introduced into my garden serve the purpose of instructing my class as to their nature, and are not grown with a view of testing their agricultural merits; at the same time such specimens as Carraway or Coriander often form a part of field culture in the neighbourhood of London, their seeds being much employed as a medicine or as a spice, as also for the distillation of their essential oil; they are easily grown, a light pulverisable soil being best adapted for them. Henbane is much used as a medicine, for which purpose it is largely grown in the physic gardens. It requires a rich soil for the production of large and vigorous herbage; wanting this, however, in my garden, causes it to seed all the better, so that while with me the leaves are always small, it produces an enormous quantity of its peculiarly formed seed cases filled with seeds.

Poppies.—Three years since I introduced some of the opium Poppy into the garden, and grew tolerable heads for the first crop. My plot, however, has been kept up with seed from them, in which case the flower has gradually got very small, and the capsules are scarcely as large as a Walnut; indeed, so changed is the plant from its first estate as hardly to appear the same species, thus affording a good practical lesson in the physiological fact attendant upon the growth of seed. Poppies as a crop may be seen in the neighbourhood of most large towns. They grow best in deep rich land. I have seen enormous heads on some of the well-drained lias soils in the vale of Gloucester. *Cirencester, April* 22.

* This subject will be found more fully worked out in a paper in the forthcoming number of the Royal Agricultural Society's Journal.

Home Correspondence.

Lois Weedon Wheat-Culture.—The cavillers against this system do not remember that great feature in in it which gives a value to it even beyond the prominent one of making the country independent of foreign supply for its bread, by making it equally so for its meat. I do not throw away my straw, says Mr. Smith, by seizing for the grain on the natural supplies of manures. Mr. Smith is able to apply all his made manures to the land which produces his cattle food, thus doubling or trebling the usual acreage amounts of those crops which cannot do without it. High manuring is the backbone of high farming; but this high manuring, under our present system, cannot become general, it must be carried out by some at the expense of others; and it is also very generally considered as buying the whistle too dear: but the Lois Weedon system places this within the reach of every man, by enabling him to grow grain on all land which he cannot highly manure, or that he has not capital to lay stock on. Were the system of grain fallow adopted generally, the expense of farming would be much lessened, and such an increase of produce would be raised from our lands as would make us exporters instead of importers of food. Mr. Harkness, the secretary to our Agricultural Society, at much pains, lately brought forward a crowd of evidences on the autumn cleaning and tillage of land; this has been favourably noticed in these columns; but were a system of grain fallows adopted, the possibility of cleaning our lands in autumn, which, indeed, in our dripping climate is very much a matter *in nubibus*, would lose all interest, for we should have no weeds to destroy in autumn. It is much a subject of regret with me, that I have not been in position for the last 26 years to prove the practicability of growing grain crop after grain crop on the same ground in continued succession; but we know that land will produce every second year a crop of grain; that this is the perfection of our modern system of alternation, and on Mr. Smith's plan, and on the one which I have for more than 30 years experimented on, and long advocated, the ground is not called on to do more; the half of the land is in fallow, and I have never known an instance in which the acre of land thus half cropped did not produce equal to, nay exceed, that of the acre whole cropped. With us in Ireland, where labour ever forms a strong obstacle to progress, they are shocked at the additional expense they suppose is incurred by working the ground between the rows of grain; but little ought this to cause apprehension, for the saving of seed (though here I shock an Irishman still more) will cover the extra expense of keeping the ground clean and open, and this, even, where all the operations are manual. As confirmatory of this, I will state the additional expenses incurred in the tillage of an acre of land last year, in rows 16 inches apart, and the saving effected in seed. It is very usual here to sow 14 stones of Oats to the acre broadcast; indeed, I may say it is the average. In my drilled acre I sowed only 4 stones 3 lbs. of Bere, Barley, and Oats, at 1*s.* 6*d.* per stone; I have then a saving of nearly 10 stones of seed. I opened the drills with the garden hoe, which cost 3*s.*, and I gave the land two hand hoeings with the scuffle hoe, and one hand weeding of the rows at a cost of 3*s.* each; altogether, 12*s.* This acre was part of a field of a little over 3 acres, the remaining 2 acres being sown with Oats broadcast, the preceding crop Potatoes and Turnips, foul and badly tilled. It was all sown with clover and Italian Rye-grass, the sowing of the seeds being deferred till after the second hoeing in the drilled crop, and till the grain was shot into ear. While the Clover is most miserable in the broadcast crop, having been much smothered up with weeds, and is now a most foul crop, that in the drills is as fine as could be expected from so late a sowing, and is very clean. The crop of grain I cannot give in bushels, for it is not threshed out, nor am I so situated as to be able to give a very exact statement of it, but it evidently far exceeded the broadcast crop, I certainly think one-third better at least; its superiority was admitted by all who saw it, yet I have no expectation any one individual will adopt the practice on the lowest possible scale, all are too ready to find excuses for indolence—to fancy, with "Critic," any imaginary cause of success, rather than be compelled to acknowledge a self-evident one which tends against their prejudices; to cavil at anything their fathers did not do before them, to seek for difficulties wherewith to apologise for their inertness, their abhorrence of change. In the hoeings I found the earlier the first hoeing took place after the line of braird was sufficiently defined the better, some that was hoed thus early (the scuffle hoe was employed) took the lead within five days of the rest and kept it all along, even to the harvesting; for 24 drills of black Bere of this earliest hoed gave 22 stooks, while 16 rows that were not hoed till 14 days after gave only 11 stooks. I sustain the Lois Weedon system of grain tillage as being the only effectual grain fallow brought into a somewhat wide practice, but I am still disposed to prefer the plan I have so often recommended of sowing single rows, when grain alone is cultivated, at wide hoeing distances. And I do not consider all the conditions insisted on by Mr. Smith as absolutely necessary to the successful issue of our joint purpose—full crops of grain in continuous succession—so tilled as to allow of clean working and constant exposure of the soil to aerial influences. I think the annual bringing up of fresh soil may be dispensed with. I should be disposed, in the first two years, to double dig to the full depth, without throwing the subsoil to the top. I think this double digging advisable, as giving immediately a great depth of broken soil, pervious to air action and to root extension, and I think that this alone, without throwing to the top any more of the subsoil than incidentally reaches it, will bring up sufficient crude soil to supply fresh alkalies, &c., for some years to come, and that afterwards it will only be necessary occasionally to bring up a little of the cruder subsoil to the top, or when the subsoil becomes again consolidated. I think it would also be more beneficial and safer to hoe by hand in the first instance between the rows, going as close as possible to them, so soon as they are distinctly defined, and to follow this up with the double digging, which is a work of more time; the first operation would be run over very quickly, and ought to take place before the young plant has consumed the food contained in the seed, and become alone dependent on the soil and atmosphere—what may be called the weaning time; this would break up the surface, more or less indurated and puddled, and admit a free flow of oxygen to operate on the carbon about the roots of the young plants at the very moment when they most require assistance. If we wait for the double digging being effected, the surface will remain too long unmoved. I submit these observations not with any view of obstructing the progress of Mr. Smith's system. It is the best we have that is sustained by several years of successful practice, and I should be glad to see it become general. My own plans, although they have had a small and desultory practice of over 30 years, sufficient to satisfy myself, are deficient in that continuous and more extensive practice sufficient to satisfy others. The principles upon which they rest, the conditions on which their success depends, are the same as Mr. Smith's; the main difference lies in his sets of treble rows and mine of single rows. In mine all the rows equally participate in some advantages, which in his are limited to the outer rows, and even in them restricted to their outer sides. Future experiments will decide whether these advantages are imaginary or not. Others may try them if they please. I will when opportunity permits me. *J. M. Goodiff.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

Lecture on Manures, *May* 10.—Sir John Villiers Shelley, Bart., M.P., Trustee, in the Chair.—Professor Way, the consulting-chemist of the Society, delivered before the members a lecture "On the progress made in the manufacture of artificial manures," for which, on the motion of Lord Camoys, seconded by Lord Berners, he received the best thanks of the meeting. In the course of this lecture, Prof. Way offered suggestions, founded on scientific reasoning, for the increased efficiency and economy in the manufacture of artificial manures; and detailed, under the following heads, important and interesting facts connected with their respective production: viz., I. Sources of Ammonia: 1, Guano; 2, nitrate of soda and nitric acid; 3, bones; 4, blood; 5, flesh; 6, fish; 7, woollen rags, shoddy, and hair; 8, gas-refuse; 9, coal and soot; 10, urine; 11, elements of ammonia by electric or other agency (?). II. Sources of Phosphoric Acid: 1, Guano; 2, bones; 3, animal charcoal; 4, coprolites, green sand, and phosphorite. III. Preparation of Manures. IV. Sewage. V. Superphosphate of Lime. He referred to the new modes adopted for obviating the inconvenient presence of a large proportion of water in blood and fish by working up those substances into manure; the importance of fishy matter as a substitute for guano, and the desirableness of commencing operations at once near home, instead of taking Newfoundland or other distant stations as an essential element into the arrangements; the plans proposed for separating ammonia from gas-liquor; the large amount of that alkali in coal and soot; the conditions under which the urine of towns may be most advantageously rendered available; the production of ammonia from the generation of nitric acid resulting from electricity passed through common air in contact with an alkali, and an account of the enormous amount of electricity given off by the hydro-electric battery; the unprecedented amount of adulteration at present existing in artificial manures, in many cases reaching 75 per cent. of adulterating matter, and particularly in supplies of guano sold to farmers as "new sorts" recently imported (these "guanos" in reality consisting of a small proportion of real guano, with a large proportion of gypsum, sand, ochre, chalk, and other adulterations); the bad economy of purchasing a bad article at an apparently cheap rate, instead of a genuine article at a fair price; the mode of preparing guano and superphosphate for the Turnip crop; the consideration of sewage, not as a farmer's but as a townsman's question, its importance in a sanitary point of view being considerably greater than in an agricultural one, it being unadvisable to purchase at a low rate inferior sewage compounds, which would require a high-priced manure like sulphate of ammonia to give them the requisite efficiency for agricultural purposes; a statement of the best conditions under which superphosphate could be made.—Mr. Dyce Nicols referred to the importance of butchers' offal, and to the increased value of fishing villages on the north-eastern coast of Scotland, on account of their capability of supplying manuring-matter.—Lord Berners stated that he had obtained a manure which had constantly yielded him results equal to those obtained on trial, side by side, with the best guano, formed of saw-dust mixed with sheep dung and urine, and then suffered to undergo fermentation.—The Earl of Essex inquired the proportion of soluble phosphate in superphosphate, when Prof. Way replied that the superphosphate yielding 12 per cent. was not bad, but that it often amounted to 16 or 17 per cent.—The chairman remarked that no subject was at the present moment so interesting to all farmers as that of manures generally; that they were more dependent upon them day by day as agricultural improvement proceeded; although, as it appeared from what they had then heard, it was not always the best to buy the cheap article.—Mr. Raymond Barker agreed with their chairman to a certain extent, but he hoped, at the same time, that the members would not leave that room with the impression that manure of any kind *must* be good *because* it was high-priced.

Prof. Simonds's lecture on the ages of animals, as deduced from the structure of the teeth and the general developments, was announced to stand for delivery at 12 o'clock on Wednesday next.

Agricultural Improvement of Ireland, *May* 2.—*Feeding of Sheep: General Management.*—Mr. F. Hamilton read a paper on this subject, from which, as reported in the *Irish Farmers' Gazette*, we make a few extracts:—

The first thing I would call the particular attention of the breeder to, is to consider the paramount importance of not making up his mind to adopt or continue any particular breed till he has first carefully studied the nature and locality of his farm, the quality of his pasture, and the winter keep he is about to provide for his flock; as, according to the good or bad quality of his land, and according to his liberality or stinginess of winter keep, so must the breed he is about to continue or commence upon be regulated. A man with an indifferent pasture, and but scanty winter keep, embarking in a stock of high-bred Leicester sheep, would soon find he had made a mistake fatal to his hopes. A similar fate awaits him who with good, sound, and rich pasture, and abundance of winter keep, throws it away upon Cheviots or black-faces; yet I have often met with these two classes of breeders, and often thought how much it would have been to their mutual advantage, had they stood in each other's shoes on the day on which they made their purchases.

The pure-bred Leicesters will never prove the most profitable, unless their perfections are taken proper advantage of. The first of these is their early maturity; and, by a proper system of feeding and sheltering in winter, they can be brought into market at least five months sooner than any other breed. This enables the farmer to keep much greater numbers of sheep on a limited space, as the young wedders will all be disposed of as soon as they are shorn in the month of May; and as they have been artificially kept during the winter, the entire Grass of the farm is given up to the ewes, which can thus be kept in much greater numbers; and if they are supplied with a liberal supply of keep in the spring, it is quite wonderful the numbers that can be kept to advantage. It is quite obvious that the sheep breeder who has dry limestone land, and fine sweet herbage, and who is supplied for the winter with a sufficient stock of Turnips, and who is not afraid of embarking some of his capital in a few tons of oil-cake, or other artificial food—or he who has provided shelter sheds, where the land and the locality may not be so well suited to this breed of sheep—can keep a Leicester flock in greater quantities, and to greater advantage than he can any other; as the true view to take of the matter is, that it is, and always has been, a notorious fact, that a much greater weight of mutton can be produced per acre by Leicesters than by any other breed, and in this way they will pay better than any other, though they may not command so high a price per lb. as those sheep that may have taken a longer time to come to maturity, and consumed a greater amount of food. But the chief value of the Leicesters will be for crossing the various breeds of the country, and producing an animal with as many perfections as can be arrived at, whilst retaining the hardihood of these different breeds, until our general system of sheep farming has attained the height towards which it is making such wide and rapid strides; and good feeding and a quick return more fully appreciated than they are at present, and men have found, by experience, the benefits to be derived from keeping the best breed, and feeding them in the best manner. The improvements of the various breeds, then, by crossing in the manner which may best suit the circumstances of the country, should be our next care. The cross with the Leicester tup, and many of the other varieties, are most valuable sheep. I have often heard people assert that one cross of the Leicester was good, but that subsequently crossing the produce with Leicester blood did not answer so well. In this opinion I could not coincide, as, I believe, every cross with a superior animal tends to the improvement of the breed; and whenever it was found to be otherwise, must have been owing to an injudicious choice of the sizes or dams, or some such circumstance. The Cheviot sheep are crossed with the Leicester tup by the farmers on Tweedside and in Teviotdale, till they are eight or nine parts, or even more, pure Leicester. Yet, each cross is found to be an improvement on the former; still the Cheviot blood retained, though in so small a degree, enables these sheep, so near being Leicesters, to exist and fatten on elevations where the pure Leicester would perish; and there is no more thrifty or excellent sheep for exposed situations, or for folding on Turnips, than this often-crossed breed; and it is no uncommon occurrence to hear a Roxburghshire farmer, in speaking of the improvements made by drainage or otherwise, on his farm, that it had enabled him to bring upon it an extra cross or two of Leicester blood upon the Cheviot ewe. Nothing can exceed the profit to be derived from the Leicesters in favourable localities, or under careful and skilful management; and, therefore, they must hold the first position, as they have always done, and will be found invariably to do, by those who will give themselves the trouble of paying attention to them.

Next to them I would place the cross between the Leicester and Ballinasloe sheep, as being superior to any other breed but the Leicesters themselves for the sound pastures of this country—and far superior to the pure-bred Leicester where but little attention has been paid to forcing the young sheep into an early market; of the early origin of these sheep we know but little. The old sheep of the west of Ireland were distinguished by big heads, long necks, slack behind the shoulders, inclined to a narrow chest, and flat sides, with a deep belly, the inside fat of which, and the time it took to place it there, made them more of a butcher's than a grazier's sheep. On the introduction of Bakewell's sheep, and their far-spread fame, the Leicester tup found his way to the West, and to Mr. Dexter (the first importer of Leicesters) we are indebted for the breed of sheep to which he at first gave his name, and which are now the pride of the far-famed fair in the Park of Garbally, the breed of sheep in Connaught were thus wonderfully improved. The quantity of the old wool

being considerably increased by the cross, and the quality of the Leicester wool improved by both the soil and climate. These sheep have continually since then been crossed with the Leicester blood; and although many flocks are still to be found, bearing too many of the characteristics of former days to place them as being second in value to the Leicesters, still requiring a further and judicious crossing with the pure breed, yet, on the whole, the Ballinasloe sheep are not to be surpassed for the good sound pastures where high farming is not carried on, and that the owner can afford to keep them until they are 20 months or two years old, or even more. But it must be borne in mind that it is only under these circumstances that they are to be preferred, and that the more they are crossed with the Leicesters, the more profitable will they become for this system. The Leicester then, first, and the crosses of the Leicester with the Ballinasloe, second, are the only breeds that should put their foot on land capable of supporting them to advantage. The pure-bred Cotswold never would be very profitable in our country, their appetites being far too good, and their propensity to fatten too slow in proportion. They are well suited to the system of farming carried on in Gloucestershire, which is eaten off Turnips to manure for a Barley crop, to which the farmer looks for his payment, and the Turnips are grown on the soil on which they have eaten off a stolen crop of Vetches, with the addition of a little superphosphate of lime, so that it is to the manure they look more than to the early maturity of the sheep.

Next to the two first breeds I would place the Southdown, or rather the Shropshire Down, which is by far the best of this breed; these seem to be much run upon now in England, and the specimens that were exhibited at the late cattle show at Gloucester excited universal admiration; they carry with them, to all appearance, many of the perfections of the Leicesters. Their symmetry is very perfect, and they are said to possess a greater proportion of lean meat than any other sheep. But until their flesh sells in the market at a much higher price even than it has yet done, and that the Leicester and other long-woolled muttons falls much lower in proportion, it could never pay to keep them on good land, except when folding was required, and for this purpose I believe they are superior to any other sheep; for if the object be to manure the land and look to the Barley crop as the chief profit, so that in this way the farmer can afford to keep on his sheep for a longer period, without suffering a greater loss by it than this manure is able to repay them, the Southdown are the best sheep he can have. Should the breeder have made up his mind that his farm was unsuited to the production of the two first breeds, and that folding was requisite to his land, and that in this way a flock of Southdowns was desirable, I should advise him to get the best ewes he can procure of the Shropshire downs, and annually import the best tups, and keep up a breed of his own, but never attempt to import the rejected ewes of an English flock in a crowded vessel, perhaps where many of them contract the seeds of disease, the progress of which is hurried on by the change from the dry and genial downs they are accustomed to, to the rank pastures and variable climate of this country. This is a system which must invariably lead to grievous disappointment.

The Cheviot ranks fourth in value, but it never can be profitable to breed these sheep unless the object is to raise a flock which are capable of thriving where others would starve. The hardihood of the Cheviot, and the propensity to fatten of their cross with the Leicester, render them very valuable for arable farms, where there is mountain or moory land sufficiently dry for a summer's run. We have much land unstocked in Ireland, particularly in the mountains of the far west, where Cheviot sheep would not only exist, but thrive and pay; and if a little care was taken to raise Cabbages and Turnips at the foot of the mountains for their winter keep, and sheds erected for shelter in snow-storms and at lambing time, they would be turned to much profit; and then, when they were naturalised to the climate and properly wintered, we should hear of less losses in districts where they may have been tried than we do at present; but it is only on lands incapable of producing a superior breed that they could be profitably kept, although their cross with the Leicester are, no doubt, thrifty and good sheep to purchase for fattening purposes, from those who have been induced, from the peculiar situations of their farms, to raise them. But they must be bought in, as they frequently may be, at a price that would never pay a high rent for the breeder, or they will be purchased too dear; and consequently never could be profitably bred on any but very inferior land, where no better sheep could be kept. In naming these four varieties, I think I have mentioned all that are at all worthy of notice for this country.

The breeder, having determined on the system that he is steadily about to follow, and having accordingly fixed on such a breed as may best suit his farm, locality, shelter, and winter keep, his next care must be to see that his system is fully carried out; and bear continually in his mind, that more money can be lost by keeping sheep *too badly* than by keeping them *too well*.

The great thing to remember is, that in this, as in all else. "whatever is worth doing at all is worth doing well;" and, therefore, if we keep sheep at all, they should be kept in the best possible way. A few words will now suffice on the subject of feeding, the first principle of which is, never to allow the animal to lose a moment from the hour he is born until he goes to the butcher; and it will not merely do that he does not lose ground, but he must not lose any time in which we could possibly be obtaining any improvement in his growth, or in his condition, as every hour he stands still or retrogrades he is robbing his owner, not only of the food he is consuming, but of the ground he is standing upon. In feeding sheep to force them into the market at an early age, a little care must be given them from the time they are able to pick it up. This they will do at about seven or eight days old. The cake being ground very fine, is placed in a covered trough in the field with them, surrounded by hurdles, which admit the lamb but excludes the ewe; this is not only a very great help to the milk of the ewe, which is generally scarce enough at an early season, which is the only time to have a really good lamb, and to rear them safely, but it also teaches them to feed from the trough, and obviates the great difficulty of getting them to eat Turnips or cut hay when the season arrives. This is a matter of the greatest importance to the sheep breeder, and I would impress the value of it upon him, as lambs often fall away in the beginning of winter, from not knowing how to eat what may be set before them; and once they are out of condition, not only is it more than difficult to bring them on again, but their digestion becomes impaired, from want of a proper supply of food—dysentery sets in—and when at last they do take to feed they are unable to digest that food which their nature is repugnant to from the first. From this cause arises many a loss in the flock, which a little foresight and care might have avoided. As the quantity of cake consumed at this early age is very inconsiderable, it will cost but little to bring the lambs to the 1st of October; and if they are of the pure breed, they can be put on artificial food and Turnips, and be fattened off by May; but even if they are intended for stores, their treatment must be the same; as, if lambs are not well kept, they never can prove to be profitable. All through the month of September they should have a few Cabbages thrown on their pasture, to accustom them to this sort of food before the Grass begins to fail; and it will be well at this time also to give them a few Swedish Turnips to pick the tops off. But as soon as October comes, they should at once be put up in a small enclosure of Cabbages and Turnips, or put in a field of growing Rape; for either of these is indispensable at this season, as unless every care is taken to learn them to eat without letting them fall off in condition, the losses may prove to be very serious, and those that remain will never rightly recover. If these rules are strictly attended to, the young sheep will eat almost anything you put before them by the end of October; and now they must be housed, or put into small dry enclosures, which are either naturally or artificially sheltered, and put at once on Turnips and cake, and chopped hay, with a little corn, or whatever food may be found to be most economical, and which may be best obtained according to circumstances, observing that the greatest variety you can give them the better they will thrive; and if they are properly cared, they will come to very early maturity if purely-bred Leicesters; and even should they only be intended for stores, this treatment will not be thrown away upon them. As much Turnips as they can consume at one meal should be given them the first thing in the morning; but no more. They must then be left in perfect silence and quiet until noon, when they should get a feed of chopped hay or straw, steamed, with oil-cake or corn mixed through it, which has been finely ground and boiled previously in water; half a pound of cake or corn for the first three months, and one pound for the remaining three, will suffice, making an average of three-quarters of a pound per day for each sheep for six months; another feed of Turnips the last thing in the evening will be quite sufficient. On an average, about 1½ stone of Swedish Turnips per diem will be consumed in the house by hoggets; but I believe in the field they will not eat so much. I am fully convinced, from experiments I have tried, that there would be no difficulty in bringing Leicesters on keep to 24 lbs. per quarter on an average for a large flock, and getting them all off by the beginning of May, or, at all events, before the end of the month. I fed three hogget rams for the Dublin Society's show last year of the pure Leicester breed, on the proportions I have given above, with the exception of half a pound of cake and corn extra, which they got at nine o'clock at night, in addition to what they had in the chopped food; and about the 25th of March, when barely a year old, they were valued as mutton by two Smithfield salesmen, well competent to judge their weights, and whom I asked to tell me what they would have brought as mutton in the Smithfield market on the day previous to the show; and they considered that they would weigh nearly 30 lbs. per quarter if killed, and that they would have fetched 3*l.* 5*s.* each readily. Of course these were not the worst sheep I had, nor the worst cared. I only mention the circumstance to show what might be done. This year I exceeded those weights in putting forward hoggets for the cattle show on the same food and treatment; so that by May the whole of the young sheep could be readily brought to 24 lbs. per quarter at least; and if they were disposed of at this time of year, the number of ewes kept on a farm might easily be doubled, or cattle or sheep fed to advantage on the Grass that otherwise would have been consumed by these young sheep. 24 lbs. per quarter in May would, in most years, produce at least 48*s.* per head, without the fleece, which would be worth, on an average, at all events, 7*s.*, if the sheep had been well sheltered; so that 55*s.* might safely be calculated upon, besides the very great value of the manure. In all food prepared for the use of sheep there should be a good deal of salt used, and they should also have access to lumps of rock salt, which they will greedily lick. They should also be fed each day at exactly the same hour, as, if the least variation is made in the hours of feeding, they suffer almost incredibly from it—rest and quiet being the most essential helps to good feeding. If they be neglected for a quarter of an hour after the usual time, they spend that time in watching about and bleating in an unsatisfied manner, which should never be the case. It is also of much importance to provide them with water, so that they should have constant access to it, whether in or out of the house. Cleanliness, too, in preparing the food, is of paramount importance. The Turnips should be very cleanly washed, and the troughs very well cleaned before putting in the food, and every particle of old food removed, so as to make their meal as palatable as possible, the great object being to get them to fill themselves and lie down to rest as soon as possible. Strict attention to these rules will make all the difference as to whether the sheep pay or not; and neglecting any one of them—which to some might not appear very important—would most probably be the means of destroying the whole of the anticipated profits. Having tried house-feeding tolerably largely last winter, I am of opinion that sheep do better by far in the house than out during the months of December, January, and February; but that by the first of March they should be let out in the daytime. My house-fed sheep increased in weight as much as I could wish during the first three months after I put them in, but about the end of February they began to diminish their pace; but the moment I found them checked I turned them out into a small enclosure for a few hours in the daytime, and they again began to thrive apace. I do not think that house-feeding is of much advantage to the farmer who has good dry limestone land, and who can keep his stock in good condition out of doors all the winter, and whose object may not be to fatten them very greedily, or who may derive more benefit by folding his sheep on Turnips than by bringing them into an early market; but I look upon it as an immense advantage in the wool, a great economy of food, and a means of keeping sheep successfully on farms that are too rank and moist for wintering sheep, but which answer very well for summer feeding; and of this description a good deal of land in Ireland can be found. In feeding sheep, either in the house or out, one of the most important things to attend to is never to have many together; small lots of from 12 to 20 is as many as should be kept in one enclosure, and these must be matched according to their size and strength, as it is of much importance to guard against the weaker members of the flock being bullied by the stronger. Turnips in winter must form their chief food, but Mangold Wurzel and Carrots will be found a great addition. The feed of chopped food in the middle of the day is quite sufficient, if properly prepared, for forcing them on, but a little dry cake or corn late at night is of great service in finishing them off. In calculating the quantity of artificial food to be an average of ¾ lb. ground and boiled, and mixed with the steamed hay, I mean that that quantity should be made up of cake and corn mixed, and the more variety that is used the better. Pea-meal, bruised oats, ground beans, or Indian corn, may all be used with the cake, as they may be procured, to the best advantage; and I find much use in also mixing some bran with their food occasionally, as it serves to preserve them in good health. When the improvement of the land is the main object in keeping sheep—and no greater means of improving land exists—folding is the best means that can be adopted; but where this is an object, Rape is the best crop that can be sown; it is cheaper than Turnips to put in; it can be done at a later season, and the manure made from it and trod in by the sheep is of more value than any other. I am quite surprised that any one should attempt folding on Turnips in this country for this purpose, where Rape grows so well. A large field of Rape, with a piece of pasture joining it, for the sheep to lie at night, is far better for both sheep and land than Turnips, but then the Rape will not last longer than two or three months to advantage, and so can only be used to fatten off bought sheep. A little ashes and guano secure a good crop of Rape, on almost any soil. A stolen crop of Vetches may be eaten off the land by sheep during the months of June and July, and Rape or Turnips put in after to much advantage. A small portion of Vetches being cut, the sheep are netted in the stubble, and the Vetches mown and thrown over the net to them.

Mr. Harkness said: Mr. Hamilton has hardly put the Cheviots at the standard at which they are entitled to be estimated. Within the last 15 years, perhaps no breed of sheep has improved more than the Cheviots. It is, as has been described, an animal of great hardihood, having a close wool, and able to stand severe weather, and Mr. Hamilton might have added that the Cheviot is, probably, the best nurse in existence; in this respect far superior to the Leicester.

I have a memorandum here which was sent to me by a friend, and which shows the progress of improvement in this class in a single locality in Scotland. I do not refer to it merely for the purpose of proving what the Cheviot breed may be brought to, but more particularly to show how, by careful and judicious management, all stocks may be improved. No man ever improved any kind of stock without great observation and careful watching of the different qualities of the animals, males and females, noticing the great variety of success which attends the production of their offspring, and trying to supply the defects he sees in one by the excellences which he finds in another, in the male. Such is the case with the Cheviots in Scotland. This memorandum gives the progressive weight of the Lockerby Cheviots from the year 1839. I need scarcely say that Lockerby is pretty famous for its development of Turnips and Mangolds; but it is not merely to these crops that gentlemen there have paid attention, for they are equally successful with regard to sheep.

Mr. Harkness, in illustration of the marked improvement which good management has brought the Cheviot, half-bred or cross sheep, to within the last 15 years, read the following report of the Lockerby Farming Society:—

"In 1839, the average weight of six half-bred (Cheviot ewe and Leicester), taken out of the premium lot, was 115¾ lbs. In 1840, the average weight of the two best and two worst of the premium lot of that year was 139½ lbs.

	Half-bred.	Pure Cheviot.
1841	130 9-10ths	"
1842	128 1-5th	"
1843	128 3-4ths	"
1844	142	"
1845	175	115
1846	167 2-5ths	122 7-10ths
1847	157	109
1848	170	116
1849	165 3-10ths	104 1-4th
1850	164	106 4-5ths
1851	147	111 7-20ths
1852	155	123
1853	146 3-10ths	116 1-5th
1854	165 one-half	121 7-10ths."

Now, it is a matter of importance to see how, by a little attention and care, this stock has been improved. These sheep, a cross between the Leicesters and pure Cheviots, with an average per quarter of 22 lbs., I am informed, by my correspondent, were sold the other day, in the Liverpool market, at 48*s.*, after the wool was clipped off, or about 55*s.* in the wool. Their age was 13 months. I must observe, however, that they were not from the crossed Leicester, but were a cross between the purest bred Leicester and the purest Cheviot.

Mr. Charles W. Hamilton: There is one subject upon which I wish to touch. I have a strong opinion that our whole prospect of success in any department of agriculture depends in a great measure upon our knowing accurately, to a penny, what that which we sell has cost us to produce, and on that account I must beg to ask my brother for some information as to the actual cost of the hoggets which he raised to an average of 24 lbs. a quarter, and for which he got 55*s.* a sheep.—Mr. F. Hamilton: I gave them three-quarters of a pound of oil-cake, and a quarter stone of Turnips in the day, for six months. The price of cake last year was about 8*l.* per ton. The hay I gave them, and the cost of attendance, I put against the manure—which, indeed, I think far more valuable. It is easy, then, to calculate the cost.

Mr. Rogerson said—

My impression is, with reference to Cheviot ewes and Ballinasloe ewes, that if you buy the Cheviot at 25*s.*, and the Ballinasloe at 34*s.*, 35*s.*, or 38*s.*, put them on the same piece of land, and cross them with the same Leicester ram, I think the Cheviot will pay as well as the other. I do not for a moment contend, that if you want to create a new breed, and improve your stock still further, the Cheviot is the proper mother to breed from. I do not know whether the Cheviot or Ballinasloe ewes are better adapted for the circumstances of the country. That I will endeavour to find out; but as far as my own experience goes at home, in the south of Scotland, we consider ourselves exceedingly well paid, upon what we call our good land, by getting Cheviot ewes, at five years old, from the highlands, where they only breed Cheviots, and have no cross, from which we breed what we call our half-bred lambs—that is a cross between the improved Leicester ram and the Cheviot. The moment we take the produce of these from the mother we put them into a field of fresh pasture, and from that into Rape, which is generally sown in land which is not very good, and which people cannot overtake to put into Turnips. If we have not Rape, we give them white globe Turnips, and after that we put them out to "foggage," at a rate not exceeding 3*d.* a week each. The hoggets are fed, at a rate of 3*d.* per head, by those who grow Turnips. When they go into the Turnips, it may be a week or 10 days before they fairly begin to eat them. The hoggets to which Mr. Harkness alluded were bred in the neighbourhood of Lockerby. They were taken home on the 13th or 14th of August, and put upon Oat stubble, and what we then call seeds until the beginning of October, after that upon white Turnips until about the beginning of January, when they were put upon the yellow Turnip, and after that upon the Swede, until about the 1st of February, when they got something like half a pound of oilcake from that until they were shown as hoggets. You may calculate them at a cost of half a pound of oilcake each from the 1st of February until the middle of April, and about 3*d.* a week each, on an average, for Turnips, from the 1st of October until the 15th of May. They cost exactly 1*l.* 1*s.* when they were bought on the 13th of August, having been lambed in the month of April previous, and they were sold the other day at Liverpool, after being clipped, at 48*s.* I may observe that in the Highlands of Scotland the Cheviots are altogether superseding the black-face sheep; and I think a great deal of the land in Ireland would pay better by putting Cheviots than Leicesters on it, but that is merely my opinion—I do not know so from experience.

May 3.—At the half-yearly meeting of this Society, Mr Harkness read the Report, from which we learn that:—

"During the past year 217 new members have been added to the society. The Council is happy to state that the local farming societies are on the increase; and as the support of these valuable associations form a prominent object of the society, the Council confidently appeals to the landed proprietors of every class, and to the friends of agriculture throughout Ireland, to become members of this institution, which will enable the Council still further to increase their sphere of usefulness. The monthly evening meetings, for the discussion of subjects of scientific and practical importance to husbandry, continue to attract much public attention, and thereby to promote another prominent object of this institution—the diffusion of the knowledge of sound and economic principles of husbandry. The Society's Cattle Show for 1854 will be held in the city of Armagh, for the province of Ulster, during the week commencing Monday, the 7th of August next, as has been already fully announced through the public press. In making this arrangement the Council has had special regard to the periods at which the national shows of England and Scotland are to be held in the months of July and August, thereby affording ample time to breeders and exhibitors from Great Britain to convey their stock to the show at Armagh, which, from the favourable arrangements effected by the local committee with various railway and steam-boat companies will, we trust, be

accomplished with much facility. These favourable circumstances, as also the large amount of premiums, exceeding 1200*l.*, now offered for the improvement of stock, in addition to the convenient locality selected for the show, induces the Council to expect increased competition, not only from Irish, but also from eminent English and Scotch breeders."

Calendar of Operations.

MAY.

BORDER OF THE FENS, *May* 6.—Three months of uninterrupted fine weather have not exhausted our tillage operations; our horses have still their daily tasks, but our range of labour becomes restricted every day within narrower limits, and we are now confined to the Turnip land, which progresses fast towards cleanliness and adaptation to its intended purposes; Potatoes, Carrots, and Mangolds are disposed of, and though the two former are rather late in making their appearance, yet the recent very seasonable showers will no doubt soon bring them forward, and the excellent preparation that the remarkably dry spring has enabled industrious husbandmen to give to their arable land, will, in all probability, meet with ample reward in the future vigour and fruitfulness of their crops. Some persons complain of the spring sown corn not having vegetated well, owing to the extreme dryness of the bed; this, however, is not our case, Oats and Barley looking thick enough, and healthy. The Beans are making their appearance regular and well. We observe a considerable breadth of spring Beans in the fen, which is rather surprising, as they are scarcely ever a productive crop on fen land; one reason assigned by a friend is, that he is certain of 5 quarters of Wheat an acre the next year after a crop of Beans. The Winter Beans on high land do not look promising at present; the tops were so much injured by the severe frost of winter, and the plant was thinned previously (query—by the slugs?). We are proceeding rapidly with Wheat hoeing at 2*s.* 6*d.* per acre. Some farmers affect to question the utility of hoeing Wheat, there cannot be a doubt this year of that operation being highly beneficial, as is shown by the immediate improvement of the plant; for, although Wheat likes dry weather, yet, on poor light soils it got starved, and has been rather extensively ravaged by wireworms. On heavy land and good loams the Wheat has not at all suffered, but, on the contrary, is very strong and stocky, and has come forward very rapidly during the last fortnight. We are getting our stock out of the yards, although the pastures are rather backward; but Turnips and Mangolds being consumed, and the hay and fodder getting scant, and cake still very high, there is a general gaol delivery; besides, the manure is wanted, and is about to be first turned over in the yards themselves, as the speediest way to throw the heaps into a sufficient fermentation. I observed last week a very bulky lot carted from a straw yard into a field; it was dry and partly mouldy, and would not improve by such a very inefficient process—very different to another heap I noticed a mile distant from the former one, where the carts were drawn up a mound as high as a house, and so trampled and pressed some very good stuff, which only wanted, as it appeared to me, a little more moisture to be speedily reduced to "spit manure," which (if used before too great an escape of ammoniacal gases) will make itself felt for a year or two after application. We think the best plan is to turn the manure over in the yard into heaps at least 6 feet high, mixing that from the stables, piggery, and other sources in layers as you proceed. This mode we adopted with a heap for Mangolds put together only a fortnight before using it, and it loaded into the carts short and pungent, and ridged capitally. Dry weather proverbially suits sheep; and the lambing season, though not a very productive one, has been attended by fewer losses than usual in this neighbourhood, the last very wet year did not occasion such a prevalence of the "rot" as is heard of elsewhere, principally, we believe, in the West of England. This diminution of that serious calamity is to be attributed to the immense extent to which drainage of land has been carried, of which not the least good derived has been the more healthy habit, induced among sheep, which are also much improved by all other kinds of improved management of land; for instance, how common it used to be to see sheep turned among foul land to pick up some of the rubbishy Grass and weeds, as well as upon fallows allowed to remain too long before being stirred; this is a false economy, only permissible in poor barren spots; for where the land is fertile the farmer cannot afford to let such a "superfluity of naughtiness" accumulate—enough for a middling flock to work hard upon for a living. This is rather a slack time of year for labourers, who are earning commonly 13*s.* a week. *J. W., Peterborough.*

WESTER ROSS, *May* 8.—Agricultural labour is further advanced now than it ordinarily is at this season of the year. The continued drought throughout last month, which bade fair to alarm the proverbially excitable agriculturist, was particularly conducive to agricultural progress. Cleaning of land was proceeded with with great facility. Spring seeds fell into a dry and auspicious bed; and as, in this quarter, there was abundance of sap, the braird now appears regular and strong. The anticipations of the farmers are, in the spring season, invariably in advance of the season of the year, and fortunate it is that these anticipations are not realised. We would like to have summer weather with corresponding vegetation in the month of April, forgetting that the "gab of May" would cut off all such premature growth. A few fields of early sown and far advanced Oats have, by easterly winds and frosty nights, been deprived of their beautiful green colour, and are now farther behind than fields that were sown much later. Wheat and Grass throve well, and were far advanced until towards the end of April; the frosty winds checked their growth and changed their colour. We have had within these eight days abundance of seasonable showers, which, with warmer weather, is speedily setting to rights discoloured Wheat and stinted Grass. Wheat is strong and broad-bladed, and (if not premature to venture an opinion), is likely to be well strawed. The quantity of Barley and Oats sown this year is probably under the average, as Wheat has somewhat encroached on the space ordinarily growing Barley, and Potatoes on that in which Oats used to be grown. Last year's crop of Oats was a miserably poor one, and now they are selling at 36*s.* per quarter, and can scarcely be had at any price. There were good prices for cattle at last Muir of Ord market, although, on account of the continued drought, the demand was not so brisk as at the corresponding market last year. The price of sheep, although still high, has fallen a good deal since last year. With these seasonable showers and abundant keep, the demand for cattle is likely to increase. Wages of servants and labourers are higher than usual, with abundance of employment.

Notices to Correspondents.

AGRICULTURAL SOCIETIES: *G H.* Agricultural Society of England at Lincoln, July 17; Highland and Agricultural at Berwick, first week in August; Agricultural Improvement Society of Ireland at Armagh, August 7. As to the other societies, we have no information.

BONES, &c.: *B B B.* If you can procure charcoal dust sufficient to absorb all the drainage from the pig-sties, &c., then you had better let them run into a receptacle large enough, to which a daily addition of charcoal, and a weekly addition of the bone-dust, which you say you can procure, is to be made; and the whole being removed at intervals and thoroughly mixed, will form the best possible artificial guano.

BUCKWHEAT: *L P* asks if Buckwheat will answer as food for horses. We know of no experience on the subject. Perhaps some one will supply it.

CIDER MUST: *A Subscriber.* It would furnish food for plants; and you will probably make it undergo putrefaction, by mixing it with hot farm dung, or by turning it over, and soaking it with liquid manure.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

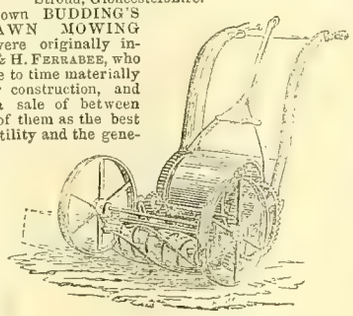
Priced lists of plant tubs and boxes forwarded on application.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

THE IMPROVED LAWN MOWING MACHINE,

MANUFACTURED BY

J. AND H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.



The well-known BUDDING'S PATENT LAWN MOWING MACHINES were originally introduced by J. & H. FERRABEE, who have from time to time materially improved their construction, and can refer to a sale of between 4000 and 5000 of them as the best proof of their utility and the general satisfaction which they have given.

The Machines offered this year by J. & H. FERRABEE are superior to any yet produced, being perfectly adapted for cutting the Grass on Lawns and Verges, and between flower beds: while their strength and durability have been increased and their management simplified. Any person can use them effectually without the least practice. They can be adjusted to cut various lengths of Grass, and will produce a more even and uniform surface than the most skilful mower. The Grass is cut best when dry, so that a machine can be employed at the most convenient time to the workman, and more than double the work may be done with the same manual labour that is requisite with a scythe.

SIZES AND PRICES.		£	*s.*	*d.*
Hand Machine, for One Man, cutting	16 inches wide	5	15	0
Ditto for Two Men,	22 ditto	6	10	0
Pony Machine,	28 ditto	10	0	0
Horse ditto	36 ditto	16	0	0

The Horse Machine will cut the longest and coarsest Grass usually met with on Lawns and Pleasure Grounds.

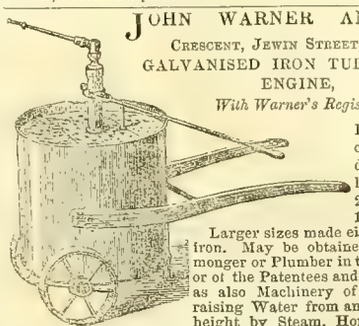
London Agents:—Messrs. BOULNOIS & SON, Baker Street Bazaar, Portman Square.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

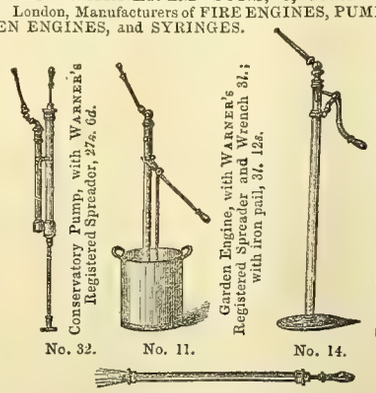
With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with Warner's Registered Spreader, 27*s.* 6*d.*
Garden Engine, with Warner's Registered Spreader and Wrench 31.; with iron pail, 3*l.* 12*s.*
Patent Conservatory Pump, with Warner's Registered Spreader, 2*l.* 13*s.*; with iron pail, 3*l.* 5*s.*
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids. Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

IMPROVED WATERPROOF FLEXIBLE HOSE FOR WATERING GARDENS, AND AGRICULTURAL USES generally, at E. SPENCER & CO.'s, GENERAL WATERPROOFERS, 116, Fenchurch Street, opposite Mark Lane, London.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws	30	feet	high	...	£4	10
No. 2 „ 15 „	„	45	„	...	5	10
No. 3 „ 28 „	„	45	„	...	6	18

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws	25	feet	high	...	£2	15
No. 13 „ 12 „	„	30	„	...	3	5
No. 11 „ 16 „	„	40	„	...	4	0
No. 12 „ 24 „	„	45	„	...	5	0
No. 14 „ 30 „	„	45	„	...	5	18

A large assortment of every description of Garden Syringes Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.

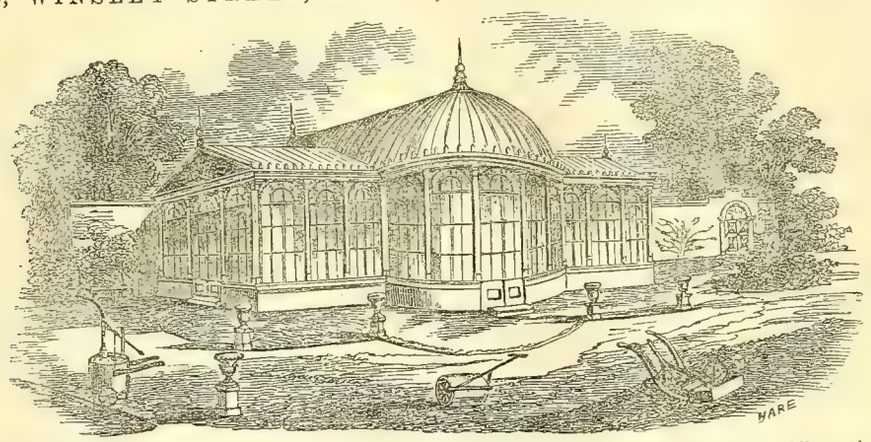
J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. This price does not include carriage, package, or expenses of delivery in the country.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works Nine Elms, London.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

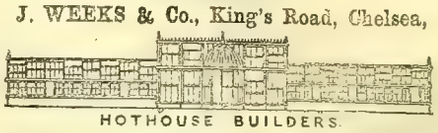
DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also wholesale and retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY AND CO. (Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130*s* and 131, Oxford Street, second and third doors west from Holles Street.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

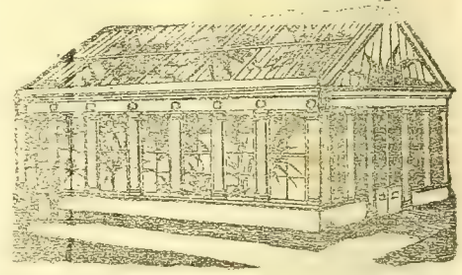
The splendid collections of Stove and Greenhouse Plants, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

TO GENTLEMEN'S GARDENERS.
VILLAGE INN, WITH 10 ACRES OF LAND.

TO BE LET, a VILLAGE INN, situated near Great Yarmouth, with large Garden and pretty Grounds (2½ acres), besides Arable and Meadow Land, &c. (7½ acres). The House, which a few years ago was a gentleman's residence, is capacious and well arranged, and in excellent repair, with Stables, Coach-house, Sheds, &c. Possession at Michaelmas next. The above is eminently adapted for a gentleman's gardener desirous of retiring from private service, with a small capital. Unexceptionable references required.—Apply to the Rev. T. G. F. Howes, Belton Rectory, Great Yarmouth, who desires it to be understood that applications which remain unanswered are declined.

TO BE LET, with immediate possession, a NURSERY and FLORIST'S BUSINESS, three miles west of Hyde Park Corner, containing a convenient Dwelling House, Five Greenhouses, Frames, an Acre and a Quarter of Ground, Sheds, &c., together with the Stock. A good jobbing connection.—Apply to Mr. Hughes, near the Church, Hammersmi h.
N.B.—A Lease if required.

TO BE LET, a good DWELLING HOUSE and NURSERY GARDEN, with Greenhouses, and stocked with the best kinds of Plants, Shrubs, and Fruit Trees, to be taken at a valuation. Immediate possession. Rent reduced from 65*l.* to 40*l.* per annum.—Apply to William Harris, Gardener, 23, Montpellier Walk, Cheltenham.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

BRAHMA POOTRA EGGS, from the choicest Birds of an Amateur, Brahmas of whose breeding have competed successfully at the first Shows in the Kingdom, viz., the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Norwich, Winchester, and Manchester. Price three guineas per dozen, warranted from the best prize and selected birds only.—W. C. G., Post Office, Sandbach, Cheshire.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

EGGS FOR SITTING, of the Choicest Varieties.—Most of the Birds have taken Prizes at Winchester, Southampton, Surrey Gardens, and Salisbury Exhibitions. White and Black Cochins, White Polands, and Ptarmigans, 21*s.* per dozen; Pure Buff Cochins, 15*s.* per dozen. Post-office Orders payable to Frederick Flight, 72, High Street, Winchester.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

THE GRAPE BLIGHT.—This disease having reappeared in England this season, Cultivators desirous of saving their fruit should apply immediately for its only effectual preventive and cure, McAdams' ANTI-GRAPE BLIGHT COMPOSITION. Half pound packets (sufficient for 70 square yards of Vine) with printed directions, 5*s.* each.—London Agent, Mr. J. Hayne, 8, Liverpool Street, Bishopsgate. Paid orders forwarded.

CURE FOR MILDEW ON GRAPES, &c.—In consequence of the increased prevalence of mildew on the Vines, &c., during the last few seasons, G. Taber, of Rose Cottage, Rivenhall, practical Gardener, Seedsman, and Florist, has directed particular attention to the best mode of preventing it, or for curing the Vines that have been attacked, and he now begs to announce that he has succeeded in preparing a composition known as TABER'S ANTI-MILDEW COMPOSITION, which will effectually prevent or cure the disease without doing the slightest injury to the Vines; and any person, by the aid of the printed instructions, may use it without risk. It is also an invaluable remedy for preventing Mildew on Wall Trees, Roses, &c. Sold in packets containing 1 lb., 1*s.* 3*d.*; 3 lbs. 3*s.*; 6 lbs. 5*s.* 6*d.*, with directions for use. By enclosing two postage stamps, G. T. will send a circular with full particulars as to quantity required for a house for the season, and also testimonials of the success he has met with.

G. T. will personally attend gentlemen, and give instructions to their gardeners at a reasonable remuneration for time and travelling expenses. The trade supplied at the usual discount. Post Office orders to be made payable to George Taber, and drawn upon the Witham Post Office. Postage stamps received in payment of small orders. Packets delivered free to the Witham Station of the Eastern Counties line.—Address George Taber, Rose Cottage, Rivenhall, near Witham.

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.

THE CHOLERA
Prevented by the Destruction of all Noxious Effluvia.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts, 2*s.*; Pints, 1*s.*; Half-pints, 6*d.* Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1*s.* 1½*d.* per box.—Observe that "Frampton's Pill of Health" is [illegible]

OPENING OF THE CRYSTAL PALACE, 1854.

It is intended to OPEN the CRYSTAL PALACE and PARK on the 10th of JUNE, after which they will be open daily, Sundays excepted.

The following are the arrangements for the Admission of the Public:—

Five Shilling Days.—On Saturdays the public will be admitted by payment at the doors, by tickets of 5*s.* each, and by tickets to include conveyance by railway.

Half-Crown Days.—On Fridays the Public will be admitted by payment at the doors, by tickets of 2*s.* 6*d.* each, and by tickets to include conveyance by railway.

Shilling Days.—Mondays, Tuesdays, Wednesdays, and Thursdays will be 1*s.* days. At the gates, a payment of 1*s.* each will admit the public, or tickets entitling the holder to admission to the Palace and Park, and also to conveyance along the Crystal Palace Railway, from London Bridge Station to the Palace and back, will be issued at the following prices:—

Including first class carriage	2*s.* 6*d.*
Including second ditto	2*s.* 0*d.*
Including third ditto	1*s.* 6*d.*

Children.—Children under twelve years of age will be admitted at half the above rates.

Hours of Opening.—The Palace and Park will be opened on Mondays at 9 o'clock, on Tuesdays, Wednesdays, and Thursdays, at 10 o'clock, a.m., and on Fridays and Saturdays, at 12 o'clock, and close every day an hour before sunset.

Season Tickets.—Season Tickets will be issued on and after Monday the 15th May, at two guineas each, to admit the proprietor to the Palace and Park on the day of opening, and on all other days when the building is open to the public, up to the 30th April, 1855.

No Season Ticket will be transferable or available except to the person whose signature it bears.

Family Season Tickets.—Members of the same family who reside together have the privilege of taking Season Tickets for their own use with or without Railway conveyance on the following reduced terms:—On two tickets a discount of 10 per cent. on the gross amount; three tickets, a discount of 15 per cent.; four tickets, a discount of 20 per cent., and five tickets and upwards a discount of 25 per cent. Families claiming the above privilege, and desiring to avail themselves of it, must apply in a prescribed form, which may be had at the Office, 3, Adelaide Place, and at the other offices for tickets. These tickets will be available only to the persons named in such application.

Railway Season Tickets, including conveyance along the Crystal Palace Railway from London Bridge to the Palace and back, are issued by the London and Brighton Company, at their Offices, London Bridge. Single Tickets, 4*l.* 4*s.* each; Family Tickets at the same reduction as above.

Special Regulations and Bye-Laws.—All the General Provisions and Regulations mentioned above are to be understood as being subservient to such Special Provisions, Regulations, and Bye-Laws on the part of the Railway Company and the Palace Company as may be found necessary to regulate the traffic, and to meet special occasions and circumstances which may from time to time arise.

By order of the Board,
G. Grove, Secretary.

Adelaide Place, London Bridge, May 13, 1854.

Marlborough House, 10th May, 1854.

MR. GLENNY requests that REPORTS of all the HORTICULTURAL and FLORAL EXHIBITIONS may be sent to him for publication, and that specimens of Fruit, Flowers, Plants, and Vegetables, as well as other subjects for his opinion, may be addressed, Mr. Glenny, 420, Strand.

DUNN'S TAILORS' LABOUR AGENCY invites public attention to the principles on which it is conducted, and by which it offers unusual advantages both to the producer and the consumer, combining high wages to the one with low charges to the other. Conducted by the Agent at small cost, it secures the best labour and pays the best price for it; while it appropriates a part of its trading profits to the moral and social elevation of its operatives, and has provided, at a cost of nearly One Thousand Pounds, Schools for the Education of their Children, Lecture Hall, Library, Warm Baths, &c. See a more lengthened statement in the *Times* of any Wednesday, or send for a Prospectus. A useful Dress Coat, 28*s.*; Wages paid for Making, 10*s.* 6*d.* A first-class Dress Coat, 2*l.* 16*s.*; Wages paid for Making, 15*s.*—Nos. 13 and 14, Newington Causeway, and 39 and 40, Bridge House Place, Opposite. No connection with any other House.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit William S. Burton's SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

TEA URNS, OF LONDON MAKE ONLY.—The largest assortment of London-made TEA URNS in the world (including all the recent novelties, many of which are registered) is on Sale at William S. Burton's, from 30*s.* to 6*l.*

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is William S. Burton's.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 17*s.*; Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21*s.*; and Cots from 21*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 19*s.* to 13*l.* 13*s.*

PAPIER MACHE AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

Gothic shape Papier Maché Trays,

per set of three	from 20*s.*	to 10 guineas.
Ditto, Iron ditto.	from 13*s.*	to 4 guineas.
Convex shape, ditto.	from 7*s.* 6*d.*	

Round and Gothic Waiters, Cake and Bread Baskets equally low.

William S. Burton has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads, and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

HEAL AND SON'S SPRING MATTRESSES.—The most durable Bedding is a well-made SPRING MATTRESS; it retains its elasticity, and will wear longer without repair than any other mattress, and with *one* French Wool and Hair Mattress on, it is a most luxurious Bed. Heal & Son make them in three varieties. For prices of the different sizes and qualities, apply for HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced LIST OF BEDDING. It contains designs and prices of upwards of 100 Bedsteads, and prices of every description of Bedding, and is sent free by post.

Heal & Son, 196, Tottenham Court Road, London.

TYLOR AND PACE have removed from 313, Oxford Street, to larger and more commodious premises, 104, New Bond Street, which will enable them to keep a much larger stock in all the different branches of their manufacture, including a very extensive assortment of Iron and Brass Bedsteads, Children's Cots, Portable Bedsteads, and Chair Bedsteads, with suitable Bedding and Mattresses. A Large Show Room is entirely appropriated to the exhibition of Baths and Toilette Ware of every description, all at the most moderate prices. An increased assortment of Venetian and all other Window Blinds, Outside Blinds, and Transparencies. Illustrated Catalogues of Bedsteads, Baths, and Window Blinds, are published separately, and will be forwarded post free on application by naming the description of article required.

Tylor & Pace, 104, New Bond Street, London.

DEVONSHIRE CYDER.—A three dozen case (large bottles), of the very best DEVONSHIRE CHAMPAGNE CYDER, will be forwarded to any address on receipt of a Post-office order for 21*s.*, payable to John E. Rendle, Martin Street, Octagon, Plymouth. Case and bottles, value 9*s.*, included.

ANOTHER CURE OF COUGH AND HOARSENESS BY DR. LOCOCK'S PULMONIC WAFERS.

"Epsom, Feb. 6, 1854.

"Gentlemen,—For some time past I was afflicted with a most distressing Cough and Hoarseness, and which I thought, from various symptoms I observed, would conduce to Consumption. After having tried several remedies, and finding little or no relief, I determined to try a small box of your Dr. Locock's Pulmonic Wafers, and, to my surprise, in less than two days I found myself perfectly restored; and it is with deep-felt gratitude I return my sincere thanks to you and Providence that I am by means of your invaluable medicine thus perfectly restored.—I am, gentlemen, yours thankfully, G. Wyatt."

TO SINGERS AND PUBLIC SPEAKERS they are invaluable for strengthening the voice. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s* per box. Sold by all medicine vendors.

DEAFNESS.—NEW DISCOVERY.—The Organic Vibrator, an extraordinarily powerful, small, newly invented instrument, for Deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be produced; being of the same colour as the skin is not perceptible. It enables deaf persons to hear distinctly at church and at public assemblies; the unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Invaluable newly-invented Spectacles. The most powerful Patent Telescopes, possessing such extraordinary power, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's Moons, Saturn's Ring, and the Double Stars. Opera, Camp, Race-course, and Perspective Glasses to know the distances. Also a very small, powerful, Waistcoat Pocket Glass, the size of a walnut, to discern minute objects at the distance of from four to five miles.—S. & B. Solomons, Aurists and Opticians, 39, Albemarle Street, Piccadilly; observe, opposite the York Hotel.

DEAFNESS, SINGING IN EARS, & NERVOUS DEAFNESS.—New mode of instantly restoring hearing without operation, pain, or use of instruments.—By one consultation, a permanent cure is guaranteed to any sufferer, although partially or totally deaf for 40 or 50 years. This extraordinary discovery is known and practised only by Dr. Hoghton, the eminent Aurist of the Suffolk Place Institution, and is applied by him daily on numbers of deaf applicants with perfect success in every case, enabling deaf persons instantly to hear conversation with ease and delight. Testimonials can be seen from the most eminent physicians in England; also certificates from all the London Hospitals and Dispensaries, and numbers of letters from patients cured, in all grades of society, from the peer to the peasant. Dr. Hoghton, Member of the London Royal College of Surgeons, May 2, 1845; L.A.C., April 30, 1845. Consultations every day from 12 till 4, without payment of fee, at his residence, 9, Suffolk Place, Pall Mall, London.

Just published, Self-cure of Deafness, for Country Patients; a Stop to Empiricism, Quackery, and Exorbitant Fees. Sent on receipt of seven stamps, free.

NEW SIPHOCAMPYLUS.

W. J. EPPS has much pleasure in offering the following, feeling they cannot fail to give the highest satisfaction. Strong plants are now ready for delivery.

SIPHOCAMPYLUS NE PLUS ULTRA—Very dwarf habit, with bright green foliage, producing flowers of the most brilliant scarlet in threes and fours at the axle of every leaf; the best of the genus, 10*s.* 6*d.*

BICOLOR ROSEA—Deep crimson, tipped with pale rose, very distinct and beautiful, very dwarf and compact habit; 10*s.* 6*d.* The usual discount to the Trade.—Nurseries, Maidstone.

NEW SEEDLING DAHLIAS.

N. GAINES begs to inform his Friends, both Amateurs and Nurserymen, he is now sending out his new SEEDLING DAHLIAS, viz., Alba Superba, Primrose Perfection, and King of the Yellows, at 10*s.* 6*d.* per plant. He can supply a quantity of his Dwarf Dahlias, Prince Arthur and the Dwarf; the two latter are well adapted for beds upon the lawn, not growing more than 18 inches high. He has a large quantity of Bedding Plants, such as Yellow Calceolarias, Tom Thumb Geranium, Verbenas, Petunias, Geranium Unique; Scarlet, White, and Crimson Fuchsias, Liliums, &c. His Show and Fancy Pelargoniums are now in flower, filling 10 houses, containing one of the largest collections in the country. May be seen gratis every day, Sundays excepted, at the Nursery, Surrey Lane, Battersea.—May 13.

HONEYSUCKLE VERBENA.—So named for its delightful perfume, which is so near the odour of the Honeysuckle that it cannot be distinguished from it. Last season it was the constant inquiry of visitors at the Nursery Grounds if Honeysuckles were growing near, or what flower so much resembled them in fragrance, and on being informed it was the above new variety of Verbena, they were much surprised, and immediately ordered plants of it. Description—viz., compact habit, fine glossy foliage (will do excellently for bedding, or as a plant for pot culture), long stems to flowers, making it very useful for bouquets—blooms most abundantly; colour rich dark crimson, shaded lilac, very distinct eye; the truss of a fine globular shape, generally measuring 9 inches in circumference, all the pips fully expanded. It will force well during the winter, being a great advantage for cutting, or for its perfume in a greenhouse or conservatory at that season of the year; it will also stand the sun and rain during summer better than any other Verbena. A few blooms added to a bouquet will give it the scent of the sweetest Honeysuckle. Fine strong plants are now ready for sending out, 3*s.* 6*d.* each.

LOBELIA LINDLEYANA.—The subscriber having purchased the whole stock of the above new Lobelia of Mr. Keynes, Salisbury, he begs to offer it to the public. It was awarded a Certificate of Merit at the Horticultural Society and National Society of London, June 1853. Description—viz.: Habit, dwarf and compact, flowering very freely, covering the whole surface of the plant; distinct in colour from all others yet out, being a bright rosy lilac. It is an excellent bedding variety, and will be sure to please every one who grows it, especially for its distinct colour and profusion of bloom. Strong plants now ready at 3*s.* 6*d.* each.

The usual allowance to the Trade when three plants of either are ordered. On receipt of a post-office order or penny postage, stamps to the amount, the plant or plants will be sent postage and package free.—EDWARD TILEY, Nurseryman, Seedsman and Florist, 14, Abbey Church Yard, Bath, Somerset.—May 13.

ARTHUR HENDERSON AND CO. take the earliest opportunity of informing their friends and the public, that their CATALOGUES No. 3 and No. 6 are now ready, and can be had, post free, upon application.

No. 3 contains descriptive lists of Geraniums, Verbenas, Fuchsias, Calceolarias, Cinerarias, Chrysanthemums, &c., amongst which will be found all the best novelties of the season, also the choicest selections from former years.

No. 6 contains descriptive lists of all the newest and best Stove, Greenhouse, and Hardy plants, amongst which will be found many new and desirable plants.

The following new plants are now on sale:

SEEDLING GLOXINIAS.

ELEANOR.—Ground colour pure white, blotched with rose, and shaded with purple.

ELEGANTISSIMA.—Ground colour French white, of great substance, centre pale lavender, spotted with buff.

EUGENIE.—Ground colour rosy pink, centre creamy white, spotted with rose.

EXQUISITE—Ground colour pure white, with broad belt of puce, throat creamy white, spotted with puce.

MAGNET.—Ground colour clear rose, with blotch of purple in the throat, flowers large, of fine form.

PRINCE OF WALES.—Ground colour white, shading off to lavender.

SIR C. NAPIER.—Ground colour deep rosy crimson, throat blotched with intense rose, dwarf habit.

The above seven Gloxinias will all be found to be fine varieties, with large well-formed flowers standing well up above the foliage. 7*s.* 6*d.* each, or 42*s.* the set.

CINERARIA EVA.—Ground colour pure white, with narrow margin of purple, dark disc, fine form and substance; received a Certificate at the National Floricultural Society. 10*s.* 6*d.*

GERANIUMS.

DIADEMATUM REGINA.—Ground colour deep shining rose, upper petals veined with dark purple and white, with blotch of bright orange crimson; very dwarf habit, and abundant bloomer; a fine variety for bedding. 7*s.* 6*d.*

DIADEMATUM SIDONIUM MULTIFLORUM.—Lower petals rosy purple, shaded with crimson; upper petals orange crimson, veined with dark maroon; trusses large, habit dwarf and compact, abundant bloomer; a fine variety for bedding. 10*s.* 6*d.*

PRINCESS.—Ground colour blush white, veined and shaded with carmine, dark horse-shoe foliage, large globular-shaped trusses, and most abundant bloomer. 7*s.* 6*d.*

CETERACH MARANTA (syn. Nothoclena maranta).—A new hardy Fern from the Alps of Switzerland; fronds bipinnate, about 8 inches in length, densely coated with golden brown scales on the under side. 15*s.*

Pine-apple Place, London, May 13.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

Sales by Auction.

PLANTS AND FLOWERS.

NORLAND NURSERY, NOTTING HILL.

MESSRS. HAMMOND AND EILOART will sell by Auction, on the premises, as above, on TUESDAY, May 16th, at 12 o'clock, the entire stock of 1500 Geraniums, 400 Chrysanthemums, 500 Heaths, 300 very fine Azaleas, 200 Camellias, 8000 Bedding Plants in every variety, a few Trees, Shrubs, &c.—On view the day prior and morning of Sale. Catalogues on the premises, and at the Auction offices, 28, Chancery Lane.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 16th May, at 12 o'clock precisely, a selection of BRAHMAS, COCHINS, &c., from the yard of John Fairlie, Esq., of Cheveley, including some of his best brood stock; Brahmas from Mr. Cannon, of Great Marlow; choice birds from C. Rawson, Esq., Mr. G. Griggs, Mr. Eason, and others, many of which are first-class specimens. Also a SPRING VAN, built for conveying Poultry to the exhibitions, but equally adapted for Plants.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King-Street, Covent Garden.

PINE CONES.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on SATURDAY, May 20, at 2 o'clock, 30 CONES of the PINUS SABINIANA, or Great Hooked Pine of California. These magnificent specimens are from 8 to 10 inches in length, and 14 to 15 inches in circumference, and are full of fresh seeds—about 200 in each. May be seen on the morning of Sale, and Catalogues had.

SPECIMEN AZALEAS.

STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on SATURDAY, May 20, at 12 for 1 o'clock, 50 AZALEA INDICA, Specimen Plants, from 3 to 4 feet high, in full bloom; varieties Lateritia, Gledstanesi, and Variegata, all grafted with two or three sorts on each. The property of H. LANE & SON, of Great Berkhampstead, who part with them for want of room.—May be viewed on the morning of Sale and Catalogues had.

CLAPHAM NURSERIES.

THE STOCK OF PLANTS OF THE LATE MR. JOSH. FAIRBAIRN.

MR. J. C. STEVENS is instructed by the Administrators to announce for Sale by Auction, on the Premises, on MONDAY, 22d; TUESDAY, 23d; and THURSDAY, 25th May, at 12 for 1 o'clock, without reserve, the first portion of the valuable Stock of Plants at the above Nurseries; it includes the Collection of Heaths, for which this establishment has been so long celebrated; fine specimens of Azaleas, Aphelexis, Epacris, and a general selection of Greenhouse Plants, all of which are cultivated in the best possible manner, and are in excellent health. They will be lotted to suit the Trade and private buyers.—May be viewed on Friday and Saturday before the Sale, and Catalogues had on the premises, and of Mr. J. C. STEVENS, 38, King Street, Covent-Garden; if for the country, by enclosing four postage stamps.

TO NURSERYMEN, FLORISTS, AND GARDENERS.

MESSRS. CRAWTER will Sell by Auction, at Garraway's Coffee House, Change Alley, Cornhill, London, on TUESDAY, May 23, at 1 o'clock precisely, without reserve, unless previously disposed of by private contract, the desirable Leasehold Estate, with possession, called PERCY CROSS NURSERY, in a commanding situation on the high road at Walham Green, Fulham, adjoining the mansion and grounds of Lord Ravensworth, comprising a convenient Residence, containing seven Rooms, Shop and appendages, Conservatory, Hothouses, Sheds, and other Buildings, with about 1 Acre of rich productive Nursery or Garden Ground.—May be viewed by application at the Premises, and particulars had 10 days before the Sale at Garraway's, the Inns in Fulham, and the surrounding neighbourhood; also of Messrs. Hanslip & Conworth, Solicitors, 12, Hatton Garden, and of Messrs. CRAWTER, Land-agents, Surveyors, &c., No. 5, Bedford Row, London, and Cobham, Surrey.

TO GENTLEMEN, FLORISTS, AMATEURS, ETC.

MR. WILMER will sell by Auction, on THURSDAY, May 25, at 1 o'clock, without reserve, a collection of TULIPS, the property of Mr. C. Woolnough, now growing in the garden Grounds of Mr. Selby, New North Road, Hoxton; also the Tulip Stage, with Iron Roof, Top Cloth and Rollers, Boxes, Irons, &c. Among the flowers are Shylock, General Jackson, Pompe Funebre, Man of Kent, Archer's Unique, Lucullus, Polyphemus, Mehemet Ali, Marshal Soult, Coronation, Walker's and Dixon's Dukes of Devonshire, Franklin's Superb, Glory, Invincible, Lord Brougham, Ariadne, Victory, and Favourite; Rose Camuze, Camuze de Craix, Greig's Rose, Bacchus, Emily, Goldham's Mary and Maria, Reine d'Espagne, Violet's Quarto, Precoce, Cook, Louis XVI., Godet Parfait, La Vandyke, Brulante Ecletante, Osiris, Timandra, Duc de Bordeaux, &c.—May be viewed two days previous and morning of sale. Catalogue on application to Mr. Tebbutt, Hoxton Nursery, New North Road; Mr. Pons, Swan Inn, West Ham; C. Woolnough, 6, Bateman's Row, Shoreditch; and of the Auctioneer, Sunbury, Middlesex.

SURREY.

STURTWOOD FARM, Newdigate, a Freehold Estate of 108 acres of superior Meadow and Arable Land, 6 miles from Dorking Station, about 8 miles from Reigate and Redhill Station; also BUILDING GROUND near Dorking.

MR. JAMES WHITE will Sell by Auction, at the Mart, London, on THURSDAY, June 1, at 12 o'clock, a desirable FREEHOLD ESTATE, Land Tax redeemed, called STURTWOOD FARM, situate at Newdigate, in Surrey, within two hours' journey of London, consisting of 108 acres, nearly one-fourth of which is excellent Meadow, lying in a ring fence, well Timbered, and comprising a large substantial Farm House, two Barns, Stables, Feeding Sheds and Yards, and other suitable Farm Buildings, and a Bailiff's Cottage on the Estate. One-half of the Farm has been tile drained. It is now in the occupation of the vendor, and immediate possession may be had. Also a piece of FREEHOLD LAND, containing 2 acres and 3 roods, situate on Bunt's Common, about three miles from Dorking, commanding a beautiful prospect, and offering a desirable site for the erection of one or more villas; and also another piece of FREEHOLD LAND, containing 1 acre and 21 perches, situate on Shellwood Common, about four miles from Dorking, and five miles from Reigate.—The above property can now be viewed, and particulars, with plan, may be had of C. J. Graham, Esq., Solicitor, 3, Plowden Buildings, Temple, London; at the Mart; and of the Auctioneer, Dorking, or by post.

HORTICULTURAL SOCIETY OF LONDON.—

The QUEEN having been graciously pleased to name Saturday, June 10, as the day on which her Majesty will open the Crystal Palace, Notice is hereby given that the Meeting of this Society, announced for the same day, will be held on SATURDAY, JUNE 3, instead of Saturday, June 10, as previously intended. All Tickets issued for June 10 will be available for June 3.—21, Regent Street.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

The First EXHIBITION OF PLANTS, FLOWERS, AND FRUIT, this season, will take place on WEDNESDAY next, May 24. Tickets of admission can be obtained at the Gardens by orders from Fellows of the Society, price 5*s.*; or on the day of Exhibition, 7*s.* 6*d.* each.

The Plants will be arranged on a new plan, similar in form to the American Garden, and placed upon a series of terraces.

Gates open at 2 o'clock.

VALE OF TAUNTON DEANE HORTICULTURAL AND FLORICULTURAL SOCIETY.

The FIRST EXHIBITION of the above Society will be held in the Vivary Park, Taunton, on WEDNESDAY and THURSDAY, the 21st and 22d days of June next. HANDSOME PRIZES will be awarded to Nurserymen.

The Society have resolved to hold, in conjunction with the same, a GRAND POULTRY EXHIBITION. Upwards of EIGHTY PRIZES will be given. Schedules for both Exhibitions and all further information may be obtained of the Honorary Secretary, Mr. JOHN KINGSBURY, 10, Hammet Street, Taunton, Somersetshire.

WEST KENT SECOND ANNUAL EXHIBITION OF POULTRY, &c., AND MISCELLANEOUS FLOWER SHOW

(Open to all England), under most distinguished Patronage, will take place in the Market Field, Farningham, on TUESDAY (private view), June 20, 1854, and following day. Subscription Tickets of Admission, available on both days, 5*s.* each. List of Prizes and Certificates of Entry for Poultry, &c., are now ready, and may be had on application, post paid, to the Secretary, B. THOMAS. For Schedules of Prizes for Flowers, &c., apply to Mr. ALFRED LOCKYER, Hon. Secretary, Farningham. The Entries will close on June 5. By Order of the Committee of Management,

BAPTISTE THOMAS, Sec.

MR. GEORGE USHER, formerly of South Dalton,

if he will communicate with his brother, Mr. J. USHER, of Appleby, will hear something to his advantage.

RENDLE'S IMPROVED SWEDE TURNIP.—

The Stock of this excellent Swede has been grown for us this season by R. H. Watson, Esq., Dorsley, near Totnes. It is a most hardy and valuable variety. Price 1*s.* 6*d.* *per lb. For further particulars and testimonials of its excellence see* "FARMING PRICE CURRENT," to be procured from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MORTON'S YELLOW GLOBE MANGOLD WURZEL,

saved by Thomas Bennett, Esq., Gloucester, from the Stock originally grown by J. C. Morton, Esq., the Editor of the Agricultural Gazette.

Seed of this most excellent variety can now be obtained from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, who have purchased the whole of the Stock.

TO TURNIP GROWERS.

SEVERAL New Sorts of TURNIPS, *of superior feeding properties, are described in* Messrs. SUTTON'S LIST, *which is given at the second page of last week's* GARDENERS' CHRONICLE (page 298.)

A Copy of Messrs. SUTTON'S Descriptive Priced List of Turnip Seeds may be had post free.

JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

SUTTON'S HARDY PURPLE-TOPPED SWEDE.

—Fine globe-shaped, with small top and one tap root, will stand the most severe winter, and is one of the best for storing. It was selected from the East Lothian Purple-topped Swede, but is larger. Price 1*s.* 4*d.* per lb., or 8*s.* per gallon.

A Priced List of other new Turnip Seeds will be sent, post free, on application, addressed J. SUTTON & SONS, Seed Growers, Reading, Berks.

NEW TURNIP SEEDS DIRECT FROM THE GROWERS.

WILLIAM E. RENDLE AND CO. have this season a very superior stock of all kinds of TURNIPS, and they recommend all who are in want of the best varieties to procure their "Farming Price Current and Agricultural Directory," to be had in exchange for six penny stamps.—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

DAHLIAS, GERANIUMS, FUCHSIAS, AZALEAS, BEDDING PLANTS, &c.,

EXHIBITION OF SPECIMEN PLANTS.

J. AND J. FRASER beg to invite the attention of the Nobility and Gentry to an inspection of their fine collection of Specimen CHINESE AZALEAS and other plants, which are now in bloom. The plants are so arranged in various Greenhouses as to have a similar effect to that produced at the Metropolitan Flower Shows. The collection comprises those specimens which have been exhibited so often at the Regent's Park and Chiswick Gardens, at which places they have taken the leading prizes.

The Nursery is about 15 minutes' walk from the Lea Bridge Station on the Eastern Counties Railway. Trains leave London at 9 a.m., 9.30 a.m., 10 a.m., 10.40 a.m., 12.30 a.m., 1.40 p.m., 2.30 p.m., 3.20 p.m., and 4.45 p.m.—Admission Gratis.

Lea Bridge Road, Essex, May 20, 1854.

EUGENIA OR MYRTUS UGNI.

MESSRS. VEITCH AND SON, of Exeter, and the Exotic Nursery, Chelsea, have much pleasure in offering to the Public the above beautiful evergreen flowering shrub, of THEIR OWN introduction, from Patagonia, through their collector, Mr. Wm. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by its Strawberry-flavoured red berries, eaten in Chili as dessert. It is a plant of easy culture, flowering in a very small state, when not above 6 inches high, and is well adapted for pot culture. It is figured by Sir Wm. Hooker in Curtis's "Botanical Magazine" for January, 1852.

Strong blooming plants, in 48-sized pots, 21*s.* each.
Second size do. in 60-sized pots, 15*s.* each.

With the usual discount to the Trade, and one over on either class when three are taken.—Exeter, May 20.

NEW SIPHOCAMPYLUS.

W. J. EPPS has much pleasure in offering the following, feeling they cannot fail to give the highest satisfaction. Strong plants are now ready for delivery.

SIPHOCAMPYLUS NE PLUS ULTRA—Very dwarf habit, with bright green foliage, producing flowers of the most brilliant scarlet in threes and fours at the axle of every leaf; the bes of the genus, 10*s.* 6*d.*

BICOLOR ROSEA—Deep crimson, tipped with pale rose, very distinct and beautiful, very dwarf and compact habit; 10*s.* 6*d.* The usual discount to the Trade.—Nurseries, Maidstone.

NEW VARIEGATED GERANIUMS, ATTRACTION AND SILVER KING.

JOHN AND CHARLES LEE are now sending out strong plants of these elegant novelties, which they can recommend as surpassing anything of the kind hitherto introduced.

ATTRACTION has a decided crimson horse-shoe, on a finely variegated foliage, which greatly enhances its beauty. The flowers are light scarlet. Price 10*s.* 6*d.* each.

SILVER KING is of a dwarf free habit, the leaves perfectly flat, with a very broad silver margin; flowers intense scarlet. Price 7*s.* 6*d.* each, or 70*s.* per dozen.

Nursery and Seed Establishment, Hammersmith, near London.

PLANTS FOR BEDDING OUT.

THE SUBSCRIBER is desirous of receiving Offers in the Trade, per 1000, for a Supply of the above, and other FLORIST FLOWERS for the Season.

WILLIAM SMITH, Aberdeen. May 20.

SOFT-WOODED PLANTS, in large variety;

suitable for decorating the Flower Garden during Summer and Autumn. To be had at low prices from the subscribers,

HUGH LOW & Co., Clapton Nursery, London.

BEDDING PLANTS, in pots, at 2*s.* per dozen.—

Geraniums, Scarlet; Do. Horseshoe-leaved; Do. Ivy-leaved. Salvia (blue), Heliotropes of sorts; Petunia Duplex, Shrubland Rose; Do. White. Fuchsia Voltigeur; Verbena White Perfection, Favourite, St. Margaret's. Strong plants, turned out of pots, 1*s.* 6*d.* per dozen. Calceolaria; Dark Fuchsia Globosa, Corallina, Gracilis; Salvia variegata, Ageratum, Cuphea, Heliotrope, Groundsel, Phloxes of sorts, and Pentstemons.

THOMAS PERKINS, HORTICULTURAL BUILDER, Atherstone, Warwickshire.

CAMDEN NURSERY, CAMDEN TOWN.

THOMAS ANSELL begs to inform the Trade and the Public generally, that he has a few plants on hand of his new and splendid Dahlia, "Mrs. Charles Dickens," a beautiful fancy; colour scarlet, tipped with pure white, of remarkable dwarf habit, and fine form. Price per plant, 10*s.* 6*d.*

EVERGREEN GRASSES FOR CHURCHYARDS, ETC.

SUTTON AND SONS have had the honour of supplying many Clergymen and others with Grass Seeds for Churchyards and Cemeteries, which have given great satisfaction. Price of Seed, 1*s.* per lb., or 18*s.* per bushel. From many similar letters we present the following :—

From Mr. C. Judd, Gardener to his Grace the Archbishop of Canterbury.

"The Grass Seeds received from you succeeded admirably, and, although sown late, the growth was such that we were enabled to mow the Churchyard in the autumn, and it has now the appearance of an established lawn of some years' standing; my employer, the Archbishop of Canterbury, is quite satisfied with its appearance."—Addington Park, January 7th, 1853.

NEW SEEDLING DAHLIAS.

N. GAINES begs to inform his Friends, both Amateurs and Nurserymen, he is now sending out his new SEEDLING DAHLIAS, viz., Alba Superba, Primrose Perfection, and King of the Yellows, at 10*s.* 6*d.* per plant. He can supply a quantity of his Dwarf Dahlias, Prince Arthur and the Dwarf; the two latter are well adapted for beds upon the lawn, not growing more than 18 inches high. He has a large quantity of Bedding Plants, such as Yellow Calceolarias, Tom Thumb Geranium, Verbenas, Petunias, Geranium Unique; Scarlet, White, and Crimson Fuchsias, Liliums, &c. His Show and Fancy Pelargoniums are now in flower, filling 10 houses, containing one of the largest collections in the country. May be seen gratis every day, Sundays excepted, at the Nursery, Surrey Lane, Battersea.—May 20.

BEAUTIFUL NEW BEDDING PLANT.

MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour abright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s.* per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

SEEDS TO IRELAND.—*Plymouth is admirably situated for supplying our sister country with some English Seeds. The Subscribers can refer to some of the leading families in Ireland, who have for many years obtained the whole of their supplies of Garden and Farm Seeds. Seeds delivered free to many of the Irish ports. See Price Current.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

DILLISTONE AND CO. beg to offer the following:—

STRAWBERRY PLANTS.—Ten of the best kinds always on hand, 2*s.* 6*d.* to 3*s.* 6*d.* per 100.

HOLLYHOCKS saved from 20 of the best named kinds, and kept separate, 3*s.* per dozen; 20*s.* per 100.

BEDDING PLANTS.—Many thousands will be ready in May, 3*s.* to 6*s.* per dozen, or cheaper if 100 are taken.

ROSES.—Tea, Bourbon, and Hybrid Perpetuals, and new ones, on the Manetti stock.

HERBACEOUS PLANTS, fine and good, 20*s.* to 30*s.* per 100.

Orders above 20*s.* paid to London. Lists upon application, enclosing a stamp.—Nurseries, Sturmer, Halstead, Essex.

ABRAHAM STANSFIELD, NURSERYMAN, SEEDSMAN, and LANDSCAPE GARDENER, Todmorden, Lancashire, having a large Stock of the following, can supply them at the under-mentioned prices:—

50 species of the genus SAXIFRAGA, at 15*s.* per 100, or 4*s.* per dozen.

400 species of select Plants adapted for Rockwork, at 30*s.* per 100, or 4*s.* per dozen.

800 species and varieties of Alpine and Hardy Herbaceous Plants, 25*s.* per 100, or 4*s.* per dozen.

150 species of Hardy and Greenhouse FERNS and LYCOPODS, from 6*s.* to 24*s.* per dozen.

SCARLET GERANIUMS and other Bedding Plants, 4*s.* p. doz.

N.B. A few bushels of genuine Fluke Potato, at 8*s.* per bushel.

Catalogues on application.—A remittance or reference from unknown correspondents.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to send out the following new plants:—

		s.	d.
FUCHSIA.—Monarch	... ...	10	6
GLOXINIA.—Duke of Wellington	... ...	7	6

The Set, 42*s.*

The above twelve distinct Verbenas have been Bedded out and proved the second season; the raisers are Messrs. Banks, Stewart, and Fozard. For descriptions of the above New Plants see back numbers of this paper.—May 20.

VANDA CŒRULEA.

MESSRS. MAULE AND SONS having received, the two last seasons, from their collector in the district of the Khasia Hills, a good supply of this most beautiful and charming Orchidaceous Plant, which stands unrivalled amongst the family of Vanda, from its abundant blooming, easy culture, great length of flower spike, and large number of blooms, which are of the most brilliant sky blue, lasting a long time in beauty, flowering from September until January, and in every respect is a first-class Plant of the justly admired tribe of Orchidaceous Plants. There is little doubt that this Plant after cultivation will flower at almost every season, as V. suavis, tricolor, &c. They have also received other esteemed kinds from this of Flora's favoured district of India, which they at the same time offer.

VANDA CŒRULEA 21*s.*, 42*s.*, 63*s.*; a few extra large, 105*s.*
AERIDES affine or roseum ... ... 21*s.*, 42*s.*, 63*s.*

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

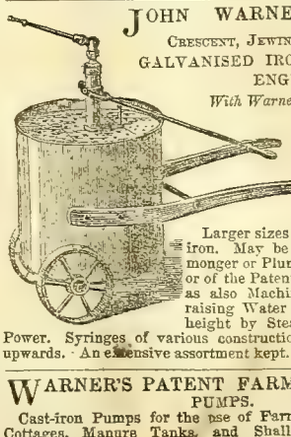
EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDE ENGINE,

With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

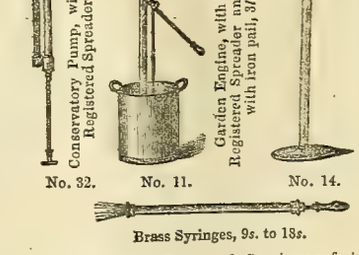
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27s. 6d.
Garden Engine, with WARNER'S Registered Spreader and Wrench 31.; with iron pail, 3l. 12s.
Patent Conservatory Pump, with WARNER'S Registered Spreader, 24. 13s.; with iron pail, 3l. 5s.

No. 32. No. 11. No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

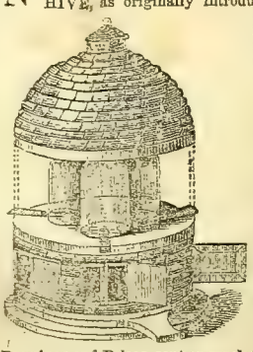
Sheets of Engravings sent on application.

BEES AND HIVES.

MARRIOTT'S HUMANE COTTAGE BEE-HIVE, for taking honey without killing the Bees, is the best for practical use. Newly illustrated Catalogue forwarded for penny stamp.—MARRIOTT, Apiarian, Surrey Zoological Gardens; City Warehouse, 24, Fish Street Hill, London Bridge.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



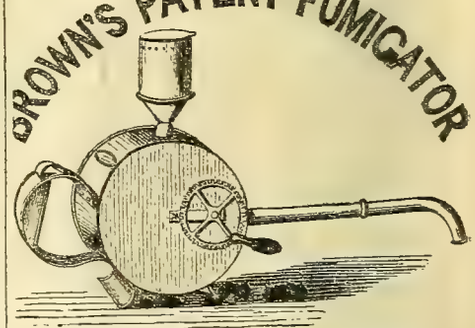
This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

PRICE TEN SHILLINGS AND UPWARDS.

CROWN'S PATENT FUMIGATOR



A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air more effectually, in conjunction with SANGSTER'S FLORUMBRA, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing to 112, Regent Street, London.)

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws	30	feet	high	...	£4 10
No. 2 „ 15 „	„	45	„	...	5 10
No. 3 „ 28 „	„	45	„	...	6 18

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws	25	feet	high	...	£2 15
No. 13 „ 12 „	„	30	„	...	3 5
No. 11 „ 16 „	„	40	„	...	4 0
No. 12 „ 24 „	„	45	„	...	5 0
No. 14 „ 30 „	„	45	„	...	5 18

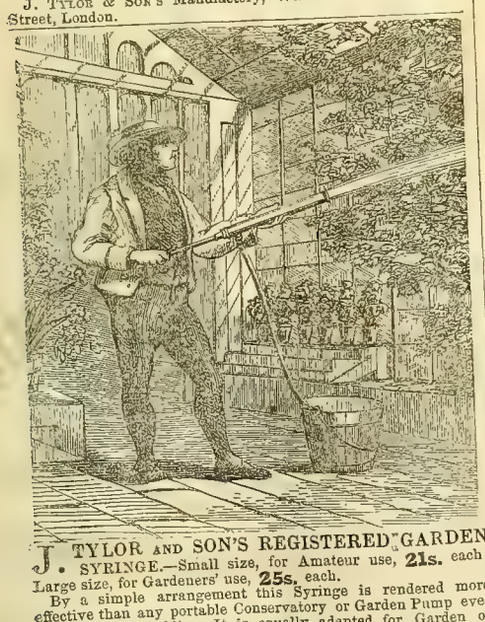
A large assortment of every description of Garden Syringes Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

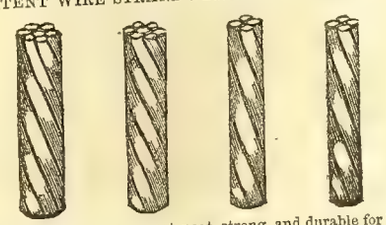
FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road, London.

IMPROVED WATERPROOF FLEXIBLE HOSE FOR WATERING GARDENS, AND AGRICULTURAL USES generally, at E. SPENCER & CO.'s, GENERAL WATERPROOFERS, 116, Fenchurch Street, opposite Mark Lane, London.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.

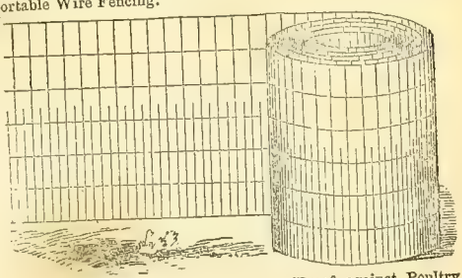
Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. Fox, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

AGRICULTURAL AND POULTRY FENCING, MANUFACTURED BY PATENT MACHINERY.

The great increase in the number and quality of POULTRY in the United Kingdom within the last few years has created a demand for an efficient Poultry Fence, which has called into existence every possible contrivance and adaptation of the Wire and Cord Netting, all of which have more or less proved failures.

B. GREENING & CO. have succeeded in supplying this acknowledged deficiency, by the introduction of a variety of their Portable Wire Fencing.



No. 11. PATENT DOUBLE FENCING (Proof against Poultry and Chickens).

This Fencing (which they manufacture by machinery, patented last year) is light, portable, and elegant in appearance, yet stronger and more durable than any Fence before the public. It requires few standards, and is fixed with the utmost facility by a labourer or gardener.

The following are the principal other varieties:—CATTLE FENCING, SHEEP AND LAMB FENCE, HARE AND RABBIT PROOF FENCING, ORNAMENTAL FENCING FOR GARDENS, TRAINERS FOR PEAS, GARDEN BORDERING, EXPORT FENCING, &c. &c., manufactured by Patent Machinery by BENJAMIN GREENING & CO.

1 and 3, CHURCH GATES, and 2, CATEATON STREET, MANCHESTER,

From whom every information, together with Prospectuses and Engraved Sheets of Patterns, may be obtained gratis.

THE SECOND CERTIFICATE.

1. To Messrs. Jackson, of Kingston, for Clematis monstrosa.
2. To Mr. Busby, Gardener to J. Crawley, Esq., F.H.S., for Oncidium Papilio.

HONEYSUCKLE VERBENA.—So named for its delightful perfume, which is so near the odour of the Honeysuckle that it cannot be distinguished from it. Last season it was the constant inquiry of visitors at the Nursery Grounds if Honeysuckles were growing near, or what flower so much resembled them in fragrance, and on being informed it was the above new variety of Verbena, they were much surprised, and immediately ordered plants of it. Description—viz., compact habit, fine glossy foliage (will do excellently for bedding, or as a plant for pot culture), long stems to flowers, making it very useful for bouquets—blooms most abundantly; colour rich dark crimson, shaded lilac, very distinct eye; the truss of a fine globular shape, generally measuring 9 inches in circumference, all the pips fully expanded. It will force well during the winter, being a great advantage for cutting, or for its perfume in a greenhouse or conservatory at that season of the year; it will also stand the sun and rain during summer better than any other Verbena. A few blooms added to a bouquet will give it the scent of the sweetest Honeysuckle. Fine strong plants are now ready for sending out, at 5*s.* each.

LOBELIA LINDLEYANA.—The subscriber having purchased the whole stock of the above new Lobelia of Mr. Keynes, Salisbury, he begs to offer it to the public. It was awarded a Certificate of Merit at the Horticultural Society and National Society of London, June 1853. Description—viz.: Habit, dwarf and compact, flowering very freely, covering the whole surface of the plant; distinct in colour from all others yet out, being a bright rosy lilac. It is an excellent bedding variety, and will be sure to please every one who grows it, especially for its distinct colour and profusion of bloom. Strong plants now ready at 3*s.* 6*d.* each.

The usual allowance to the Trade when three plants of either are ordered. On receipt of a post-office order or penny postage, stamps to the amount, the plant or plants will be sent postage and package free.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.—May 20.

TURNIP SEEDS! TURNIP SEEDS!

ARTHUR HENDERSON AND CO. take the earliest opportunity of informing their friends and the public, that their CATALOGUES No. 3 and No. 6 are now ready, and can be had, post free, upon application.

No. 3 contains descriptive lists of Geraniums, Verbenas, Fuchsias, Calceolarias, Cinerarias, Chrysanthemums, &c., amongst which will be found all the best novelties of the season, also the choicest selections from former years.

No. 6 contains descriptive lists of all the newest and best Stove, Greenhouse, and Hardy plants, amongst which will be found many new and desirable plants.

The following new plants are now on sale:

SEEDLING GLOXINIAS.

ELEANOR.—Ground colour pure white, blotched with rose, and shaded with purple.

ELEGANTISSIMA.—Ground colour French white, of great substance, centre pale lavender, spotted with buff.

EUGENIE.—Ground colour, rosy pink, centre creamy white, spotted with rose.

EXQUISITE—Ground colour pure white, with broad belt of puce, throat creamy white, spotted with puce.

MAGNET.—Ground colour clear rose, with blotch of purple in the throat, flowers large, of fine form.

PRINCE OF WALES.—Ground colour white, shading off to lavender.

SIR C. NAPIER.—Ground colour deep rosy crimson, throat blotched with intense rose, dwarf habit.

The above seven Gloxinias will all be found to be fine varieties, with large well-formed flowers standing well up above the foliage. 7*s.* 6*d.* each, or 42*s.* the set.

CINERARIA EVA.—Ground colour pure white, with narrow margin of purple, dark disc, fine form and substance; received a Certificate at the National Floricultural Society. 10*s.* 6*d.*

GERANIUMS.

DIADEMATUM REGINA.—Ground colour deep shining rose, upper petals veined with dark purple and white, with blotch of bright orange crimson; very dwarf habit, and abundant bloomer; a fine variety for bedding. 7*s.* 6*d.*

DIADEMATUM SIDONIUM MULTIFLORUM.—Lower petals rosy purple, shaded with crimson; upper petals orange crimson, veined with dark maroon; trusses large, habit dwarf and compact, abundant bloomer; a fine variety for bedding. 10*s.* 6*d.*

PRINCESS.—Ground colour blush white, veined and shaded with carmine, dark horse-shoe foliage, large globular-shaped trusses, and most abundant bloomer. 7*s.* 6*d.*

CETERACH MARANTA (syn. Nothoclena maranta).—A new hardy Fern from the Alps of Switzerland; fronds bipinnate, about 8 inches in length, densely coated with golden brown scales on the under side. 15*s.*

Pine-apple Place, London, May 20.

CAPE HEATHS AND NEW AZALEAS.

W. J. EPPS begs to call attention to his extensive and rare Collections of Heaths and Azaleas, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c. AZALEAS—Prince Albert, Gledstanesi, Excelsa, Murrayana, Alba magna, Duke of Devonshire, Holderi, Toilette de Flora, Glory of Sunning Hill, Symmetry, Splendens, Ignescens, &c., &c., 9s., 12s., 18s., and 21s. per dozen; 5l. per 100 varieties, carriage paid to London. All the new Stove and Greenhouse Plants, Fuchsias, Verbenas, and Roses, equally moderate. Catalogues of the above sent on application.—Nurseries, Maidstone and Ashford.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidenee, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introdueed by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21s.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21s.

PAGE AND CO.'S

LIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. 4s. per gallon, sufficient to make four. For testimonials see back leaf *Gardeners' Chronicle*, March 11, 1854.

GARDEN AND AGRICULTURAL SEEDS, first quality, and lowest market price.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

GRASS SEEDS, ETC.

THOMAS GIBBS AND CO. (the SEEDSMEN to the Royal Agricultural Society of England), corner of HALF-MOON STREET, Piccadilly, beg to draw attention to their Grass Seeds for Laying down Land to Permanent Grass. The Seeds which they employ in forming the Mixtures for various soils are well cleaned under their own superintendence.

Mixtures for Permanent Meadows and Pastures
" Parks or Pasturage in sight of Mansions
" Irrigation on Water Meadows
" Renovating Old Swards
" Fine Garden Lawns, Cricket Grounds, &c.
" two or three years' lay.
RYE-GRASS—Italian, very fine sample
" Dickinson's Italian do.
" Pacey's Perennial and Evergreen
" Annual or Common.
CLOVERS—Red, White, and Alsike
" Trefoil, Red Suckling, &c.
CARROTS—Large White Belgian
" Field, Altringham, &c.
MANGOLD WURZEL—Long Red
" Orange or Yellow Globe, and other sorts.
TURNIPS—Swedes, Purple Top, Skirving's, &c.
" Hybrids, Gibbs' Green Top
" Globes, Tankards, &c.
FARM SEEDS of all descriptions.

Priced Lists, Detail Catalogues, and other information can be obtained on application to THOMAS GIBBS & CO.

SEEDLING VERBENAS.

W. J. EPPS has great confidence in recommending the following Seedlings, raised by Mr. Philpot, of Aldington, being without exception the most distinct and splendid flowers in their class yet offered to the public. The following are the opinion and description given by Mr. Neville, editor of the *Gardeners' Record;* they were exhibited at Ashford open Show, in September last, and received first-class certificates.

No. 1. SULTAN.—Dark velvety maroon; large white eye; petals stout; pip, full size; truss, medium; a beautiful variety.

No. 2. BLUE BELL.—Dark velvety blue, with white eye; truss very large and well formed.

No. 4. INDIAN CHIEF.—Crimson puce, very rich in colour; yellow eye; very attractive.

No. 5. DELICATISSIMA.—Pale lavender, with large primrose eye; very beautiful and novel; petals, stout; pips, well formed; truss, medium.

No. 8. RUFUS.—Plum colour purple; velvety texture; dark disc; with a clear white margin; immense flower and trusser.

No. 20. DISTINCTUS.—Cherry lavender grey disc; distinctly margined with dark crimson purple; fine bold truss and large flowers.

The whole of the above are exceedingly free flowering, and excellent habits — well suited for bedding or other purposes: 12s. 6d. the collection.

SEEDLING PHLOXES.

These are, without exception, the most lovely things in their way possible; they have been much admired by all who have seen them, and have merited the high opinion of the editors of the leading floricultural works. The following is the description from the *Gardeners' and Farmers' Journal*, Sept. 21st, 1853:—

"SEEDLING PHLOXES.—The collection of Seedling Phloxes received is remarkable for novelty and superiority of form.

No. 1. MARIA.—Rose peach, with white eye.
No. 3. ASTROSANGUINEA.—Fine crimson.
No. 4. DISTINCTUS.—Light purple, white eye.
No. 5. CARMINATA.—Deep rose, white eye.
No. 7. SPLENDENS.—Large lilac, white eye.
No. 8. CONSPICUA.—Very deep rose, white eye."

10s. 6d. the collection.—Nurseries, Maidstone.

The Gardeners' Chronicle.

SATURDAY, MAY 20, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, May 23—Horticultural ..... 3 P.M.
WEDNESDAY, — 24 { Linnean (Anniversary) ..... 1 P.M. / Royal Botanic Gardens ..... 2 P.M.

COUNTRY SHOWS FOR THE MONTH OF MAY.—23d: Handsworth and Lozells.—24th: Nottingham and Colchester.—25th: Derby.—26th: Bury St. Edmunds.—29th: Hunslet.—30th: Truro.

NOTHING could be more brilliant than the EXHIBITION of FLOWERS and FRUIT at CHISWICK last Saturday. It was a beautiful day, and four or five thousand visitors would have been present had not the presence of the Queen at Woolwich carried off all except 1764. To those who did attend, the exhibitors offered a eal treat. Such Roses and such Azaleas have rarely been seen; and when it is stated that those two classes nearly filled the largest tent on the ground, it will be understood that that part of the exhibition must have been a terrestrial paradise. The Orchids were abundant and excellent, notwithstanding the absence of Mrs. LAWRENCE and Mr. RUCKER; and the greenhouse plants, especially those from Lady ANTROBUS, were models of cultivation. Let us hope that huge unwieldy plants will be seen no more; for they cost so much for carriage, and are in all respects so inferior to beautiful specimens like those of Mr. GREEN, that exhibitors will surely now discover that it is entirely contrary to their interest to persevere in their production.

The new arrangements for rewarding fruit have evidently found favour among gardeners; for no May show in our remembrance has produced so great an abundance of such remarkable excellence.

Novelties among plants were few. The most striking was a new salmon-coloured *Indian Rhododendron*, in the way of javanicum, produced by Messrs. VEITCH, and a very fine thing. The next was the woolly-stemmed *Cypripedium villosum*, from Borneo, from the same great importers; and third in merit was a species of *Hedaroma*, called by the ambitious title of *Genetyllis tulipifera*, of which a detailed account appears in another column.

We may add that the general effect of the exhibition was greatly improved by the absence of some unimportant classes of plants, to which, in previous years, undue prominence was given. This change, brought about by an attempt on the part of a little clique of exhibitors to climb into consequence upon the shoulders of the good old race of sterling gardeners, enabled the Society to reward more amply those plants which most deserve encouragement, and in which English gentlemen more especially take interest. It was a pitiable sight to behold some of the authors of this abortive intrigue wandering round the brilliant tables, like DANTE'S souls in Purgatory,

> ———poor and wretched ones!
> That, feeble in the mind's eye, lean their trust
> Upon unstaid perverseness.———Their blind life
> So meanly passing, that all other lots
> They envy.

It is to be hoped they will find contentment in another place.

OUR reason for bringing once more into prominent notice, a few weeks since, the contrivance called a WARD'S CASE was not so much to point out its real but only value, as to found upon it some considerations having a general bearing upon cultivation under glass. Of course we mean by "cultivation" the preservation of plants in the most perfect health, and in the most entire possession of all their functions.

Old gardeners committed the grievous fault, among many others, of neglecting the atmosphere of their houses. Their notion was that a greenhouse was to keep plants warm, and a hothouse to keep them hot. These conditions secured, their duty seemed to be accomplished. Light itself did not enter much into their estimation; and that was fortunate. It is doubtful whether they knew that air held moisture suspended in the form of invisible vapour; at all events they proceeded as if it were beneath a thought.

At last Professor DANIELL and others drew attention to the great fact, not merely that the atmosphere is everywhere more or less charged with moisture, but that differences in the amount which is present constitute some of the most important distinctions between climates and seasons; and moreover that tropical vegetation, more especially, demands at certain times an atmosphere in almost a state of saturation. Then arose, among the intelligent class of cultivators, the question how the air was to be maintained artificially in such a condition. Recourse was had to syringing, to shutting up houses, and deluging their soft tiled floors with water, or to loading the flues with evaporating pans; and in this way, a wonderful change was speedily wrought in the aspect of exotic vegetation under glass.

Results so satisfactory appeared to sanction the idea that the great conditions to attend to in hothouse cultivation were heat and moisture. And it was believed by many growers, of repute in their day, that the WARD'S case would render those conditions more easy to fulfil than any plan previously discovered. Accordingly, houses were constructed in imitation of WARD'S cases; care was taken to make them what men called air-tight; sashes were fixed, and doors were opened with as much caution and infrequency as if they led to a treasure vault. It was, however, found, before long, that we had sailed from Scylla to Charybdis. Plants were no longer roasted, indeed, but they were par-boiled; desiccation ceased to be a great horticultural blunder, but its place was taken by humefaction; plants did not shrivel and shrink up from want of water, but they swelled and rotted from excess; dropsy succeeded thirst; and the ancients laughed in their sleeves at the innovators.

But here, as in all things else, a middle course was found better than extremes. If the WARD'S house turned out a failure, it only became so by applying a sound principle unskilfully. It was no mistake to say that heat and moisture were alike necessary to plants; that remained incontestable; but it was a grand mistake to suppose that heat and moisture, however skilfully proportioned, were sufficient. We might have known that by a more exact investigation of natural phenomena. Nature no more causes plants to grow in half air-tight rooms than amidst rays of coloured light. In the natural world vegetation subsists in its greatest activity in the presence of white light; red light, and yellow light, and blue light are unknown; and if green light occurs, it is only in the recesses of deep forests, where little is to be found except fungi, or Mosses and Ferns. So it is with unventilated places; they are the exception to the natural law, which declares that living things shall have access to air. The lowest orders of animals and the lowest of plants thrive indeed in such localities, for all places seem to have their allotted inhabitants; but the great world of vegetation knows of no healthy existence except where the air moves freely around it. In suffocated places we find lean and sickly races, too weak to stand alone, and struggling to reach a better atmosphere; these places are the WARD'S cases of the wilderness; natural accidents from which all things endeavour to escape. But it is in the open plain, or the exposed hill side, that vegetation most robust and rude in health is produced by nature.

Hence the true principle of plant management is in diametrical opposition to that observed in the construction of a WARD'S case. The last depends on the exclusion of air; or at least the maintenance of air in a state of perfect quietude. The first rests upon the freest possible admission of air, and upon the continual presence of all those rapid currents which exist everywhere in the open fields. It must be admitted, indeed, that this natural condition is not always observed; at present we want the art of maintaining the air of plant houses in a state of perpetual ingress, egress, and interior motion. But it is certain that the health of plants improves in proportion as the condition in question is fulfilled, and *vice versâ*. The fault of bad gardeners is their not attending to it; the defect of good gardeners is that even they neglect it more than is necessary in the present imperfect state of the mechanical contrivances with which they work. But the day will come when there will be no difference as to motion between the interior and exterior atmosphere of plant houses: and then men will look back with wonder at the delusion which led them to act upon the principle of a WARD'S case.

IN the scramble after novelties there is a risk that one of the most valuable of the exotic Coniferous trees grown in Europe may be forgotten. It would be interesting to know what proportion the sale of the GINGKO TREE, or SALISBURIA ADIANTIFOLIA, bears to that of such plants as Taxodium sempervirens. We suspect that the demand for it is almost nothing, judging from the very few places in which it is ever seen. And yet it is a noble tree, of singular as well as beautiful aspect, as hardy as a Poplar, and, when old, of gigantic stature. Its only fault is being deciduous. Here and there large trees may be met with, looking in mid-winter like vigorous Pear trees. But to growers in general the plant is scarcely known.

An interesting account of the tree as it now exists near Montpellier, for which we are indebted to M. CHARLES MARTINS, has drawn attention once more to the peculiarities of Salisburia, and we hasten to avail ourselves of some of his facts.

In Japan, of which it is a native, as well as of some of the coldest parts of China, it is looked upon as a kind of Walnut, and acquires very considerable dimensions. A specimen, growing by a Pagoda in the neighbourhood of Pekin, is recorded by the Russian traveller BUNGE to measure 13 yards in circumference, and to have a prodigious stature. In the Botanic Garden of Pisa is one about 25 yards high, and a yard in diameter at its base; and near Montpellier grows another, of which the following is the history, abridged from M. MARTINS' report.

In the year 1788 BROUSSONET, who was then in London, sent to Prof. GOUAN, of Montpellier, a plant of this species, for which he was indebted to Sir JOSEPH BANKS. In 1812, 24 years after being planted, the tree flowered. At that time it was 9½ yards high. In June, 1835, it was rather more than 17½ yards high. On the 7th December, 1853, its stature was determined by careful measurement to be 19¾ yards, or a trifle more. From this it appears that it lengthened on an average not quite

a foot annually; but it in reality grew nearly three times as fast in the first 47 years as in the last 18.

The spread of the branches was rather more than 7¾ yards in 1812, 11¼ in 1835, and 14½ in 1853.

The diameter just above the roots increased at the following rate:—

In 1788 it was	3	millimetres	(1 year old).
In 1812 „	239	„	„	(29 years old).
In 1835 „	605	„	„	(47 years old).
In 1853 „	887	„	„	(65 years old).

In another case, in the Garden of Plants at Montpellier, a Salisburia gained in 58 years a diameter of 672 millimetres.

The annual growth of the first in diameter is thus seen to have been about 13.64 millimetres; that of the second to have been about 11.6.

In comparing this rate of growth with what has been observed in other Conifers, M. Martins records some very interesting facts. In the Botanic Garden of Montpellier, within a hundred yards of the last named Salisburia, grew a noble Spruce, which had been planted in 1688. Circumstances led to the removal of the tree when 160 years old. A round of the butt having been preserved, showed that its diameter had increased thus:—

When 24 years old its diameter was				152	millim.
„ 47	„	„	„	272	„
„ 58	„	„	„	316	„
„ 65	„	„	„	350	„

It therefore had not grown half so fast as the first Salisburia mentioned above.

The Scotch Pine (Pinus sylvestris) affords similar means of comparison. We here translate M. Martins literally:—"In every latitude comprehended between 49° and 70° N., that is to say, from Haguenau on the lower Rhine, as far as Kaafiord in Lapland, the annual layers of the Scotch Fir diminish in thickness from the centre to the circumference. This decrease is rapid, in proportion as the trees are more and more northern. As a term of comparison, I give below, in millimetres, the mean thickness of the layers, up to 100 years, of a large number of Pines observed at Kaafiord, in Finmark (lat. 70°); at Pello, in Lapland (lat. 67°); Geffle, in Sweden (lat. 61°); Halle, in Germany (lat. 51°); and Haguenau, in France (lat. 49°).

At Kaafiord the mean annual thickness of the layers of wood is ...	0·0009 m.
Pello	0·0011
Geffle	0·0018
Halle	0·0019
Haguenau	0·0032

The mean thickness of the two Salisburias above referred to being 0·0065 m., it is clear that they grow much more rapidly than the Scotch Fir, even in Haguenau, in the climate of Alsace. It would be a great mistake to suppose that there is no parallel between the growth of the Scotch Fir in the north of Europe and that of Salisburia at Montpellier. In reality, it is in the middle of Sweden that the Scotch Fir attains its greatest magnitude. Near Geffle and Upsal, the tree becomes colossal, because it finds itself in a climate that suits it. The summer is, however, too short to enable the annual layers of wood to gain great thickness, and in winter, vegetation is totally suspended."

Thus, facts seem to show that Salisburia deserves to be much more generally cultivated than it is. According to M. Martins, and others, the wood is dense and strong—not unlike that of the Orange tree, and by no means resinous; and when the female trees have a male branch grafted upon them, which is easily done, they produce their fleshy fruit in abundance, which, if not of value for useful purposes, have, at least, the merit of being ornamental.

The following members of the House of Commons have been appointed a select committee to enquire into the propriety of selling some of the Royal Forests, and into other matters connected therewith:—

Henry Drummond, Esq., member for West Surrey.
Lord Edward Howard, member for Arundel.
Colonel Clifford, member for Hereford.
Right Hon. R. Vernon Smith, member for Northampton.
Henry C. Compton, Esq., member for South Hants.
Lord Harry Vane, member for South Durham.
W. R. S. V. Fitzgerald, Esq., member for Horsham.
The Earl of Shelburne, member for Calne.
Melville Portal, Esq., member for North Hants.
John Evelyn Denison, Esq., member for Malton.
Chichester S. Fortescue, Esq., member for Louth, and a Lord of the Treasury.
Lord Hotham, member for East Yorkshire.
The Hon. H. Brand member for Lewes.
Sir William Heathcote, Bart., member for Oxford.
John Tollemache, Esq., member for South Cheshire.

Pending the sittings of the committee it is our intention to abstain from editorial remarks upon the disputes connected with these possessions of the Crown. But we must take this opportunity of directing the attention of the Committee to a letter in another column from Mr. Brown, who, as we anticipated, refuses to acknowledge the truth of the report made by the referees of the Treasury, and offers to prove on the ground the substantial exactness of his own statements. We are persuaded that the House of Commons will never permit an honest man to become the victim of what the *Press* does not hesitate to call "a base intrigue," because he chances to be unbefriended.

VEGETABLE PATHOLOGY.—No. XX.

86. Except in a very early stage of growth, and at the very tip of the young stem or branchlet, the tissue of the bark is perfectly distinct from that of the wood; before, however, this distinction takes place, and while the vegetative apex consists of one uniform or nearly uniform parenchymatous tissue, little swellings, more or less symmetrically arranged, are given off from the sides, either on one side only, or, in the case of sheathing leaves, all round the nascent stem, which by their expansion and the addition of new swellings at the sides, in various orders of development, produce the organs known by the name of leaves, whether really such, or assuming their form and functions.

87. These swellings at first consist of the same nearly uniform tissue as the vegetative apex, and are formed previous to the existence of any vascular tissue; nodules, however, spring from the main vascular fascicle, or are in contact with it, as seen in the figure under No. 76, which ultimately extend into the young leaves, and by their ramification produce nerves. Many fascicles frequently enter into the same leaf, being often symmetrically arranged, as is very visible on a careful examination of the scars left by fallen leaves, or cross sections of their petioles.

88. The parenchymatous tissue of the leaf is therefore a direct continuation of the young green bark, while the vascular tissue is in connection with that of the young wood or medullary sheath, and is accompanied by elongated tissue derived from it, though frequently more or less modified. As new leaves are only formed on the youngest parts of plants, their vascular fascicles must be evidently in more or less intimate connection with the pith, which sometimes penetrates the petiole, and be most favourably placed for the absorption of the ascending sap. The normal buds, too, must clearly be in direct communication with the pith. Where, therefore, the buds are formed on the surface of the medullary sheath, though remaining latent for a longer or shorter series of years, the fascicles which supply the leaf may be traced down through several annual rings of growth quite down to the pith; but in the case of adventitious buds this connection cannot always be traced.

89. Leaves have constantly one or more buds in their axils, which may or may not be developed; though, however, they may remain latent for years, especial circumstances may call them into action. Buds so produced must not be regarded as truly adventitious, but as deferred developments of already existent organisms.

90. Leaves, then, consist of parenchym, frequently presenting enormous intercellular cavities, and composed of cells very variously arranged, and of very different characters, threaded and traversed by fascicles, often branched and anastomising, of vascular and elongated cellular tissue. The cells on the upper side are generally arranged vertically, while those of the lower side affect a more horizontal position, with, however, very various conformation, the whole being covered with a very thin but highly resistent membrane, which is known by the name of cuticle. Beneath this there is generally a stratum, or occasionally more than one layer, of vertical cells. Both are perforated by little apertures, but more especially the lower surface, which are known by the name of stomates. In some cases, as in Alstrœmeria, where the true upper surface has the ordinary structure of the lower side, the anomaly is remedied by a twist of the petiole, by which the upper becomes the lower surface. The respiratory and evaporative powers are in direct relation with the number of stomates; plants, therefore, which inhabit arid exposed spots, and which are obliged in consequence to economise their provisions, have but few stomates, with a thick impervious cuticle; while those which live in the shade, and in the midst of abundant moisture, have a thin delicate cuticle and abundant stomates. Modifications, of course, occur, but the normal condition is much as stated above. It will be found also that the stomates are comparatively small in succulent plants. In many instances where true leaves do not exist, or if so are reduced to very minute dimensions, their functions are performed by the stem, which is furnished with stomates. *M. J. B.*

LEPTOSPERMUM GRANDIFLORUM.

This plant is easily managed, and is a very free bloomer, producing its prettily-shaped white blossoms for many weeks in succession. Persons intending to commence its culture should procure a good healthy young plant, having strong, close-jointed shoots. It will cost but a trifle, and to propagate it from cuttings would require more time and attention than the saving is worth. It is, however, easily propagated by means of cuttings treated in the same way as those of greenhouse plants generally, and, with proper attention, nice little plants will be obtained in the course of two seasons. If plants, however, are obtained from the nursery at once, they should be placed in a cold frame, which will be the most suitable situation for them during the summer, as their wants will be much more easily supplied here than in a greenhouse. If on examination the pots are found to be moderately well filled with healthy roots, shift at once into others, one or two sizes larger, being guided in this by the vigour of the plants. The ball should be in a moist state at the time of shifting, as also the soil to be used. As newly potted plants are more liable to suffer from the careless application of water than at any other stage of their growth, this must be carefully administered till the roots strike into the fresh soil. The safest way of avoiding either excess is to sprinkle the plants over-head morning and evening, keeping the atmosphere rather close, and shading on the forenoons of bright days. If all goes on well the roots will have got hold of the fresh soil in the course of about a fortnight after potting, but this will be readily known by the increased vigour and active growth, and where this is the case, air must be freely admitted, to prevent weakly growth, keeping the atmosphere as moist as can be done. A slight shade on the forenoons of bright hot days will be very beneficial, but this should not be over done.

As the plants advance in growth, attend to regulating the shoots, stopping and training them as may be necessary to secure close compact specimens of the desired form. Where the plants have become well established after potting, they will be greatly benefited by exposure to the night dews on mild warm nights, but they should be protected from drying winds or heavy rains, and the lights should be replaced every morning, and the plants syringed over-head, in order to secure a moist atmosphere. Inure the young plants to full exposure to air and sunshine from about the middle of September, so as to get the wood well ripened before the occurrence of damp foggy weather, and remove them to a light airy part of the greenhouse in time to avoid their being injured by damp or frost. Water carefully during winter, but give enough to keep the soil in a properly moist state, and keep the foliage free from dust, &c. The plants may be encouraged to make growth early in spring, by placing them near the glass, in a house where the temperature may be kept at about 45° by fire-heat, allowing it to rise some 10° with sunshine and air. Attend to shifting as may be necessary, to afford the roots plenty of space, and otherwise attend to the plants as directed for last season, taking care not to subject them to too much artificial heat, and to secure close strong growth; and if all goes on well they will be nice-sized specimens by the end of the growing season. The flowering season is May, and while in bloom they should be screened from bright sunshine, in order to prolong the duration of the flowers. After blooming examine the plants and shift into larger pots if necessary, and also stop and tie out the shoots in order to admit light and air amongst the branches and induce a close bushy habit. Let the plants remain in the greenhouse and treat them rather kindly until they get into free growth, when they may be removed to a sheltered situation out of doors, but care must be observed not to expose them rashly to the sun and wind, which would check their growth and cause irreparable damage.

Good rich turfy peat, nicely broken up into small pieces and liberally intermixed with sharp silver sand, forms the best soil for the growth of this plant. Care should be used in potting to secure perfect drainage, as the roots are very impatient of stagnant moisture. *Alpha.*

ENTOMOLOGY.

The Mite Destructive to Young Cotton Plants.

As any circumstance connected with the welfare of the Cotton plant, especially in its early state, is of importance at the present time, when attempts are being made, on an extensive scale, to grow it in our own colonies, so to render us independent, to a certain extent, of our transatlantic cousins, we are induced to publish a communication which we have received from the Rev. Henry Hare, of Carteshowle, Totnes, respecting the destruction of a crop of young Cotton plants by great numbers of minute insects, which we have ascertained to belong to a species of Acaridæ. Our correspondent says:—"I beg to enclose you a few seeds of the Cotton plant which I received two years since from New Orleans, being very desirous of raising the plant in my hothouse. I have found the seeds vegetate very rapidly, but no sooner are they above-ground than they are infested with insects which very speedily destroy them; it appears quite evident that these insects, or the ova from which they spring, were deposited in the seeds from their first formation in the pod of the Cotton plant. I have lately sowed some seeds in a hot-bed; some vegetated, some decayed—the latter I send you, on opening them you will find an infinite mass of living insects, which heat has brought to life, visible even by the naked eye, but a glass will show them most distinctly. The species of insect appears different from any I have ever seen, and it has occurred to me that your experience in such matters may enable you to form an opinion as to the character of these insects, and the

cause or origin of their existence in seeds the shell of which is too hard to allow of their entering it after being sowed in the earth. I send you a few seeds which have not been sowed, and on cutting them you will find the germ of the seedling leaf (which on first opening is exactly like the Beech) with some slight dark-coloured spots, which perhaps are the ova of these insects, which lie dormant until brought to life by the decay of the seed in heat; in those decayed pods which I have opened, the whole mass appears to be insects rolling over each other."

Unfortunately the insects were dead when the packet arrived, so that it is only from an examination of dried up specimens that we can determine the species. It however clearly belongs to the family of the mites Acaridæ, and to the restricted genus Tyroglyphus; and from the most careful examination which we could make of our materials, it appears to be either identical with, or very closely allied to, the Tyroglyphus farinæ (Acarus farinæ De Geer, Mémoires Vol. 7, pl. 5, f. 15), except that the body is shorter and more like that of the cheesemite (Tyrogl. Siro. = Acarus domesticus De Geer, tab. cit. fig. 1—8), our figure represents it very highly magnified (its natural size not being larger than a full stop), and seen on the under side. The mouth is short and pointed, formed of two divisions, below which is a strong forked muscle visible with reflected light, and

similar muscles run from the median line of the body towards the base of each of the legs, which are short and thick with very short joints, terminated by a hooked tarsus. The body is terminated by several long hairs, and there are a few hairs scattered on the legs, one on the upper side longer than the rest at the base of the penultimate joint.

The account given by our correspondent of the habits of this species of congregating in masses, the insects rolling over each other, agrees with those of the cheese and flour mites, but the question of their origin, and the fact of their devouring young growing plants, are deserving of considerable attention. Our correspondent's suggestions that the eggs from which they are produced were deposited in the seeds, and that the small brown specks visible on making a section of one of the latter are in fact the eggs, do not appear to us to be tenable. A microscopic examination of the seed (see magnified figure) shows these spots to be irregular both in size and shape, and to be a portion of the texture of the layers of the embryo plants. On the other hand we know, from the observations of Lyonnet, that in hot weather these mites produce living young instead of eggs. But our correspondent himself seems to furnish an answer to the question under consideration, since he states that the seeds had been kept two years before they were sown, and it seems quite probable to us that during that period they had become infested with these mites in the cupboard or drawer where they had been deposited, the downy envelope of the seeds affording a shelter for them till planted, and even till the young plant had sprung up. But still we are met by the objection that the allied species do not attack growing plants, and we are even inclined to suggest that the mischief is attributable to some other animal. We can hardly, in fact, doubt that if this species of Acarus were the natural attendant of the Cotton plant, we should, long ago, have been made acquainted with its economy by some of the many observers of natural history in North America, where of course the greatest facilities must occur for such an investigation. *J. O. W.*

VINE MILDEW.

The mildew known by the name of Oïdium Tuckeri, which proves so destructive to Grapes, consists of a network (spawn, *thallus*, *mycelium*) of white and very fine filaments, which cover the green and healthy parts of the Vine, and occasion the formation of brown or black blotches. From these filaments, which are all on the surface of the epidermis of the vegetable nourishing them, arises a forest of small, simple, erect, cellular stems, of which the last articulation quickly becomes a large oval cell, capable of propagating the Oïdium like a seed.

Independent of these reproductive bodies, the Oïdium Tuckeri possesses brown fruits, usually pedicellate, the coatings of which are membranes composed of cells, and containing an immense number of very small seeds, which likewise readily germinate. These fruits are usually larger than the terminal seeds just spoken of; but their size often does n exceed that of the latter; resembling them in form, they are frequently borne on the same footstalk, so that one might imagine they resulted from the transformation of the primitive seeds. M. Cesati was the first that I know of who recognised the existence of these fruits, but he did not suspect that they belonged to the Oïdium, and he took them for the reproductive organs of a distinct sort of mildew, which he called Ampelomyces quisqualis. M. Amici has since attributed them to the Oïdium Tuckeri, of which he thinks they are the most perfect organs of generation. I have myself seen the organs in question on diseased Vines in the neighbourhood of Paris. I have not only seen them as other observers have, sometimes elongated, sometimes globular, but I also perceived that among the globular there were some large ones which were perfectly spherical and sessile on the byssus which produces them. These observations have led me to conceive quite another idea of the Oïdium Tuckeri than that admitted by those authors, who up to the present time have been considered as authorities on the subject.

There is a sort of mildew common in our country which, in its first stage, is not in any way different from the fungus nourished by the diseased Vine. The Erysiphes, as they are now called, present, for the most part, ovoid terminal seeds, and also brown many-seeded conceptacles similar to those above mentioned. By means of numerous observations, made principally on the E. pannosa, Knautiæ, guttata, aduncа, holosericea, Berberidis, Prunastri, lamprocarpa, and Martii, I ascertained that the fruits in question assume various forms in the same species of Erysiphe; that they are cylindrical, elongated, simple or two-celled, naked, or surmounted with beaded cells, which are ovoid, roundish, or even perfectly spherical; that among the latter some are without any filiform appendages, whilst others are furnished with the same distinctive hairs as the thecigerous fruits, and resemble them so much as not to be distinguishable by their external characters only.

Many mycologists still doubt whether the ovoid seeds which cover with a white dust the thread-like thallus, on which, at a later period, the ascophorous conceptacles of the Erysiphe appear, do really belong to these fungi. They believe that these seeds, and the white byssus which produces them, constitute together a distinct and complete plant, a fertile Oïdium, of which the Erysiphe is only a parasite, or a subsequent companion. They maintain that fungi have only one set of reproductive organs; but this opinion is every day losing credit.

Several very strong reasons are now opposed to Erysiphes being considered as parasites, or the usual companions of various kinds of Oïdium.

In the first place, the association of existence observed in the case of Erysiphe and the so-called Oïdium—for instance, between E. pannosa and O. leucoconium, and between E. graminis and O. monilioïdes, &c.—is so constant that it would imply a necessary relation between these minute plants; so that if the Oïdium is a different plant from Erysiphe, the latter must certainly be a parasite on the former. Besides, one cannot distinguish in the mycelium which bears at the same time the necklace beads of the Oïdium, and the fruits of the Erysiphe, filaments peculiar to either; for, by careful examination, it will be perceived that the conceptacles of the Erysiphe actually proceed from the same threads which elsewhere give rise to the generating pedicels of the naked spores.

In the second place, in order to be certain that there is no real parasitism in the case, and that there are not two distinct plants associated together, but only one endowed with several organs of generation, it is sufficient to consider the many-seeded fruits before spoken of, which vary so much in their form that they present every possible intermediate stage between the spores of the so-called Oïdium and the ascophorous conceptacles of Erysiphe, the most perfect reproductive organs which nature has given to these fungi.

These many-seeded fruits being thus present in the Oïdium in the shape of the separate articulations of the necklaces of spores, and on fertile Erysiphe as conceptacles exteriorly identical with their perithecia, evidently unite Oïdium to Erysiphe, and furnish the best proof that they are one and the same genus. In other words, the organs in question do not, as M. Amici would induce us to believe, solely constitute the reproductive apparatus of Oïdium, supposed to be a peculiar genus, but they really belong to Erysiphe as much as the naked spores of Oïdium, and represent a mode of propagation intermediate between that by spores and that by thecigerous conceptacles.

From this fact it may be concluded that Erysiphes, like many other fungi, possess at least three distinct modes of propagation, and three special sets of organs for that purpose. In the order of their successive development, the first and most simple is that which consists in naked spores, disposed in necklace-like rows, which I call CONIDIA; then come conceptacles of various forms, full of innumerable and very fine seeds, and to which I have given the name of PYCNIDIA; and finally, the more perfect, globular, black SPORANGIA are produced, in which one or more few-seeded thecæ are engendered.

This being admitted, it is evident that the Oïdium Tuckeri, with its naked terminal spores and its many-seeded fruits, represents an Erysiphe reduced to its two secondary modes of propagation; so that the most important blank remaining to be filled up in the history of this enemy of the Vine consists in determining to what species of Erysiphe it belongs. Now, until its ascophorous fruits shall have been observed, the determination of its species cannot be made in a satisfactory manner, for its two other organs of reproduction are insufficient to distinguish it from a great many other congenerous plants, possessing identical organs.*

If the fungus on the Vine is an Erysiphe, we need not be surprised at the damage which it does. Erysiphes are all true parasites;† and they always cause diseases more or less serious in the plants which nourish them.

No one is ignorant of the injurious effects produced by Erysiphe Humuli on the Hop, or how prejudicial E. bicornis is to the Maple, as well as E. clandestina to the common Hawthorn, and E. Pisi to late Peas, &c.

The disease, usually called the mildew, so formidable to the Peach tree, is apparently caused by nothing else than Erysiphe pannosa, a species which is also prejudicial to the Rose tree; this mildew is likewise rich in conidia, pycnidia, and sporangia. There has never been any hesitation, so far as I know, in attributing to these various Erysiphes the atrophy, the organic malformation, and the sterility with which their victims have been afflicted; wherefore then should the Erysiphe which attacks the Vine be less capable of inflicting injury than its fellows, and why should we seek to explain otherwise than by its action the disorganization of the Vines thus attacked? If the Vine were supposed to be diseased before the appearance of the parasite, the same supposition, notwithstanding its improbability, must be made not only in the case of all the other plants, wild or cultivated, which nourish Erysiphes, but also as regards those at whose expense Uredo, Ustilago, Rhytisma, and a host of other parasites live.

It may undoubtedly be admitted that these do not attack indiscriminately all the individuals of the species on which they live, and that the physiological condition of the individuals, varying with age, situation, seasons, and other circumstances, exercises some influence in the development of fungi; but this general proposition, which would in several respects be justified by the mode of life proper to many of these fungi, appears no longer to hold good when their enormous increase assumes the character of an universal plague, which constitutes a phenomenon as far beyond our explanation as it is above our comprehension. *M. Tulasne, in Comptes Rendus, Oct. 17th*, 1853.

The following facts were at the same time mentioned by M. Payen in support of the foregoing observations of M. Tulasne:—

Mr. F. Mallot, of Montreuil, employed, in 1851, the flowers of sulphur with success against the mildew on the Peach tree. Several arboriculturists, and especially M. Orbelin, have had recourse to the same means, and these have always proved efficacious. M. Verdier likewise succeeded in freeing Rose trees from the species of mildew which attacks them, by dusting them with flowers of sulphur. Thus the remedy which has been most successfully employed to combat the Grape mildew is the same as the one which appears to be the most efficacious in curing similar diseases in Peach and Rose trees. These facts appear to agree perfectly with the opinion of M. Tulasne, who attributes the diseases in Vines, Peach trees, and Roses to Erysiphe.

Home Correspondence.

The Woods and Forests.—My attention having been drawn to two articles in the *Gardeners' Chronicle*, dated respectively the 6th and 13th inst., on the subject of Alice Holt Forest, I beg to forward you the following statement of the facts, as far as I am concerned. On the 12th of March, 1853, I gave in a report on that forest, in which, among other particulars, were stated certain averages of sizes of trees and their number per acre in the various enclosures of it. These averages were struck by the method usually employed in the profession; they were struck with all fairness on my part, and I am prepared to maintain their substantial accuracy, and that they would be found substantially correct by any unprejudiced and uninterested referees. In a counter report by the deputy-surveyor of the forest, my results were in almost every case denied; diameters were asserted much larger, and numbers of trees much less than those which I had stated. In conformity with instructions given me, I again proceeded to the forest to revise my statements, accompanied by a gentleman from the office of Woods and Forests to assist and check me in my calculations. The results were such as, with no more of variation than inevitably occurs in every such case, completely bore out my former estimates, and set aside those of the deputy-surveyor. Three gentlemen are now sent down by the Treasury; of two of these I know nothing; the third is one of the present deputy surveyors in the Royal forests, and therefore hardly to be regarded as altogether an uninterested witness. The report of these gentlemen completely bears out Mr. Higinbotham's statements—indeed, with a degree of closeness and precision itself suspicious. The differences between us are not such trifling ones as could have accidentally arisen; they run, as regards the number of trees, from 60 to 100 per cent.; and as

* To whatever species of Erysiphe the one which lives on the Vine be referred, its barrenness in ascophorous fruits cannot be a special character; for several are known, such as E. Martii, E. communis, E. lamprocarpa, &c., which are frequently the same in this respect, either owing to the plants which bear them, or the situations where these plants are growing, or to other circumstances which have escaped our observation.

† It will be readily understood that, among several species, the filaments of the mycelium are provided with small rounded appendages, which are probably organs of suction. We have more especially observed them in Erysiphe Martii, and in E. communis. M. Gasparini, and afterwards M. Mohl, have seen several such in the Vine mildew, where, in fact, they can be readily found.

regards their diameter, from 15 to 50 per cent. I am prepared to stand by the substantial accuracy of my results, and to prove it on the spot to any disinterested referees who may be appointed; but in the mean time I am condemned, and Mr. Kennedy is in some degree included in my condemnation. There are one or two other points in the report of the referees, which, though of minor importance, seem to betray the general animus actuating them. For instance, it is objected to me that I give the entire age of one division of an enclosure at 40 years, while they, apparently by cutting down trees here and there, find that only a portion of it is of that age, and the remainder from 35 to 38. I can only say in answer to this that I founded my statement, as I conceive I was quite entitled to do, on the account given me by the deputy-surveyor and his foreman, and that this can hardly be fairly attributed to me as a fault. The only other point to which I need refer is the question of drainage. This I assert to be on the whole inefficient and comparatively worthless; the referees are of a different opinion, though some of their admissions bear out that, in parts at least, it is as I have called it. This, however, is very greatly a matter of opinion. What would have been considered efficient drainage 30 years ago, would hardly now be regarded as such. What may be regarded as sufficient in Alice Holt Forest might in more advanced localities be looked on as an exploded barbarism. *James Brown, Edinburgh, May* 16.

Page's Prodigy Pea.—Seeds of this very dwarf and early variety were obtained from Messrs. Page and Co., of Oxford Street, Southampton, whose name it bears, and were sown side by side with many others in the first week of December last. It has proved equally early as the Frame and Danecroft Rival, and much more so than the Long-pod Dwarf, to which it bears some resemblance; but it differs from that variety in the leaves being somewhat smaller, and the plant of a more dwarf habit. I send raw specimens of both sorts, to show their difference, and the precocity and prolific habit of the Prodigy Pea. I have found it an admirable variety for cultivating on the beds of the large fruit house at this place, and I consider it well adapted either for pot or frame culture, or for growing at the bottom of fruit-tree walls, where a protection could readily be afforded it from the inclemency of the weather. *James Duncan, Basing Park, May* 14. [The Prodigy was covered with small pods, containing on an average four Peas each, while the pods on the Long-pod had scarcely formed, and of course contained no Peas fit for use.]

Sikkim.—The Rhododendrons of this district have been represented, previous to this last winter, as all hardy, save only Dalhousiæ and argenteum. Can any of your correspondents favour us with a state of the case now, after the recent severe experience? It would be very acceptable. *A. H.*

McAdam's Anti-Grape Blight Composition.—The Grape blight pestilence, which appeared again in the Channel Islands about a month since, has again visited us in the West of England in a most virulent form, and from past experience there can be little doubt of its again rapidly spreading through the length and breadth of the land. It is for this reason (and I speak very feelingly upon the subject, from having lost large quantities of fruit myself from the Vine disease) that I would earnestly draw the attention of the Grape growing community to the advertisement of an "Anti-Grape Blight" composition in your last number of the *Chronicle* by a Mr. M'Adam, which, from experience during the last season and the present, I have found to be as effectual as a preventive as it is in destroying the disease after it has made its appearance; and that without the slightest injury to the Vines, which, on the contrary, appear to grow more vigorously after the application of this remedy. One most decided advantage of this over all others that I have heard of is that it is applied in a liquid state (prepared from a powder by simple ebullition) by a common garden engine or syringe, by which not only a vast deal of time and trouble are saved (about 10 minutes being sufficient to go over a large Vinery), but the annoyance and inconvenience of having the Vines covered with sulphur powder (a common application) throughout the summer, and from which a continued and disagreeable odour so given out, is avoided; but I will proceed now in a few words to state the results of the application of this, as I have found it, valuable composition. I should mention in the first place that I have two rather large Vineries close to each other, in which I have been a successful grower until visited by the Vine disease, by which, the year before last, my crops were entirely destroyed, notwithstanding the trial of several proposed nostrums. Last season, by the advice of a gardening friend, I determined to try M'Adam, and the result fully justified his recommendation. I proceeded, of course, according to the given directions, by syringing the Vines (in one of my houses) thoroughly with the diluted liquid, as soon as the foliage was fully expanded, about a fortnight before the Vines were in bloom, and again after the berries had attained the size of a small Pea, and after this, nothing could exceed the health of the Vines and fruit, which arrived at full maturity, without any trace of disease being observed in this house during the season, which, from what followed, fully proved, I think, the preventive properties of this composition. Now, I beg you to remark what happened in my remaining Vinery, which was, of course, exposed to precisely the same influences. This house I purposely omitted (by way of experiment) to syringe with M'Adam's liquid in the earlier part of the season, and the consequence was that the berries, when about half the full size, were attacked with the blight, as in the preceding season, but, fortunately, I found the application of the liquid destroy it completely, and it did not appear again; but the property of this liquid in destroying the Grape blight I have again had an opportunity of proving this season; for, upon arriving at home, after being some time absent, on the 1st inst., I found (by the neglect of my man, I am satisfied, in not syringing my Vines) both my houses inundated with blight—to such a degree, indeed, that I almost feared they had got past recovery; not so, however, as it turned out, for vigorous syringing, as before, has quite destroyed it, as you will perceive by the small bunch of Grapes I beg to send for your inspection, on which even the bloom is uninjured, although the blight has left its mark upon the fruit, where it for a time vegetated. I also enclose a small phial of the saturated liquid prepared from M'Adams' composition (a quart of which is directed to be mixed with 12 gallons of water). There is clearly sulphur largely present in chemical solution, but it would be hardly fair to the inventor to analyse it too closely, as it can be obtained at a moderate cost. *Devoniensis, Exeter.* [The effect of the wash in question had undoubtedly been remarkable on the specimen sent; but the mildew was still discoverable among the berries.]

Effects of the Frost on the Nights of the 24th, 25th, and 26th ult.—My register thermometer being deranged, I was not able to ascertain the minimum temperature of these nights; but a common thermometer, hanging on a pole 5 feet from the ground, indicated 8° of frost at 6 o'clock in the morning of the 25th; 6° at the same time on the 26th; and 10° on the morning of the 27th. Water in tanks and pools had ice upon it as thick as a penny. The blossoms on all the standard Pears, Plums, and Cherries, which were as fine as I ever saw them, are all killed; and the Apple blossom that was expanded, and what was not, I find has been much injured. Gooseberries, which were larger than large Peas, suffered materially, and the main crop is now falling. Black and Red Currants and Raspberries appear to have escaped; Peaches, Nectarines, Pears, and Cherries against south-east and west walls, where the young fruits were in contact with the wall, are saved, while the fruit upon spurs projecting from the walls has been killed, as well as the points of the shoots of Peaches and Nectarines. The leaves of Figs against a south wall are all turned black, &c. The fruit, which was as large as Filberts, has shared the fate of that of other wall trees. Strawberry blossoms, although not then expanded, have, I fear, been all killed. All the spring-sown Broccoli, Cauliflower, Cabbage, Brussels Sprouts upon south borders, both first and second sowings, have been killed; young Turnips have been all swept off, and so has every head of Asparagus that was above ground. Linnæus and Prince Albert Rhubarb suffered considerably, while Victoria upon the same quarter was uninjured. Young shoots of Box edging look as if they had been scalded. Peas of different sowings, even those in bloom, do not exhibit signs of injury. Abies cephalonica, Webbiana, and Deodara, 3 feet high, in a low situation, surrounded with a belt of forest trees of 50 years' growth, had all their young shoots killed, although they were protected with mats; Abies Pinsapo and Menziesia in the same situation escaped. The same kinds, with Abies Morinda, Smithiana, Pinus excelsa, and maritima, upon high grounds in the park, were uninjured, although they had pushed considerably. Oaks, Sycamore, and Beech, in several parts of the park, particularly upon low situations, have had all their young shoots killed to the height of 12 and 16 feet, above which line they are uninjured, except one Sycamore tree, a very early variety, standing at the head of a piece of water sheltered all round, except from the north-east, through a narrow channel over the pond; this tree, a large one, 30 feet high, has all its leaves blackened and its shoots killed. In many parts of the park, especially in low places, the Grass has been killed over large patches of from 20 to 50 feet square. Such a destructive frost at this season has never been remembered by the oldest inhabitant. *Henry Bundy, Dynevor Castle, Llandilo, South Wales.* —— On the night of the 24th ult., the self-registering thermometer at Worcester, on the Grass (100 feet above the level of the sea), sunk to 22°. There was ice on the pools more than one-eighth of an inch thick. Its effect on vegetation has been very disastrous—Pears, Cherries, and Plums, are all cut off; Black Currants and Gooseberries injured; but my Red Currants have escaped. I do not yet know its effect on the Apples. The Gooseberry caterpillar is devastating all the gardens of this neighbourhood; and, being the second year, its effects are likely to be most serious, if not promptly stopped. I have tried nearly all the receipts given in your back numbers, but find none of them effective, except the white hellebore. Since dusting the trees with that, I have been almost free; it not only kills the caterpillar, but, I think, prevents the fly from settling on the leaves to lay its eggs. My bushes are about two years old, and the cost for labour and powder is about 2*s.* 6*d.* or 3*s.* per 1000. *R. Varden, Seaford Grange, near Pershore.*——Mr. M'Pherson states (see p. 285) that at Castle Semple, they had only 2° of frost on the 24th ult. How can that be accounted for when there was so much more over the country in general? Where I live is about 10 miles from Castle Semple, and we had 10° at half-past 4 o'clock that morning, and still an average crop of fruit is left on the wall trees, although they were not protected, and since that time I have visited gardens in the county of Renfrew and in the adjoining one of Ayr, and found not only the fruit but also the foliage, and, in one case, the young wood of Apricots, killed partly back, and that with 12° of frost. I have no doubt that many of your readers, as well as myself, are at a loss to understand what Mr. M'Pherson means by saying that his Apricots and Peaches on the open wall are about the size of Pears; will he be so good as explain? *B., Renfrew.* [The word Pears, we learn from Mr. M'Pherson, was a misprint for Beans.]

Deutzia scabra.—By the aid of a pocket lens, numerous beautiful starry bodies may be seen on both the upper and under side of the leaves of this Deutzia. They are not hairs, I think, but have more the appearance of crystals, perhaps of silica. I cannot find them on the leaves of any other plant with which I am acquainted, and have searched in Dr. Lindley's "Introduction to Botany," but without being able to satisfy myself as to their exact nature; nothing under the head of Raphides or that of Biforines appearing to include these very beautiful objects. Will you, therefore, kindly communicate what is known of these interesting little stars. *G. M.* [These are generally understood to be stellate hairs, hardened by some siliceous (?) secretion.]

Storing Apples.—A London merchant, whose fruit, when freshly gathered from the tree, could scarcely have a more crisp and juicy appearance than some which he had preserved for the best part of a year, gives his system of storing as follows:—"I provide a number of wide-mouthed earthenware jars, no matter of what size, so that they will contain each not less than a gallon, which size, however, I consider most convenient. If I have the least apprehension of their being damp, I have them put, for two or three days, in a warm place in my kitchen, or, for one or two days consecutively, in a slow oven, which, perhaps, is the better mode. Conjointly with this jar-drying process, I procure a bushel or so of sharp clean white sand, which I thoroughly bake. Thus much for the preliminaries; now to business. When the Apples which I wish to preserve are perfectly ripe, not dead ripe, but sufficiently so to be full flavoured, I carefully go over the trees myself on a fine sunny day, which I devote wholly to this little hobby of mine, selecting only the handsomest and best fruits. These I very carefully separate from the tree by slightly raising each in a direction contrary to that in which it has grown; for, if they are ripe, they will readily separate without damaging the stem; if they do not, I leave them for another opportunity. As I pick them one by one, they are cautiously deposited in a wide shallow basket, which my man carries for me, in the bottom of which is a layer of thick wadding, to prevent the possibility of bruising, a contingency which every precaution must be taken to prevent. Well, I have enough for one jar, and the process of filling that will illustrate my system as well as a hundred. I first strew a layer of the dried sand over the bottom of the jar, about half-an-inch thick. Upon this I place as many Apples, with their stems uppermost, as the space will contain without the Apples touching each other (they should be half-an-inch apart), or the sides of the jar. I hold perfect isolation, with respect to each other, as an essential item in my system. Upon this first layer of fruit I strew sand sufficient to fill in the spaces between them, and to form a layer half-an-inch thick above them. Then another layer of Apples then sand again; and so on, to within 3 inches of the top: that space I fill with sand. To insure the thorough filling in between and around the Apples, as each layer is placed gently tap the sides of the jar; this will also consolidate the whole, as it were, into one mass. When the filling is completed, place the jar in a cool dry room, where the temperature is tolerably uniform, and where they will not be disturbed until wanted. An ordinary store-room, if a proper one, will do very well. It will be observed that I lay great stress upon careful handling, to prevent bruising, upon the fruit being perfectly ripe, and upon perfect isolation with respect to each other when in the jars. That the fruit should be without the slightest bruise I hold to be highly essential to the success of my plan as regards preservation, and that they should be fully ripe, to insure the natural flavour of the variety. As regards the separation of each from the other, that, too, is also important, for should one by chance become rotten, which, however, rarely happens, the contagion is confined to where it originated. Their being, as it were, hermetically sealed and uninfluenced by variations of temperature, the fluids of the fruit have little to contend with from external agency. *Crayon.*

Cereus.—A friend of mine in Gloucestershire informs me of a successful experiment on the night-flowering Cereus, which, by cutting off the pistil (stigma?), is kept in flower to the next day. I am not aware whether the case is known, or whether there is any general principle known, to which it can be referred. The words "to the next day" are perhaps not quite unambiguous, therefore I send them to you as I received the statement. *A. H.*

Foreign Correspondence.

MEMORANDA FROM THE ANTIPODES.—*On the Effects of Low Temperature upon Plants of Delicate Habit in respect of cold under certain conditions.*—A winter of unusual severity succeeded an autumn which had been dry and unfavourable to vegetation. The frosts commenced with the month of May, nearly a month sooner than usual, and continued until late in September, broken only by four several periods of deluging heavy rain. During the latter, great floods were experienced in the rivers, and vast tracts of the interior laid under water; whilst, on some of the more elevated and exposed

sheep runs, the snow was lying several feet thick, the flocks having been nearly starved before it melted. I was not at home during the more intense frosts, and I regret that means were not taken to ascertain, by observation, the minimum open air temperature, where no impediment to free radiation existed. A correct thermometer, under the shelter of the roof of an out-building, open in front, but much sheltered and enclosed by walls and other out-buildings, on several mornings showed 18° Fahr. The site is well sheltered by trees upon a moderately sloping hill 100 to 120 feet above the neighbouring plain and valleys, 20 miles distant from the open sea, and 236 feet above its level. Excepting under a calm, bright, transparent sky, the night temperature rarely or never descends below 50 or 55° ; and when this condition does occur, it is customary to find several degrees difference produced in the night temperature by the slightest description of shelter. Careful observations during several winters with good instruments indicated a difference on calm clear nights of from 5° to 10° and 12°, between the neighbouring low grounds and the site 120 feet higher, where a sheltered thermometer indicated 18°, the cold in the valleys being always greatest. After thus stating the result of numerous former observations, my estimate of the external minimum temperature will not appear too low at 15° for the higher level, and 10° for the lower. I believe these estimates to fall short of the fact. Now, very sharp white frosts are almost always succeeded by bright warm sunshine ; it appears from actual observation that the mid-day temperature in the shade reached 63°, and 64° during the intervals between the coldest nights. As we cultivate many plants, the larger specimens wholly unprotected, which are subjected to stove and greenhouse treatment in England, it may be instructive to practical men to be told how some well-known species have borne so severe a trial in a climate where their season's growth becomes perfectly matured before winter. I subjoin the names of a portion, therefore, with the condition in which they were found on the return of warm weather. It is remarkable that some intra-tropical specimens from Brazil, and sub-tropical plants from the coast about Moreton Bay, appear to endure cold better than some which are found growing wild within a mile or two of the site, but in well sheltered situations.

Plants growing in the Higher Temperature, where the extreme Range during 24 hours appears to have been from 15° (fully exposed) to 64° in the shade.

All fully exposed to the alternations of temperature, and killed to the ground; healthy below.

Stephanotis floribundus
Combretum purpureum
Bignonia cherere
Cantua pyrifolia
Luculia gratissima (since dead)
Bougainvillea spectabilis
Bouvardia triphylla, and two others
Strelitzia augusta
Hedychium coronarium
Pelargoniums
Hibiscus heterophyllus
Ficus australis — Indigenous to the neighbourhood, some of them to the very spot.
Tecoma sp.
Kennedyas
Indigoferas

Bougainvillea spectabilis, very large specimen, stem 25 inches round, trained against a high wall exposed to morning sun—leaves and young shoots killed, flowering for the season prevented, old wood uninjured.
Ditto, smaller plant, against wall, northern (mid-day sun) exposure—not so much nipped.
Petrea volubilis, same situation—slightly injured.
Bignonia venusta, close adjoining, but without the reach of radiation from the wall—a little more nipped.
Bauhinia scandens, fine large specimen, stem 8 inches in circumference, southern exposure, no sun—uninjured.
Passiflora racemosa, against wall, eastern exposure—a little nipped.
„ kermesina, „ western exposure—much nipped.
Ficus macrophylla, large specimen, about 35 feet high, congeries of roots and stem at 2 feet from the ground, 10 feet in circumference—shoots killed for 4 or 5 feet back, leaves quite destroyed.
Stadmannia sp. — Indigenous within 15 miles—plants of 15 feet high killed nearly to the ground.
Brachychiton acerifolium
Oranges
Lemons — In full bearing—much nipped on the sides exposed to the sun, fruit of Oranges acid and inferior.
Limes
Shaddocks
Citrons—killed nearly to the ground.
Araucaria Cooki, 3 feet high—a little nipped.
Dammara nov. sp., from Wide Bay — A little affected only.
„ „ New Caledonia
Araucaria Braziliensis, 18 feet 6 in. high—uninjured.
„ Bidwilli, 12 feet 6 in. high—uninjured. A most beautiful species, far excelling any of the others.
„ Cunninghami, 28 feet high—uninjured.
„ excelsa, 12 „ „
Lagunaria Patersoni 25 „ „

Plants cultivated at the Lower Level, where the Night Temperature is estimated to have been as low as 10°, and the Day Temperature up to 64° in the shade.

Camellias, a great variety of all sizes, the blossoms about to expand, were injured; but as soon as the severe frosts passed, they recommenced flowering without appearing to have suffered.
Azalea indica—many varieties wholly uninjured.
Olives, from 15 to 25 feet high—wholly uninjured.
Magnolia grandiflora, „
Brugmansia arborea — Killed to the ground.
Erythrina Crista-galli

A Deodar planted in 1841, about 18 inches high, is now 27 feet 6 in. high, with the stem beneath the lower tier of branches 3 feet from the ground, 12 inches in diameter. The leader was broken four years back by a large bird. The tree has formed a fresh leader this season, but has lost 3 or 4 feet growth at least.
A layer from the above, planted out six years, is just 17 feet high.
Cupressus torulosa, planted at same time, 4 feet high, is 21 feet 6 inches, and a magnificent pyramid.
Pinus canariensis, planted same time, 3 feet high, is 23 feet.
„ macrophylla, „ „ 20 feet 6 in.
Cedrus Libani, a layer, nine years planted, is 16 feet 6 in.
There are only a few instances of remarkable growth in a large collection of Conifers growing here.

—*W. McArthur, Camden, N. S. Wales.*

Societies.

Horticultural: Garden Exhibition, *May* 13.—As the leading features of this excellent display of fruits and flowers are given in another column, we will at once proceed here to particularise the various matters exhibited.

In collections of 20 Stove and Greenhouse Plants, the First Large Gold Medal was awarded to Mr. Green, gr. to Sir E. Antrobus, Bart., of Cheam, for the following, viz. :—

Aphelexis macrantha purpurea rosea
Azalea Iveryana
„ variegata
Daviesia latifolia
Dillwynia ericifolia
Erica depressa
„ propendens
Eriostemon intermedium
Franciscea acuminata
Franciscea confertiflora
Gardenia Fortuni
Gompholobium grandiflorum
„ barbigerum
Ixora crocata
Leschenaultia formosa
Pimelea Hendersoni
„ spectabilis
Polygala acuminata
„ cordifolia

Azalea variegata, in the shape of a huge bush, profusely covered with blossoms in the best possible condition, was certainly the most striking plant of this group; but a smaller plant of A. Iveryana was also very fine, being one mass of white flowers, which were all the more admired because they were occasionally striped with pink. The greatest favourite of the whole, however, was evidently Gardenia Fortuni, which was one of the best plants of the kind we have seen ; the numerous large wax-like flowers with which it was thickly ornamented being beautifully fresh, and delightfully fragrant. Pimelea spectabilis, though not to be compared, as regards size, with the large specimens of this plant which were wont to be furnished from Ealing Park, was nevertheless an admirable specimen, and, being covered with flowers, it was very effective. The purple-blossomed Polygala acuminata was also in fine condition ; and there were beautiful bushes of Leschenaultia formosa, and that best of Everlastings called Aphelexis macrantha purpurea. The worst plants in the group were Erica propendens and Gompholobium barbigerum, the former of which was badly coloured, and the latter was scarcely in bloom, and evidently enjoying but indifferent health. With these two exceptions, however, the exhibition was an extremely good one.

Mr. Gilham, gr. to R. Scott, Esq., of Leyton, Essex, was second. His plants were—

Allamanda cathartica
„ neriifolia
Aphelexis macrantha purpurea
Azalea, Double Red
„ Duke of Devonshire
Chorozema varium nanum
Clerodendron Kœmpferi
Epacris paludosa
Erica Cavendishi
„ vestita alba
Eriostemon buxifolium
„ neriifolium
Ixora coccinea
Leschenaultia Baxteri
Pimelea decussata
„ Hendersoni
Polygala Dalmaisiana
Statice Holfordi
Vinca oculata
„ rosea

The double flowered red Azalea in this collection was a noble plant, and being well flowered was one of the most effective of the group. The Oleander-leaved Allamanda, though not so large in the flower as A. cathartica, is nevertheless a species of very considerable beauty, and being compact in growth it is extremely well suited for those who have but limited accommodation. The Kœmpfer Clerodendron was well grown, and its noble panicle of brilliant scarlet flowers, well elevated above the broad massive foliage in which this plant is clothed, had a capital effect. The Holford Statice, a sort very much in the way of macrophylla, was also much admired, being one of the very best of the larger growing kinds. The Cavendish Heath was very skilfully grown and flowered, and the same may be said of the Ixora, whose large scarlet heads were both numerous and well coloured.

In collections of 15 Stove and Greenhouse Plants, the first prize was awarded to Mr. Hamp, gr. to J. Thorne, Esq., of Mawbey-house, South Lambeth. This group consisted of—

Aphelexis humilis
Azalea, Duke of Devonshire
„ triumphans
Boronia spathulata
Cyrtoceras reflexum
Dracophyllum gracile
Epacris grandiflora
Erica Cavendishi
„ ventricosa densa
Eriostemon myoporoides
„ scabrum
Pimelea decussata angusta
„ Hendersoni
Polygala oppositifolia

Of these the Azalea triumphans was finely in flower, as was also the variety called the Duke of Devonshire, which is striking in colour. Of the Eriostemons, scabrum is best suited for small collections; but where there is room, myoporoides, when well bloomed, as this was, is greatly the most showy. Boronia spathulata, though a profuse flowering species, is too dull in appearance ever to make a good exhibition plant. The Hoya-like Cyrtoceras reflexum was small and scarcely so well bloomed as it should have been. Its healthy fresh green foliage, however, helped very much to compensate for the defect.

Mr. Rhodes, gr. to R. Philpots, Esq., of Stamford Hill, produced—

Aphelexis humilis
„ macrantha purpurea
Boronia spathulata
„ tetrandra
Chorozema Lawrenceanum
Cyrtoceras reflexum
Epacris grandiflora
„ miniata
Erica Alberti
„ Brunioides
Eriostemon neriifolium
Leschenaultia Baxteri
Oxylobium pultenæa
Pimelea linifolia
Tetratheca verticillata

Among these the Lawrence Chorozeme was in all respects a first-class specimen, being finely in flower, and staked just sufficiently to support the shoots gracefully, without making the plant stiff or formal. The Oxylobe was especially conspicuous for its numerous large heads of rich yellow flowers ; but the plant which was deservedly most admired was an example of Tetratheca verticillata, which was so thickly set with deep purple or rather violet blossoms as to nearly hide the pretty Heath-like foliage with which they were intermixed.

Collections of 6 Stove and Greenhouse Plants, in 20-inch pots, were contributed by Mr. Dods, gr. to Sir J. Cathcart, Bart.; Mr. Carson, gr. to W. F. G. Farmer, Esq.; Mr. Peed, gr. to J. Treadwell, Esq. ; and Mr. Morris, gr. to C. Child, Esq., of Bromley.—Mr. Dods had large and fine specimens of Erica Cavendishi, Eriostemon neriifolium, Azalea lateritia, Polygala acuminata, Boronia pinnata, and Chorozema ilicifolium.—Mr. Carson sent Ixora coccinea, Gardenia Fortuni, Epacris grandiflora, Double red Azalea, Polygala oppositifolia, and Chorozema Lawrenceanum. Both of these groups contained plants which for size and beauty were not surpassed by any in the whole exhibition. From Mr. Peed came Azalea optima, Erica ventricosa, Adenandra speciosa, Clerodendron Kœmpferi, Pimelea spectabilis, and Chorozema Henchmanni. Mr. Morris produced Stephanotis floribunda, Pimelea decussata, Hoya imperialis, Allamanda neriifolia, White Indian Azalea, and the Siebold Medinilla. Though large and fine, these plants were scarcely sufficiently advanced in bloom.—Groups of 6 in 13-inch pots came from Messrs. Taylor, Over, Dods, Jarvis, and Pamplin. Among these we remarked Everlastings, Boronias, Azaleas, Leschenaultias, Polygalas, Heaths, Epacrises, Coleonemas, Hoyas, Oxylobes, Eriostemons, Cyrtoceras reflexum, and good plants of Chorozema.

A collection of Everlastings was exhibited by Mr. Taylor, gr. to J. Coster, Esq., of Streatham. It consisted of Aphelexis speciosa, sesamoides rosea, s. superba humilis, macrantha purpurea, and macrantha rosea.

Orchids. — These, as might have been expected from the liberal rewards offered for them, were numerous, and being unusually fresh and beautiful, which they always are in May, we need not say that they were universally admired. In collections of 20 plants, Mr. Williams, gr. to C. B. Warner, Esq., of Hoddesdon, received the highest award for :—

Aerides crispum
„ virens
Burlingtonia fragrans
Calanthe veratrifolia
Cattleya intermedia
„ Mossiæ
„ Skinneri
Chysis bractescens
Cypripedium barbatum
„ Lowei
Dendrobium macrophyllum
„ nobile
Epidendrum auranticacum
Oncidium ampliatum majus
Phalænopsis amabilis
„ grandiflora
Phaius Wallichi
Saccolabium retusum
Trichopilia coccinea
Vanda tricolor

Of these the most conspicuous was certainly the white blossomed Calanthe, which was a noble plant with some 18 flower spikes well elevated above its ample Veratrum-like foliage. The Moss Cattleya was one of the best forms of that plant, and the handsome purple blossoms of Cattleya Skinneri were unusually brilliant and attractive. Dendrobium nobile was a fine example of that useful species in its best state, being quite 3 feet high and as much through, and covered with flowers. The Cypripedium Lowei furnished two of its singular blossoms, and the Trichopilia coccinea was beautifully flowered, and a well grown example of that comparatively new species. In short, the collection altogether was extremely good, and well deserved the high position the judges assigned to it.

Mr. Blake, gr. to J. H. Schröder, Esq., to whom the second prize was awarded, produced—

Cattleya intermedia
„ Skinneri
Calanthe veratrifolia
Cypripedium barbatum
Dendrobium densiflorum
„ densiflorum album
„ Pierardi
Epidendrum bicornutum
Lælia cinnabarina
Oncidium Papilio
Oncidium phymatochilum
Phaius Wallichi
Phalænopsis amabilis
„ grandiflora
Saccolabium retusum
Schomburgkia tibicinis
Trichopilia tortilis
Vanda cristata
„ teres
„ tricolor

The Wallich Phaius was a fine plant, but considerably the best feature of the group was Lælia cinnabarina, whose 6 spikes of brilliant orange scarlet flowers well merited the attention they received. The Twisted Trichopil was as compact and finely-flowered as we have ever seen it in former years, and the Skinner Cattleya was covered with blossoms, large in size and beautifully coloured. Dendrobium Pierardi was not elevated sufficiently to let its spikes hang down, and consequently the effect they would otherwise have produced was thus greatly impaired. Dendrobium densiflorum was a fine specimen of that showy yellow kind. The variety called D. d. album resembled very much a highly coloured example of D. Farmeri.

From Mr. Woolley, gr. to H. B. Ker, Esq., came—

Brassia verrucosa
Cattleya intermedia
„ Mossiæ
„ Skinneri
Cypripedium barbatum
Cyrtochilum maculatum
Dendrobium Farmeri
„ nobile
„ Paxtoni
Epidendrum crassifolium
Odontoglossum citrosmum
Oncidium ampliatum majus
„ phymatochilum
„ sphacelatum
Phalænopsis grandiflora
Phaius Wallichi
Vanda tricolor
Warrea tricolor
Zygopetalum crinitum
„ rostratum

The large variety of Oncidium ampliatum in this group was strikingly beautiful, its clear yellow flowers being just in perfection, and no more. The Farmer Dendrobe was scarcely sufficiently advanced in bloom, which was to be regretted, for it was one of the best specimens we have seen of this fine and somewhat scarce kind. Cattleya intermedia, with its bright purple tipped lip, was a charming plant, as was also the Paxton Dendrobe, which is one of the handsomest of the dark spotted yellow sorts. The Warrea was an object of interest on account of its rarity. The Odontoglossum was good ; but scarcely, perhaps, so highly coloured as we have seen it in former years.

Mr. Carson, gr. to W. F. G. Farmer, Esq., produced—

Burlingtonia fragrans	Epidendrum aloefolium
Brassia verrucosa	,, crassifolium
Cœlogyne asperata	,, h.xipetalum
Calanthe veratrifolia	Maxillaria tenuifolia
Camarotis purpurea	Odontoglossum hastatum
Cattleya Mossiæ	Phalænopsis amabilis
Cypripedium barbatum	,, grandiflora
Dendrobium Devonianum	Saccolabium guttatum
,, fimbriatum	,, retusum
,, nobile	Zygopetalum rostratum

Of these the Purple Camarote was a large and finely grown plant, but it was not sufficiently in bloom to be effective; in this respect it was greatly excelled by the spotted Saccolabe, which was just at its best, its charming flower spikes, some 14 in number, being in beautiful order. The uncommon colour, rather than the beauty of the Long-petalled Epidendrum, attracted the attention of many; the Aloe-leaved species of this genus was a good specimen of a somewhat common plant. The Moss Cattleya was very finely flowered.

A collection of 15 ORCHIDS, shown by Messrs. Rollisson, consisted of—

Aerides virens	Dendrobium nobile
Anguloa Ruckeri, var. sanguinea	Epidendrum crassifolium
Brassia maculata	Odontoglossum hastilabium
Cattleya Aclandiæ	,, nævium
,, Mossiæ	Oncidium sphacelatum
Dendrobium Dalhousianum	Phalænopsis grandiflora
,, fimbriatum	Sobralia macrantha
	Vanda teres

The Anguloa was the beautiful variety which was fully described a week or two ago at p. 271. One of the most remarkable plants in this group was the Moss Cattleya, whose large blossoms were both numerous and fine, the lip possessing more orange yellow than is to be found in some of the many varieties of this species. Oncidium sphacelatum was also a noble example of what this Oncid is when "well done;" and the spotted Brassia, though not generally considered handsome, was really so in this instance, on account of the profusion and clearness of colour of its blossoms. The Sobralia had five large purple flowers on it. Dendrobium nobile was a good specimen, as was also the Epidendrum crassifolium, which had on it, altogether, some 15 flower spikes.

In groups of 10 ORCHIDS, Mr. Dods, gr. to Sir J. Cathcart, Bart., was first with—

Brassia caudata	Oncidium altissimum
Dendrobium densiflorum	,, ampliatum majus
,, nobile	Phalænopsis grandiflora
,, Paxtoni	Saccolabium retusum
Epidendrum primulinum	Vanda tricolor

The Oncidium altissimum was a large specimen, but badly coloured. Vanda tricolor was a fair example of that species; but perhaps the most skilfully grown plant of the whole was Dendrobium densiflorum, which was ornamented with some 12 large bunches of its beautiful yellow flowers.

Mr. Green, gr. to Sir E. Antrobus, Bart., who gained the second prize, sent—

Calanthe veratrifolia	Epidendrum crassifolium
Cattleya Mossiæ	,, macrochilum
Dendrobium Calceolare	Oncidium ampliatum majus
,, nobile	,, sphacelatum
,, pulchellum	Maxillaria Harrisoniæ

In this collection, the Harrison Maxillaria was a good specimen, and well bloomed, as were also the two Oncids and the Dendrobium nobile.

Mr. Clarke, gr. at Highgrounds, Hoddesdon, was third. He sent—

Cattleya intermedia	Oncidium ampliatum majus
Cyrtochilum maculatum	,, luridum guttatum
Dendrobium densiflorum	Saccolabium retusum
,, fimbriatum	Vanda insignis
,, Paxtoni	,, teres

These were for the most part small plants, among which the most remarkable were perhaps the fringed Dendrobe and the intermediate Cattleya.

AZALEAS nearly filled one side of a long tent; and as the plants were mostly large and well flowered, the effect of such a bank of floral beauty of almost every tint and colour may be well conceived. The first prize was awarded to Messrs. Lane, of Great Berkhampstead, for 12 excellent plants of Perryana, Fielder's White, speciosissima, triumphans, conspicua purpurea (a very large flowered kind), Double red, exquisita, alba magna, punctata, grandis, mirabilis, and Broughtoni. These had been grown in the "natural style," and therefore there was a half constrained yet charming wild beauty about them which the next collection from Mr. Green did not possess, though it must be admitted that the flowers on the plants in the second group were better expanded and finer than those on the Berkhampstead collection. Mr. Green sent lateritia, coronata, Gledstanesi, decora, Perryana, Rawsoni, variegata, optima, triumphans, Symmetry, Præstantissima, and sinensis. The last named plant was literally a mass of yellow blossom. Mr. Over had also 12 good plants.—In the class of 6 varieties, Mr. Taylor was first, Mr. Roser second, and Mr. Peed third. Among these we remarked prettily flowered plants of Dilecta, Murrayana, Iveryana, a white kind with occasionally a purple stripe in it; semi-duplex maculata, Broughtoni (both Knight's and Smith's varieties), variegata, lateritia, Minerva, and Griswoodiana.

A small group of yellow RHODODENDRONS was produced by Messrs. E. G. Henderson, of the Wellington Road Nursery. Among these the most conspicuous were Burlingtoni, aureum superbum, and Broughtoni. The latter was, however, not yellow but buff, shaded with pink.

Of TALL CACTI, a small group was contributed by Mr. Green. It consisted of Epiphyllum coccineum, Jenkinsoni, speciosum elegans, crenatum, Ackermanni, and Greeni.

ROSES in pots, both from nurserymen and amateurs, were unusually fine. Those from Messrs. Lane, to whom the first prize was awarded, were extremely well grown, and the flowers were just in perfection, their proper colours being beautifully brought out. Among these the most striking were Paul Ricaut, particularly for colour; La Reine, Viscomtesse Decazes, the best yellow; Chenédolé, and Souvenir d'Un Ami. The best specimens in Mr. Francis's group, which was second, were Coupe d'Hébé, Juno, Adam, Pauline Plantier, Boucère, and Souvenir de la Malmaison. Among Messrs. Paul's plants we remarked Alette, Paul Perras, Lamarque, Coupe d'Hébé, and Madame Campbell, of Islay, in good condition. From the last-named firm also came a seedling something like Duchess of Sutherland, but more double, and very sweet.—Messrs. Standish and Noble had also two examples of new Hybrid Perpetual Roses—one named Gloire de France, the other Jules Margottin, both good kinds, but not distinct enough from varieties we have already.—In the class of private growers, Mr. Busby had Géant des Batailles, very good, but past its best; also Solfaterre and Paul Perras, good; but the best, perhaps, was Coupe d'Hébé.—From A. Rowland, Esq., of Lewisham, came Paul Perras and Coupe d'Hébé, rather in advance of the rest, all of which were very evenly and well grown.—Mr. Sage, gr. to Mrs. Robinson, sent a group of small but compact plants, in which the most conspicuous were Géant des Batailles, Duchess of Sutherland, Louis Bonaparte, and Baronne Prevost.

CAPE HEATHS were numerous, and generally beautifully in flower. Excellent large plants were furnished by Messrs. Rollisson, Jarvis, and Peed, and smaller ones by Messrs. Roser, Over, and Pamplin. Among the different varieties we remarked Hartnelli, denticulata moschata, ventricosa coccinea minor, intermedia Sindryana (a fine upright-growing kind, which is not so well known as it should be), propendens, perspicua nana, vestita rosea, elegans, vasiflora, Beaumonti, dilecta, favoides, elegans, Cavendishi, suaveolens, Macnabiana, mundula, fastigiata lutescens, nitida, several varieties of tricolor, aristata, and other sorts, the flowers on all of which, owing to the late sunny weather, were extremely well coloured, and therefore they were altogether unusually attractive.

Of SINGLE SPECIMENS, the best were Vanda suavis, in beautiful condition, from Messrs. Veitch; Gompholobium polymorphum, from Mr. Dods; and Ixora coccinea, from Mr. Clarke. We also remarked an Everlasting from Mr. Carson, a large Rhynchospermum jasminoides from Mr. Gilham; Adenandra fragrans and Erica depressa from the Exotic Nursery, Chelsea, and the last named variety of Cape Heath from Mr. Busby, gr. to J. Crawley, Esq.

NOVELTIES were few. The most remarkable were a pale salmon-coloured Indian Rhododendron, and the woolly-stemmed Lady's Slipper (Cypripedium villosum), from Messrs. Veitch; and Hedaroma (Genetyllis) tulipiferum, from Messrs. Garaway & Co., of Bristol. Others consisted of the Yellow Hexacentris (H. lutea), from Messrs. Veitch; small examples of Eucharis candida, Boronia Drummondi, and a pink Clerodendron called Bungei, from Messrs. E. G. Henderson; Rhododendron Gibsoni, hirsutum, a small-leaved hybrid with little white flowers tinged with pink, from I. Anderson, Esq., of Edinburgh; Clematis monstrosa, a large white-flowered kind, and also a pale blue variety in the way of C. azurea grandiflora, from Messrs. Jackson. A variety of Cattleya Mossiæ, from Mr. Carson; well-flowered examples of Cantua dependens, and Rhododendron javanicum, from Messrs. Lane; and the Edgeworth Rhododendron, and small plants of Azalea narcissiflora, from Messrs. Standish and Noble.

Among MISCELLANEOUS SINGLE PLANTS, the best were a Geranium-coloured Rhododendron, called formosum elegans, from Messrs. Veitch; the white pink-striped Azalea Iveryana, from Messrs. Lee; and Oncidium Papilio from Mr. Busby.

A collection of MISCELLANEOUS PLANTS, chiefly variegated, or otherwise remarkable for fine foliage, was contributed by Messrs. E. G. Henderson. It consisted of various Jacarandas, Rhopala magnifica and complicata; Cibotium glaucum, Asplenium Belangeri, Darea diversifolia, Nephrolepis Davalloides, a variegated Hoya, Plectranthus concolor pictus, Caladium pictum, variegated Yuccas, Mussænda frondosa, Maranta albo-lineata, variegated Pine-apple, Pavetta borbonica, Pandanus javanicus variegatus, the red-streaked Draceena ferrea, and nobilis; Dieffenbachia maculata, and the orange-veined Cossignia borbonica.

From the last-named firm also came an interesting group of soft-wooded plants, consisting of variously coloured Tree Carnations; examples of the Pompone Chrysanthemums Andromeda, Regulus, and Orion, as finely in bloom now as they usually are in September; different kinds of Variegated and Fancy Pelargoniums, and a variety of Hydrangea, with leaves blotched and striped with white. Mr. Twigg showed some Mimuluses, all good and showy kinds.

PELARGONIUMS were few; but on no former occasion have we seen them in better condition. Those produced by Mr. Dobson, of Woodlands Nursery, Isleworth, were in all respects very excellent examples of skilful cultivation, the plants being neither too large nor yet too small, very symmetrical in shape, and the flowers all fresh and most beautifully coloured. This group received, as it well deserved, the first Gold Banksian Medal. The varieties were Ambassador, Rosamond (with 150 expanded trusses), Delicatum (fine white, with nearly the same quantity of trusses), Vanguard, Gulielmus, Arethusa, Glowworm, Governor, Purpureum, Harriot (one mass of bloom), Leah, and Vulcan. The last-named flower was greatly admired for its fine colour. In Fancy Pelargoniums Mr. Mockett, gr. to J. Allnutt, Esq., of Clapham, was 1st, with nicely flowered plants of Richard Cobden, Cleopatra, Defiance, Jehu Improved, Princess Alice Maude, and Captivation.—Mr. Gaines, of Battersea, was 2d with the following, which were not fully in bloom—Signora Castoni, Defiance, Queen Superb, Madame Rosati, Delicatum, and Electra.

Of FRUIT there was a display on this occasion, such as we have never seen before in May, and with very few exceptions all of it was quite ripe and well coloured.

The first Gold Banksian Medal was awarded to Mr. Fleming, gr. to the Duke of Sutherland at Trentham, for a very fine collection consisting of Black Hamburgh and Muscadine Grapes, a Black Jamaica Pine-apple, May Duke Cherries, very large and beautifully coloured; Elruge and Murray Nectarines, Royal George Peaches, and Trentham Hybrid white-fleshed and green-fleshed Melons. The second Gold Banksian Medal was awarded to Mr. Clements, market gardener, Oak Hill, East Barnet, for Sweetwater and Black Hamburgh Grapes, the latter remarkably large and well coloured; four Queen Pine Apples weighing respectively 3 lbs. 2 oz., 2 lbs. 12¾ oz., 2 lbs. 9 oz., 2 lbs. 7½ oz.; and four Providences weighing 7 lbs., 6 lbs. 11½ oz., 6 lbs. 4 oz., and 6 lbs.

Of PINE-APPLES, Mr. Turnbull, gr. to the Duke of Marlborough at Blenheim, sent a very fine Cayenne weighing 4 lbs. 14 oz., and a Lemon Queen 3 lbs. 13 oz. Mr. Jones, gr. to Lady Charlotte Guest, had a Ripley Queen 4 lbs., and Mr. Jennings, gr. to the Earl of Derby at Knowsley, a Jamaica 3 lbs. 5 oz. Other sorts consisted of a Queen, 3 lbs. 8 oz., from Mr. Barron, gr. to J. H. Vivian, Esq.; two Providences, each 6 lbs. 12 oz., from Mr. Gray, gr. to the Earl of Zetland; a Providence from Mr. Stewart, gr. to the Marchioness of Londonderry; a Moscow Queen from Mr. Smith, Market Gardener, Isleworth; and a Black Jamaica from Mr. Ogle, gr. to the Earl of Abergavenny, at Eridge Castle, Tunbridge Wells.

GRAPES.—Mr. Martin, gr. to Sir H. Fleetwood, Bart., sent beautiful bunches of Black Frontignans, Sweetwater, and Black Hamburgh. Mr. Breadley, gr. to S. M. Peto, Esq., had Black Hamburgh and White Frontignans, both good. Mr. Jennings sent Black Hamburgh and Dutch Sweetwater. Mr. Forbes, gr. to the Duke of Bedford, at Woburn, Black Hamburgh; Mr. Mitchell, of Brighton, a fine basketful of the same variety, beautifully coloured; and Mr. Spencer, gr. to the Marquis of Lansdowne, at Bowood, Mr. Spary, of Brighton, and Mr. Dods also had Black Hamburgh, in excellent condition. Other examples of this Grape came from Mr. Henderson, gr. to Sir Geo. Beaumont, Bart.; Mr. Stewart; Mr. Ivison, gr. to the Duke of Northumberland, at Syon; Mr. Ogle; Mr. Jackson, gr. to G. Beaufoy, Esq.; and Mr. Kately. Of other Grapes, Mr. Spencer sent good bunches of Chasselas Musqué; Mr. Turnbull, Grizzly Frontignan; Mr. Breadley, White Frontignan; and Mr. Jackson, Sweetwater.

PEACHES.—A dish of Noblesse was exhibited by Mr. Stewart, gr. to the Marchioness of Londonderry, and another of Royal George by Mr. Wingfield, gr. to W. H. Bracebridge, Esq.

STRAWBERRIES were numerous, large, and finely coloured. The sort which attracted most attention was a seedling called Sir Charles Napier, an extremely fine looking fruit, conical in shape, and about as large as the British Queen, which it greatly excelled in colour, being one uniform glowing red, even to the very point. We understand, however, that it proved to be so badly flavoured, that the judges could not give it any award. It was exhibited by Mr. Smith, of Isleworth, who had also excellent examples of British Queen, both gathered and in pots. Mr. Turnbull, gr. to the Duke of Marlborough, had British Queen and Keens' Seedling; Mr. Ivison, Keens' Seedling; Mr. Ironmonger, gr. to S. R. Heseltine, Esq., and Mr. M'Ewen, gr. to the Duke of Norfolk at Arundel, British Queen; Mr. Dew, of Ham, Keens' Seedling; and Mr. Simpson and Mr. Goodall, Keens' Seedling. Mr. Bucktrout, gr. to W. L. Gower, Esq., had Princess Alice Maude; Mr. Judd, gr. to Earl Spencer, British Queen; Mr. Breadly, British Queen, and Mr. Hibbins, gr. to E. C. Seaman, Esq., Keens' Seedling in pots. From Mr. Patterson, of Thame Park, Oxon, came a seedling called Patterson's Scarlet Nonpareil, which looked as if it would be an acquisition.

CHERRIES.—Very good dishes of May Duke were contributed by Mr. Shuter, Mr. Jennings, Mr. Jackson, Mr. Fleming, Mr. McEwen, and Mr. Wilson, of Warwick. These were all large and well coloured.

FIGS were produced by Mr. Busby and Mr. Judd, both exhibitors showing Brown Turkey.

Of MELONS, the best were Snow's Prolific Green-fleshed, from Mr. Scrogie, Southill Gardens, Bedfordshire; and Victory of Bath, from Mr. Grant. Other sorts were Austin's Incomparable, and Knight's Hybrid Green-fleshed.

Of rare fruits, Mr. Ivison furnished a dish of Loquats.

BOTANICAL OF EDINBURGH, *March* 9.—The President in the chair.—Dr. Balfour exhibited under the microscope specimens of porous and true punctated tissue in coal, and he noticed the formation of coal by Sigillarias, and the presence of scalariform tissue in such coal.

Mr. M'Nab exhibited various cut roots of trees which had been transplanted by Mr. M'Glashen's apparatus a year ago, and which showed tufts of fibrils varying from 7 or 8 inches to 1½ foot in length, produced from the cut extremities. Dr. Balfour remarked that this plan of transplanting had been very successful, that cutting the roots did not appear to operate in arresting growth, and that the objection urged by some, that plants were likely in such circumstances to exhaust their energies in the production of flowers and fruit, had not been verified. The plan of at once transplanting the trees after their roots were cut, and allowing them to form young rootlets in their permanent position, seemed preferable to the plan of cutting the roots the previous season by trenches, to induce the formation of roots, and then running the risk of injuring these by the after removal. The following papers were read, viz. :—
1. *On the Pollen of Zamia horrida.* By Dr. Balfour.
2. *Notice of the Muscology of the East Coast of Fife.* By Rev. T. Brown.
3. *Note on the supposed Antheridia of the Rhamneæ.* By J. S. B. Sanderson, M.D. Dr. Sanderson, after a careful examination of the buds of various species of Rhamnus, particularly of R. catharticus, considered that the bodies supposed by Grisebach to be antheridia were not so, and that the club-shaped organs described by him differed from antheridia in not being developed from a single special mother cell, in not possessing a central cavity at any period of their growth, and in containing a resinous secretion. He could not detect the "long-tailed globules enclosed in minute spherical cells" described by Grisebach as oscillating in a very lively manner.
4. *Register of the flowering of certain hardy plants in the Royal Botanic Garden from 9th February to 7th March,* 1854. By Mr. M'Nab. Feb. 12, Alnus glutinosa ; Feb. 14, Galanthus plicatus, Tussilago alba, Sisyrinchium grandiflorum, Crocus susianus ; Feb. 15, Arabis albida, Leucojum vernum ; Feb. 18, Rhododendron atrovirens, Daphne Mezereum ; Feb. 20, Erica herbacea, Daphne Laureola ; Feb. 21, Cornus mascula ; Feb. 23, Garrya elliptica ; Feb. 24, Potentilla fragariastrum ; Feb. 27, Primula denticulata; Feb. 28, Knappia agrostidea, Ranunculus ficaria ; March 1, Lamium garganicum, Nordmannia cordifolia ; March 2, Rhododendron nobleanum ; March 3, Symplocarpus fœtidus ; March 4, Primula nivalis ; March 7, Vinca minor. Mr. Evans stated that the Apricot opened its first flowers in the Experimental Garden on the 4th inst.
5. *On the Anatomical Structure of Coniferæ and other Gymnogens.* By Mr. G. Lawson. The author remarked that he had recently been engaged in the examination of the minute anatomy of Gymnogens, and after alluding to the peculiarities of structure that had drawn towards these plants the attention of all physiologists, he proceeded more particularly to detail his observations on the anatomy of their wood cells. The structure and development of the wood cell had been well elucidated by Hugo von Mohl in various papers in the "Annales des Sciences Naturelles," and in his work on the "Vegetable Cell," but there was one aspect in which the subject had not been so fully viewed as appeared desirable. Mr. Lawson's examinations had been undertaken principally for the purpose of ascertaining in how far the peculiarities in the minute anatomy of the Coniferæ coincided with their general structure, and might be depended upon in the determination of their orders, genera, and species—an inquiry from which fossil botany and investigations relative to timber were likely to derive advantage. After detailing the general structure of the wood cells of Coniferæ, and pointing out peculiarities that occurred in various plants of the order, he described a remarkable modification which had been noticed in the Yew, viz., the presence in the wood cell of what appeared to be a spiral fibre, but which had been shown by Harting to be a connected pellicile with thickened ridges arranged in a spiral manner. Mr. L. had found this structure to be by no means so rare as had been supposed, and although principally confined to plants belonging to Taxaceæ, it was stated not to be universal in that order, nor peculiar to it. He had observed it in the following plants :—Cephalotaxus Fortuni, C. pedunculata, C. tardiva, Torreya taxifolia, T. nucifera, Taxus baccata, T. canadensis, Podocarpus japonica, P. koraiana, Abies Douglasi, Fitz-Roya patagonica. It also occurred in a specimen of Pine wood from N. California, which presented interesting microscopical characters, but which he had been unable as yet to identify. This structure was not to be confounded with the faint spiral streaks seen under a high power on the secondary membrane of the wood cells of many Coniferæ. It had been long a question whether true punctated tissue was strictly confined to Gymnogens. A careful examination of Drimys granatensis and other plants had led Mr. L. to believe that the discs which occurred in aromatic trees were essentially the same as those of Coniferæ, and indeed accorded in a remarkable manner with those of many Araucariæ and Taxaceæ, in which the central dot was not circular, but formed by two elliptical slits crossing each other. The manner in which this appearance arose was fully explained by a reference to the spiral arrangement of the slits, which also seemed to account for the alternation of the discs in Araucaria. In the determination of fossil plants and of unknown timbers, Mr. Lawson believed that valuable characters were afforded by the peculiarities of the wood cell, such as its general size, presence or absence of a spiral tertiary membrane, arrangement of discs (alternate or opposite), their distance from each other in different directions, and whether in single, double, treble, or quadruple rows on each cell ; absolute size of the disc, and its breadth as compared with that of the cell ; form of disc, whether circular, elliptical, or angular, or a combination of these forms ; form of central dot, and (if not circular) direction of the same. The cells of the medullary rays, and the pits in connection with them, also afforded useful marks of distinction. By aid of the above characters, to which many more might be added, Mr. L. had been able to mark distinctions between timbers whose appearances to the naked eye presented no definite characters. It was of great importance, however, in adopting such distinctions that we should also retain the other means of investigation we possess, and his present attempt was meant not to displace but to supplement these. Specimens of timber were exhibited, including Wellingtonia gigantea, which Messrs. Veitch of Chelsea had kindly sent through Mr. Evans ; under the microscope it presented a double row of opposite discs, which, as well as their central dot, were elliptical.
6. *On Ophioglossum lusitanicum Linnæus.* By Mr. T. Moore, F.L.S. The author remarked :—"The discovery of the Ophioglossum lusitanicum L., within the politico-geographical limits of Great Britain, so soon after that of the Gymnogramma leptophila, another S. European Fern, is a fact of much interest. The existence of this curious little plant in Guernsey was first discovered in January of the present year by Mr. Wolsey, who met with it above the rocks bordering on Petit Port Bay, in that island. The first public notice of its discovery was by Mr. J. Smith, of Kew, in the *Gardeners' Chronicle* of January 28, 1854. One remarkable feature of the plant is the very early period of the year at which its growth is made. By the middle of January Mr. Wolsey found it to be fully developed, and the fronds no doubt perish early in the spring. The range of this Ophioglossum appears to be extensive ; for it is recorded to inhabit the sandy coasts, both of Europe and Africa, washed by the Mediterranean Sea, including those of Sardinia, Sicily, Greece, Naples, France, Spain, Portugal, and Algeria ; and to extend to the Canary Islands and Madeira in the Atlantic Ocean. It is not improbable that a diligent search might be rewarded by its discovery in the western counties of England or in Ireland. Its early development and speedy decay should, however, be borne in mind by those who may undertake the search."—An extract was read from a letter by Mr. D. Menzies, gardener, Gala House, relative to a *Norway Spruce tree* recently struck by lightning :—"It was 63 feet high and 4½ feet in circumference, at 13 feet from the ground. The stem was broken through at about 27 feet from the ground, and, with the exception of splintering on one side, was broken pretty nearly across. The broken ends, upon examination, appeared as if severely crushed, and very open. The other parts of the trunk were uninjured, and no difference was observed on the branches. The day was perfectly calm, and I cannot conceive the tree to have been broken by any other means, having seen it immediately after the thunderstorm."

Notices of Books.

The Micrographic Dictionary ; by Dr. Griffith and Mr. Henfrey. Van Voorst. Part I.—This, if well executed, may be useful to the numerous amateurs who are now-a-days indulging in the use of the microscope. In such a work, however, the purchaser has a right to expect the illustrative plates to consist of original figures, unless he is expressly warned to the contrary, This is not the case ; and of the wood-cuts we presume to say that while that of Adiantum (p. 13) is execrable, some of the others are not such as we looked for in a work published by Mr. Van Voorst. Nor can we say that we are quite satisfied with the letter-press. What, for instance, have Acrocarpi, Acaulon, Acroperus, Acrosticheæ, &c., to do with Micrography in the proper sense of that needless term ?

New Plants.

64. HEDAROMA TULIPIFERUM. Genetyllis tulipifera *of gardens.*

H. tulipiferum : foliis oblongis obtusis sessilibus decussatis margine cartilagineo denticulato cinctis, involucro sessili obovato cernuo petaloideo multifloro basi foliaceo stigmatibus barbatis longiore, filamentis sterilibus minimis acutis.

A bush of this remarkable plant was exhibited at the last meeting of the Horticultural Society by Messrs. Garaway and Co., of Bristol, who received a silver medal for it. In appearance, when out of flower, it much resembles some broad-leaved *Diosma*, or rather, perhaps, *Pimelea decussata.* Its apparent flowers are terminal, drooping, greenish white, sessile cups, about 1½ inch deep, stained with dull red, and passing at the base into leaves; but the real flowers stand in a crowd within the base of the cup, which is an involucre. Each flower is enclosed by a pair of broad, carinate, fragrant scales, stained with deep crimson over the upper half. They have the same structure as those of *Hedaroma latifolium* (*Appendix to Bot. Register*, p. v.i.), except that their tube is marked by five furrows ; the calyx lobes are minute, rounded, and obsolete, and the sterile stamens mere crimson points. It is a New Holland plant, introduced by Mr. James Backhouse, of York. The flowers of the specimen exhibited were as dull in colour as *Clematis cirrhosa*, but we incline to believe that in the hands of some of our great cultivators the white would become clear, and the dull red brilliant, in which case this would really deserve the name of the "Tulip-bearer." It should be compared with *Genetyllis macrostegia* of Turczaninoff.

FLORICULTURE.

THE PERPETUAL OR TREE CARNATION.—The appearance of a few plants of this charming flower at the exhibition of the Horticultural Society at Chiswick on Saturday last, reminds me that a few remarks respecting it at this season may possibly prove useful. This variety is commonly called the Winter-flowering Carnation, from the desirable characteristic it possesses of blooming throughout that season. The name of Tree Carnation may be familiar to some, as the plant itself is not of recent introduction, although very few varieties seem originally to have been known, and those have now been entirely superseded by sorts lately imported ; for it is our continental neighbours who have been so successful in raising them, and to whom we are principally indebted for these invaluable acquisitions ; for not only are the varieties now more diversified in colour, but their growth and habit are altogether improved. In addition to their bright and varied colours, they are deliciously fragrant, a desideratum which cannot be too highly appreciated, some of the varieties being equal in perfume to the common Clove. Persons desirous of cultivating this tribe of Carnations should procure nice young plants, say in March, and keep them in a cool frame until the weather permits them to be exposed entirely to the open air ; but, even in spring the lights should be taken off whenever it is practicable. Those who have old plants should strike cuttings about the middle of March, as young plants grow rapidly throughout the summer, and make by far the best specimens for winter blooming. Before taking cuttings, the plants should be put into a warm house, or one that is kept rather close ; and those who have not this convenience should put them in the warmest part of the greenhouse ; if this is done, the plants are excited to grow, and if the cuttings are then taken off, they will strike root more readily. Care should be taken to strike only from vigorous plants, and to select strong and healthy cuttings ; for if this is not done, and the cuttings are taken from delicate and cankery plants, the colours of some of the varieties are inclined to run, besides which, the plants always maintain a sickly appearance. Tree Carnations will supply an abundance of cuttings, as most of the varieties continually throw out a profusion of laterals, which can be taken off at any season without injury to the parent plant; indeed, taking a few of them off in autumn has rather a tendency to strengthen the flowering shoots than otherwise. To insure cuttings taking root, either late in autumn or in spring, they must be struck in a little heat, but the cutting pots should not be covered with a glass, for if this is done, the cuttings will fog or damp off ; besides which it is not necessary ; and if no glass be used, they will want occasionally looking over, and any Grass carefully removed that is likely to create damp. After the cuttings are well rooted they should be potted singly into, say, 4-inch pots, and kept in a rather close and moist atmosphere until fully established, when they should be gradually hardened off in a cool frame. At this stage the tops may be pinched out, which will greatly assist the formation of nice plants. To those who have not the convenience of supplying warmth for striking cuttings during winter, I should recommend their being struck at the latter end of summer, to be potted off and kept in a cool frame during the winter, care being taken to keep them rather dry—a rule which should always be observed in wintering Carnations. The cutting pots should be prepared by first giving a good drainage of any sherds of a porous nature, then a few rough pieces of turfy loam to prevent the soil from being carried through the sherds; after this, take equal proportions of loam and silver sand, mix together, and fill until within a quarter of an inch of the rim, then complete by filling up with silver sand. Tree Carnations will thrive luxuriantly in a good maiden soil or loam mixed with a little silver sand, to which may be added a slight sprinkling of leaf-mould ; the same soil may be used throughout the season, except when the plants are first shifted from the store pot, when a little more silver sand should be used. In spring the plants should be removed from the frame, and placed upon an open border, in any favourable situation ; but first prepare it by spreading a thin layer of ashes, which will prevent worms from entering the pots. If at this time the plants require potting, a shift should be given them, but care must be taken not to over-pot them. I find that many varieties thrive better if gradually shifted into their blooming pots, say first from 3-inch into a 6-inch pot, and so on in proportion. The plants are comparatively no trouble during summer ; they merely want watering, and sometimes stirring up the surface soil ; but as they grow, care must be taken to secure the stems nicely with some neat sticks. The principal insects that attack them are green fly ; which is easily removed by sprinkling with a little tobacco-water. If the weather and situation prove excessively hot in the summer, the plants may be removed with advantage to a border that is slightly shaded from the mid-day sun. If the above mode of treatment is followed, by the autumn the plants will have thrown up from three to eight stems each, and be laden with a profusion of buds, which, if the plants are removed to a greenhouse as soon as the weather is beginning to get damp and cold, will expand, and afford a continuance of blossoms throughout the winter. These Carnations are not only valuable for their display in the greenhouse, but are, I may say, unequalled as a winter flower for the bouquet and

other purposes to which cut flowers are applied. The following are the names and colours of 12 of the best and most distinct varieties:—Attila, scarlet and white flake; Belle Zora, salmon pink, striped and mottled with crimson; Cassandra, bright cerise; Gertrude, lavender, mottled with white; Incomparable, deep rose, striped with crimson; La Sernii, blush white, mottled with rose; La Vestale, scarlet self; Le Zephir, purple; Madonna, blush, striped, and mottled with crimson; Proserpine, large dark crimson; The Baron, white, mottled with rose on the edge; Union, crimson, mottled with white. *W. B.*

SEEDLINGS.

CINERARIAS: *J E.* 1 is a large bold flower, in the way of Cerito; and, although the petals are perhaps a little too ribby, it deserves cultivation. 2 is not so good as many white sorts we already have.

PELARGONIUMS: *R J L.* Good in colour, but too small, and otherwise defective, ever to be a favourite.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—As the New Holland plants go out of bloom the seed pods should be picked off, the shoots cut back and arranged in the form most favourable to secure a compact growth, placing them in an airy part of the greenhouse until they fairly start into growth. When the buds have fairly started will be the proper time for shifting such as require more pot room, as they can then be kept somewhat close for a fortnight to encourage a free root action, without incurring the risk of the buds breaking scantily. Look well to the stock of plants for summer and autumn decoration, and do not allow them to sustain any check through want of pot room, or carelessness in watering. The Croweas are first-rate subjects for this purpose, remaining longer in beauty than almost any other hard-wooded plant which we possess, and are not nearly so much used as they should be. Fuchsias for late blooming must not be kept too warm, but should be placed in a moist, cool, shady house, where they will grow much more freely than in a high temperature. STOVE.—The plants here will now be growing very freely, and will require frequent attention as to stopping, training, &c. Keep them properly supplied with pot room, and afford them all the sunshine that they will bear without scorching, with a moist atmosphere, admitting air freely on mild days. Also afford them sufficient space for the perfect development of their foliage. Carry on an incessant war with insects, and attend to cleanliness, washing the house, pots, &c., as may be necessary to ensure this. Go over creepers frequently, so as to direct their growth and prevent their getting into interminable confusion, which, without attention, will soon be the case. Syringe and shut up early on the afternoons of bright days, and be as sparing as possible in the use of artificial heat. ORCHIDS.—Afford those in growth a thoroughly moist atmosphere, giving them a good steaming every bright afternoon, by syringing and shutting up early. Admit air in moderate quantities on mild soft days, but carefully avoid currents of drying wind. Examine the plants individually every other day, and water such as require it, but be careful not to give too much to those starting into growth, and a cool atmosphere will greatly assist in prolonging the beauty of those in bloom.

FORCING DEPARTMENT.

PINERY.—Plants swelling their fruit should be divested of all suckers except as many as may be absolutely wanted for stock. This will throw more of the energies of the plant into the fruit, and will also tend to strengthen the suckers left. Guard against any decline of the bottom-heat, or allowing the soil to become either too dry or too wet, so as to avoid any check which would be highly injurious to the swelling of the fruit. Give manure water liberally whenever the soil becomes dry, and maintain a regularly moist atmosphere. VINERIES.—Go over the Vines frequently, for the purpose of stopping the laterals, and preventing their shading or interfering with the more valuable foliage. Where there exists a necessity for growing plants under the Vines, the latter should be kept sufficiently thin to allow of a moderate share of light reaching the plants. Keep a sharp look-out for red spider, and use every possible means to eradicate it the moment it is perceived. Where plants are grown under the Vines, see that they are not infested with black thrips, which, if once allowed to get upon the Vines, is vastly more destructive and difficult to eradicate than red spider. Attend to the thinning of the fruit in succession houses immediately the berries are fairly set, and thin bunches and berries freely; for, depend upon it that a moderate crop of first-rate fruit will be more creditable to the gardener, and satisfactory to the owner, than a larger quantity would be if obtained at the expense of quality. The proper quantity to be left must, however, be regulated entirely by the strength of the Vines, &c. PEACHES.—There is no fruit which is so deficient in flavour and so thoroughly worthless, if ripened in a close moist atmosphere, as Peaches and Nectarines; therefore admit air freely whenever the ripening process is observed to be commencing; and unless the fruit is fully exposed to light and sunshine they will be deficient in colour, hence the shoots should be neatly tied in previous to the ripening period, in order to fully expose the fruit to the free action of the sun's rays. Endeavour to have the border in a healthy state as to moisture, while the fruit is ripening.

FLOWER GARDEN AND SHRUBBERIES.

Recently transplanted shrubs and trees must be carefully attended to with water until they get fairly established. It is frequently the case, however, that too much water is given at the root, thereby souring the soil and rendering it uncongenial to the young rootlets and the aftergrowth of the plants. The soil should be kept moist, but not to saturation, and the plants should be watered over-head with the engine on the evenings of bright days, which will be of vastly more service in repairing the loss sustained by evaporation than if given in excess to the soil while there is a deficiency of active rootlets to absorb it. Where Roses are infested with the grub, it will be necessary to go over the plants frequently, to destroy this pest. Green-fly is also sometimes very troublesome at this season; a good washing with the garden engine on two or three successive evenings will greatly assist in getting rid of these destructive vermin. With the wind due north, and a fair prospect of a sharp frost any night, there is no irresistible temptation to commence bedding out in good earnest. It is to be hoped, however, that we shall have experienced a favourable change before the appearance of this notice, and that the planting of all properly prepared stock may be proceeding under favourable auspices. Begin with Calceolarias, Verbenas, Scarlet Geraniums, &c., leaving Heliotropes, Lantanas, Anagallis, and such things as are easily injured by frost, until planting of the more hardy kinds is completed. Branches of evergreens are easily enough obtained about most places, and a sprinkling of these stuck into the beds after planting will be of great service in protecting the plants from the drying effects of bright sunshine, and will also ward off a degree of frost which, to unprotected plants, would be destructive. All shoots which are long enough to be injured through being blown about by the wind, should be pegged down immediately on planting out, and a good watering should be given to the bed to settle the soil about the roots; this, however, will be better done early in the morning, if there is any reason to fear frost.

FLORISTS' FLOWERS.

The warm dry weather hastens the bloom of Tulips. If for exhibition careful shading will be requisite; on the main bed the awning of course will be sufficient; but on side beds, where individual flowers only require it, a wooden or glass shade should be put over them, covering with a large Rhubarb leaf. To retard the flower, a little moss may be placed on the surface of the soil and kept moist. Attend to cross breeding. Choose clean finely shaped flowers, but never cross a yellow with a white ground variety. Carnations and Picotees will require constant attention as to water, and tying up the shoots regularly as they spindle, and relieving any previously tied which may be too tight. Water Ranunculuses between the rows in the evening; also Dahlias. Pinks require a good deal just now; it aids their lacing. Place Auriculas and Polyanthuses in their summer quarters.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Persevere in the destruction of insects on fruit trees, in order to afford the young shoots a fair chance to make healthy growth; also proceed with disbudding and stopping gross shoots. See that recently transplanted trees are not allowed to suffer through want of water. Look after the caterpillar on the Gooseberry trees. The quickest way of getting rid of this pest is to give the trees a heavy washing with a powerful engine, throwing the water against the under sides of the leaves, which will wash off the caterpillars, and they are readily killed on the ground by means of an iron rake. Get trenches filled with some fermenting material in readiness for Cucumbers, &c, and expose the plants rather freely to light and air, to prepare them for planting under the protection of the hand-glasses. If not already done, see to sowing plenty of Sweet Basil, Savory, &c., on a warm border of light rich soil. Persevere in the destruction of weeds, and keep the surface of the ground frequently stirred among growing crops.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending May 18, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 23d, 1847—therm. 89 deg.; and the lowest on the 25th, 1839—therm. 29 deg.

Notices to Correspondents.

AZALEAS: *South Derbyshire.* We have no means of ascertaining why your plant has not flowered. The leaves seem to be healthy. It is always best to pull off the young fruit from all American plants; this should be done as soon as the flowering is over. Probably, your Azalea will flower all the better next year, from having missed this, unless it is out of health. Your plant is Saxifraga granulata.

BOOKS: *J J M.* Endlicher's "Synopsis Coniferarum" was published in 1847, by Scheitlin and Zollkofer, and may be procured through any foreign bookseller. We suppose its price to be about 10s. You will find the nomenclature by which we abide in the Journal of the Horticultural Society, vol. v., p. 129. Abies, Cedrus, Larix, and Picea, are mere sections of the genus Abies.

CALCEOLARIAS: *L K W H.* We have not received the specimens in question, nor indeed any Calceolarias of any kind. ‡

CONIFERS: *Tyro.* They should not be tied up at all. Let them alone and they will straighten themselves, except such as are naturally weepers, and you would not wish to alter their natural habit.

DISEASES: *H W B.* All the cuttings which you have forwarded seem to be affected in the same way, the portion only which is plunged in the soil exhibiting symptoms of decay. We do not find the slightest trace of any fungus, nor is it probable that the injury is due to such a cause, as the aërial portions of the plants are unaffected. The sand appears to be unobjectionable, but we observe that leaves of Sphagnum are attached to the base of every specimen, and if you are in the habit of mixing comminuted Moss with your compost it is a very hazardous plan, and extremely likely to retain water in the soil in a state prejudicial to vegetation. The presence of the Moss, however, may be merely accidental, and we know that out of a number of pots drained in the same way and filled with the same compost, a number will be perfectly pervious to moisture, while the rest will always be water-logged, and the surface overgrown with Vaucheria or Microcoleus, to the destruction of everything that is placed in them. If your soil is really covered with the mycelium of some fungus, it must be because there is some imperfectly decomposed vegetable matter mixed up with it; but perhaps you speak only in popular terms, and the Spider's-web belongs to some other division of Cryptogams. The fault will most probably be found to rest either on something in your compost, or on impervious or uncleansed pots. —*J G.* The disease with which the leaves of your Black Hamburgh Grapes are attacked is very singular. As far as we can judge from the single specimen which you have forwarded, the vascular bundles of the leaf are first attacked where they enter into it from the leaf-stalk, from whence the disease spreads through every ramification, affecting the parenchym in different points as it passes along. It is, therefore, probably the ascending sap which is in fault, and you must examine the state of the roots, and of the soil with which they are in contact, in order to detect the cause. If they are in communication with highly putrescent matter, whether animal or vegetable, there will be some reason to presume that the remedy is in your own power. It is impossible, however, to do more than suggest a cause, without the means of personal inspection.—*Rowland.* Your Cucumbers are affected precisely in the same manner as those adverted to in the *Gardeners' Chronicle*, 1847, p. 356, and the Melons, respecting which information was lately communicated by "P. S." Nothing can be more likely to produce such dropsical specimens than the comparative deficiency of light during the present spring, and yours is by no means a solitary case. You have, however, suffered before from the same disease, and if your seed is derived from the same stock, you will be likely to suffer again, however complete your arrangements may be, for nothing is more certain than that seed from a diseased source has a tendency to propagate disease, and that even where the malady is not simply constitutional, but dependent on parasitic fungi.—*C D.* The production on the leaves of Pinus Pinaster is Æcidium Pini. Such diseases, when once produced in perennial or arboreous plants, are very difficult of removal, and generally reappear for many years, as in the case of the Pear rust and many others. Your best consolation is that the disease is seldom injurious, except to young trees, and that not very frequently. *M. J. B.*

HEATING: *Sub.* We should certainly prefer 4-inch iron pipes to tanks, as a means of furnishing bottom-heat for Pines. They may be laid in shingle or rough gravel, over which the soil for the Pines should be placed. One or two short earthenware pipes may be put down through the soil to the gravel, in order to afford means of moistening the latter when necessary. ‡

INSECTS: *J W G.* The moth sent is the common puss moth, Cerura Vinula.—*Abel (something).* The "scale" on the Pear leaves are not scale insects, but the pupæ of the Pear hopper, Psylla pyri. Wash the leaves well with gas tar water, or tobacco water, and then syringe with fresh water. At a later period shake the branches or leaves over sheets of paper smeared with bird-lime, to which the winged insects will stick. The insect which injured the young shoots of your Dahlias is a millepede, Julus subterraneus. Entrap them by placing cuttings of vegetables on sticks underground, and examining them every other morning. *W.*

MESSRS. JOHN WEEKS AND CO.: *Sandgate.* It is not true that this respectable firm has found its way into the *Gazette*. The report is the very reverse of truth. The firm of Edward and Alfred Weeks is bankrupt, but those persons were not in any way whatever, directly or indirectly, connected in business with Messrs. John Weeks and Co. We trust that this statement will put an end at once to all misconception.

NAMES OF PLANTS: *William Dickson.* 1, Listera cordata, a great rarity; 2, Draparnaldia glomerata, a Conferva, not a Moss. (N.B. We cannot undertake to name any Cryptogamous plants except Ferns).—*Mary Anne.* 1, Cattleya Forbesi; 2, Epidendrum cuspidatum; 3, Oncidium confragosum.—*T B M.* Oncidium cornigerum, a fine thing.—*R F.* It is Kæmpferia pandurata.—*J S.* Eccremocarpus scaber.—*Norma.* 1, Bromus mollis; 2, Anthoxanthum odoratum; 3, Carex intermedia; 4, Holcus mollis. — *Mary.* Phytolacca icosandra. — *Flora.* Ranunculus parnassiifolius.

PREPAYMENTS: *A Constant Reader* complains, like others, of some of our advertisers, who, he says, "find it very convenient to stipulate for prepayment, but do not find it equally so to remember the obligations they thus lay themselves under." If a "Constant Reader" will favour us with his name in confidence, we will publish his letter, should he still find it necessary to complain. We trust, however, that the cases to which he alludes are susceptible of explanation.

VILLARSIAS: *A H.* It is true that reniformis and lacunosa are what you say; but what then? Unless you can give them a N. Jersey summer they are not likely to bear an English winter.

WOODS AND FORESTS: *Southampton.* We are as much in the dark as yourself as to the two persons, called referees, employed by the Treasury in its late proceedings. They are named in the Blue Book as Mr. Mathews, of Edgbaston House, Birmingham; and Mr. Murton, of Tunstall, Sittingbourne. Can you or anybody else tell us who and what they are? That there is something to be learned about them, important with a view to the public interests, we entertain no sort of doubt. Who recommended them to the Treasury?

MISC.: *Amateur.* An amateur is one who does not deal in plants.—*A C.* Will you kindly favour us with your name and address?

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general, to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204a, Upper Thames Street, London.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.
The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturist's London Agent, 1a, Bishopsgate Street Within.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.
"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.
To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

ADVERTISEMENT.

"BOYD'S SELF-ADJUSTING SCYTHE.—In your number dated April 29, I perceive a complaint from Mr. Henry Bailey, of Nuneham, Oxford, to the following effect:—'That having worn out the first set of blades while the handles were in all respects perfect, he desired his Ironmonger to procure more blades to attach thereto, but to his dismay was told that the patentees will not sell one part without the other.'
"As Inventor and Proprietor of the Scythe in question, I beg to inform your readers that although this regulation was adopted by me as necessary in the first instance (much to the opposition of my agents Messrs. W. Dray & Co.) I have lately been induced to alter the arrangement, in verification of which I beg to refer you to the Horticultural Society of Regent Street, who have recently received a supply of *two dozen blades* for the purpose of renewing those worn out.
"I take this opportunity of stating that my agents, Messrs. W. Dray & Co., of Swan Lane, will be happy to attend to the orders of Mr. Bailey, or any one else who may favour them with their commands, either for *blades* or handles, separately, or the implement in its complete state.—I am, Sir, your obedient servant,
"JAMES BOYD."
70, Lower Thames Street, May 20, 1854.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.
Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cliveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Bridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom, as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.
The Machine is made to cut the breadths of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.
Further particulars, with prices, may be had on application.

THE MOST PERFECT HAY-MAKING MACHINE YET MADE, which has been greatly increased in strength, durability, and lightness, weighing considerably less than other Haymakers, consequently the labour of the horse is much reduced. These qualities have been secured by substituting wrought iron for cast. The Machine is mounted on wrought-iron wheels, and is under the entire control of the person who drives. By merely pressing a spring lever, it is instantly thrown into or out of gear, or the action reversed; and, by a very simple contrivance, the Machine is adjusted to suit every description of crop. Agriculturists should order early, to prevent disappointment.—Address,
RICHMOND AND CHANDLER, IMPLEMENT WORKS,
Salford, Manchester, and 32, South John Street, Liverpool.

MAKE YOUR HAY WHILST THE SUN SHINES.
HAY-MAKING MACHINES & HORSE RAKES, on the most improved and approved principles, are now ready for the approaching season at
RICHMOND, CHANDLER, AND NORTON'S
AGRICULTURAL IMPLEMENT DEPOT, 32, South John St., Liverpool.
N.B.—A Two-roomed Galvanised Iron HOUSE, lined, celled, and floored with Wood, to be SOLD very cheap.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

THE THIRD CHELTENHAM SUMMER POULTRY SHOW will take place at that magnificent establishment PITTVILLE SPA, on the 14th and 15th of June. For Prize Lists and full particulars enclose a stamped directed envelope to JESSOP BROTHERS, Secretaries.

The Agricultural Gazette.

SATURDAY, MAY 20, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	May	24—Agricultural Society of England
THURSDAY	—	25—Agricultural Imp. Society of Ireland
THURSDAY,	June	1—Agricultural Imp. Society of Ireland.

A SATISFACTORY illustration of the influence of a dry soil on the temperature of the air has been communicated to us in connection with the history of improvements which are being effected on an estate in Hertfordshire. The farm referred to occupies the highest ground in that neighbourhood, and would have continued to be, what it hitherto has been, one of the coldest spots in the district; but, says our correspondent—"We felt the benefit of being drained this season—our thermometer indicating 6 or 8, and, in some instances, 10 degrees more heat than those of our neighbours; and this is one of the effects of draining which is often overlooked." It may be overlooked and neglected by those who write on such subjects, but plants record it visibly and faithfully enough in the more vigorous and more early growth which they manifest under its influence.

Life is more sensitive to the influence of temperature than any other of the forces which animate matter, and thus indications of an altered climate are to be seen more immediately and readily in the appearance of the vegetable world, and in the dates of the several successive facts which constitute the progress of the seasons, than in the observed expansion of so much mercury or spirit within the bulb and tube of a thermometer.

The report, just presented, of the British Meteorological Society takes notice of this fact in order to request from the members, in addition to the more usual meteorological observations, "full particulars relating to the leafing, budding, and flowering of hardy plants, forest trees, &c.; also the time of Wheat or grain generally first appearing in flower, when in ear, time of commencement of harvest operations and their completion; arrival and departure of migratory birds," &c.

The increasing earliness of maturity which a series of observations of this kind will, we have no doubt, indicate in the vegetable world, is to be understood as having an agricultural cause, originating not in the permanent change of any of those more general formers of climate which it is the province of meteorology to investigate, but in that improved drainage and cultivation which accelerate the growth and maturity of our crops.

THE successful getting in of Mangolds, Swedes, &c., amid thunder-showers is one of the nicest operations the farmer puts his hand to, as many an example has doubtless lately proved. On some porous soils no sooner is the storm over than the sowing machine may be started. Indeed on such lands that is the time for sowing, and for rolling in the "sap" so as to secure a crop. In years of extreme drought a braird cannot be got on them unless the spring sap is retained, and this in our southern provinces is hardly possible—hence the value of the liquid manure drill, or the hose and jet, prior to drilling. To obtain healthy plants is a most important point, for they soon establish themselves, from the great depth to which they send their fibrous roots.

The majority of soils, however, even of this class, are more or less adhesive, and cannot be sown immediately after a thunder-storm, considerable skill being then required to avoid harm. If the ground is ridged up and ready for sowing when the storm commences, then the shower may fall faster, as it generally does, than the drills can imbibe it; so that the greater portion is lost between them, especially in close subsoils, flowing in streams to the headlands, while the seed bed is left comparatively dry. A greater quantity of rain may not have fallen than is required to moisten the drill properly, and of this two-thirds may be lost, and before the machine can be started the little absorbed is again evaporated. Under such circumstances, plants come up late and weakly, yielding probably at the rate of several tons less weight per acre than rows on either side in which the drills may have been rolled flat on the top, or where ground had not been ridged up.

If the drills have been opened for farm-yard manure, the facts of the case will be of a somewhat different nature. If the manure has not been applied, it cannot successfully be so now until the land has attained to a uniform state of dryness, otherwise the surface poaches, and will bake in the first drought. If the manure is spread and ready for covering, there will be less danger of poaching; but ploughing in cold thunder-showers, such as have been experienced in some districts lately, seldom does well.

Clay soils present a different variety of circumstances, for they are not only liable to poach in a greater degree, and suffer injury from cold, but also to concrete, as it were, into a solid mass, in which nothing will vegetate.

Thorough draining, subsoiling, scarifying, &c., under ordinary circumstances as to weather, will reduce the most tenacious clays, so that root crops can now be grown with artificial manures. The surface is reduced to a sufficiently fine mould by the winter frosts; and if the subsoil is properly wrought between the wet and dry, so can it also; but this latter, including the getting in of the seed and manure, requires the greatest circumspection; for, if the farmer but ventures upon the soil immediately after a thunder-shower, the portion below every foot-print is consolidated as if moulded for the brick-kiln. If, however, it is allowed to remain loose and open until a uniform state of dryness has been obtained, the work may be prosecuted with a better chance of success. When soils of this class are reduced to a mould by ploughing, harrowing, and rolling, it is hardly possible to prevent them running together after very heavy thunder-showers, and the finer the mould the more certain the result. The difficulty of growing root crops on such soils, and the general practice of summer fallowing, arises more out of this liability, after this reduction to a mould, than out of the difficulty of attaining so fine a tilth in the beginning.

Of each of these cases the present season has already furnished numerous illustrations. The sowing of root crops is generally accompanied either with thunder-showers or extreme drought; and although the former is not the best condition of things for the farmer, yet it has its advantages when compared with the latter, especially on the first class of soils; and even on clay soils we have seen that their concretion and the other evils involved may be greatly ameliorated, if not wholly arrested, by drainage and improved management. *B.*

THE reports on the STATISTICS OF NORFOLK and HAMPSHIRE AGRICULTURE have just been presented to Parliament. The forms prepared and used by Mr. HALL MAXWELL for the counties of Sutherland, Roxburgh, and Haddington, have been used for the English counties also, so that the results admit of comparison in detail. The methods employed were different, but the difference in the gross results, *i. e.* as to their completeness and trustworthiness, must be held to indicate rather the character of the occupiers than that of the methods of enumeration and calculation employed in England and Scotland respectively. Probably both points have had some influence—the former inquiry coming direct from a Government department was less likely to command confidence than the latter, which was con-

ducted by the Highland and Agricultural Society. And when the indications which the relative success of the two portions of the inquiry affords as to the character of the tenant-farmers in the two districts are spoken of, this must certainly be taken into account. This "character," too, is not the professional standing of the men—it relates rather to individual suspiciousness, and probably selfishness. We have heard men, known for general intelligence and professional skill, justify a refusal of the information sought, on the ground that the Government which sought it, as it had done no good to the farmer on past occasions, could mean no good to him on this—on the ground that deputations on the subject to the Minister, of London merchants, *Times'* commissioners, and corn merchants, must represent an interest altogether antagonistic to that of agriculture (!)—on the ground that the inquiry was inquisitorial, a mere meddling with private and personal affairs. All this, it would seem, may be held without interfering with professional character as agriculturists, and the 17 per cent. of blank schedules returned to the Norfolk enumerators, may have passed through the hands of those who stand high among the many good farmers of that county for aught we know—though we do not suppose it probable; but whether the professional standing of the Norfolk agriculturists be affected by it or not, we cannot but think those of Haddington, for instance, will feel that they stand higher in the estimation of intelligent men, for the fuller, franker, heartier response which they have made to the inquiries which they have received. The number of unfilled schedules in Hampshire amounts to 21 per cent. of those issued. It is satisfactory to learn that of these blank schedules, nearly all were filled by the enumerators themselves, from other trustworthy sources; so that 2¾ per cent. in Norfolk, and 3¼ per cent. in Hampshire, alone remain unfilled. It is proper, too, to add, that in Norfolk by far the most frequent instances of refusal occur in three unions out of the 19 within the county. In 16 of the unions, more than 10,000 occupiers of nearly a million acres filled the schedules that were sent them, 1163 refusing to do so, all the blank schedules in these cases being filled from other sources. In the Depwade, Downham, and Thetford unions, however, comprising 245,000 acres, and 3500 occupiers, upwards of 1400 were returned unfilled, and of these 400 remain unfilled still. In Hampshire, the default is less irregularly spread, if we except the case of the Isle of Wight, with its 1088 occupiers, of whom no fewer than 424 are recusants. We observe also, by the way, that the Alresford union, to which Lord ASHBURTON addressed his well-known letter on the subject, is remarkable for its refusal. It contains 235 occupiers, and of these only 59 have co-operated, the particulars regarding 176 being obtained by the enumerators from other sources.

We add the totals of Norfolk and Hampshire, omitting fractions, placing those of the three Scottish counties alongside, in order to facilitate comparison.

* Turnip seed in Scotland.

We can at present only remark on the fitness of the term Norfolk rotation to the four-years succession of crops, as strikingly brought out by the returns from that county. We may also refer to the great extent comparatively in Mangold Wurzel in that county. Several other points must remain for discussion hereafter.

WE are glad to see from the annual election meeting of the Royal Agricultural Improvement Society of Ireland, just held and shortly reported in last week's paper, that in every department the society is rapidly recovering in its resources and usefulness. Within the last two and a half years the subscribers have been increased nearly threefold; and a spirit has been awakened among the agriculturists of Ireland by means chiefly of the Society's Journal, edited by the secretary, Mr. HARKNESS, aided by the monthly discussions. A spirit of a most enterprising and promising nature is wide spread in Ireland, which, with the physical advantages of soil, climate, &c., must soon elevate Ireland to a first-class agricultural position.

VISIT TO TIPTREE HALL.

IT having been represented to Mr. Mechi that a party of farmers, and gentlemen connected with agriculture in Hampshire, were desirous of seeing his farming operations at Tiptree Hall, they in consequence received a very kind invitation from Mr. Mechi to go and view the system of management adopted there. The writer was induced to make one of the party, in order that he might be able to judge for himself of the practical value of the system of agriculture carried out upon this farm, very contradictory statements having been published for some years past respecting the land and its management, which reports have certainly made Tiptree Hall notorious in the agricultural world. After having seen general commendations and approval of Mr. Mechi's farming on the one hand, and sweeping condemnation or censure on the other, I felt a strong desire to inform myself as to the merits of many points in connection with the practice there, and also to ascertain how far the farming of Hampshire may be improved by the aid of some of the novel and original appliances in operation there. It may be thought by some parties that any further report of this farm would be superfluous; but, judging from what I have previously read about Mr. Mechi's farming, extreme opinions have been expressed, without in some instances giving satisfactory reasons for their expression.

In taking up the pen upon this subject, it is my intention to endeavour to offer a fair and impartial statement of the many and interesting practices noticed at this farm; and, as I visited it not for self-instruction only, I shall therefore give a statement of what I saw, with a view of benefiting, if possible, the agricultural community, and exhibiting in plain terms what I consider may be adopted as sound practice; and, at the same time, to point out that which I think ought to be viewed with caution, and considered speculative and uncertain. I feel certain that Mr. Mechi himself will appreciate my motives, and therefore proceed with much pleasure to the task before me. I must first observe that upon our arrival at the farm we were met by Mr. Mechi, and treated most courteously and hospitably; we then proceeded to view the crops, buildings, &c., headed by our host, who, with the greatest alacrity and kindness, explained the different modes of culture adopted for each crop. The first object that attracted my attention near the homestead was a pond, or reservoir for water, used in the process of liquid manuring, and supplied from the drainage of a large field, a considerable area of which had been originally bog or quicksands.

The first field inspected near the house was a large one, part of which was in Wheat, drilled, and it certainly looked strong and promising, being however too thin of plant in some parts; the furrows also were deep and bare throughout the field, the outside rows being 18 inches apart, and the ridges only 7 feet in width, thus leaving a very considerable blank. I found one part of this field under Italian Rye-grass, being a second year's layer—it having been fed or cut several times during the previous year; a large portion of this crop has been already folded off with sheep, which were still upon it, and, judging from the stubble where fed, and the portion yet remaining, there has been a most abundant crop—the Grass being, on the day I saw it (May 2), upwards of 18 inches in height, very strong and thick, affording a most nutritious food for the hoggets, which were of the half-bred Down and Leicester cross, then feeding on it.

This crop certainly demonstrates, in a season like the past, the great advantage of the application of liquid manure to Grass crops upon arable land; for although I had recently seen crops of this variety of Grass growing upon good land under superior management in Hampshire, and where all circumstances were favourable to its growth (the climate in particular), yet this crop at Tiptree Hall was immeasurably before anything I had seen during the present season; and, I must confess, that I am quite convinced of the efficacy of liquid manure for this crop, believing as I do that no amount or sort of manure applied in a dry state as a top-dressing, upon this land, would have produced the like results. The liquid manure was being distributed by the hose over that portion of the land where the crop had been fed off, and it was very interesting to see the great power of dispersion, and the distance to which the liquid could be thrown by the steam pressure applied to it, although the work going on was a long distance from the huge tank where the manure is manufactured or retained until required for use.

A considerable portion of the same field was sown with Barley, which had evidently vegetated evenly, but had suffered rather severely from the wire worm, leaving some doubt in my mind whether the plant would recover sufficiently to produce a full crop; and I remarked in passing over this crop that the land had been somewhat imperfectly tilled, the furrow had not been sufficiently broken by the harrows, nor had the land been cross-harrowed or rolled enough to obtain the necessary pulverisation and firmness. In one part of this crop a marked difference was to be seen, and, upon inquiry, I found that on the portion on which the crop looked healthy and strong, the previous Turnips had been eaten upon the land by sheep, and that the Turnip crop had been removed from that part which had an indifferent appearance. This fact I must say raised ideas in my mind as to the general advantages of consuming the Turnip crop upon the land; and in connection with the management of this farm I intend to allude to it hereafter.

The next field which came to view exhibited a splendid crop of Italian Rye-grass in the first year of its growth, full 2 feet in height, very thick, the flag very broad, and of a dark green colour. It is difficult to conceive how this crop could be surpassed upon any soil, and under any treatment, if we recollect the date at which it was viewed, and it must indeed be considered a triumph in vegetable production through the agency of liquid manure. Some little objection, however, may be taken to the mode of disposing of this crop; bullocks and horses were feeding upon it, a portion being partitioned off daily, and I thought it would have been better if the Grass had been cut and given in racks, or else carried to the homestalls for soiling. There would have been less waste, and a close shaven stubble will always prove best for the succession, and it is an important point that nothing may impede the progress of the succeeding crop, where, by the liquid application, it is sure to come so quickly and in such abundance.

The next field noticed was in fallow, and in a forward state of tillage for the next root crop.

We now passed into a piece of six acres, the only pasture upon the farm, which had been laid down about eight years; and it was stated that much difficulty had arisen before a good turf could be obtained, but that the application of liquid manure had given it the appearance under which I saw it; the land had certainly a good bite of Grass upon it, and some natural Grasses I noticed looking strong—the Yarrow in particular bearing evidence that this soil is naturally suited for pasture. I found on inquiry that this piece of land was originally seeded in a corn crop, the advantages of which practice I doubt, for I have noticed that the best Grasses peculiar to the soil will come naturally several years earlier when the land is seeded down out of fallow in the summer season. *J. B.*

(To be continued.)

NOTES OF A RECENT AGRICULTURAL TOUR IN IRELAND. By MARTIN DOYLE.

KILMALLOCK.—This is in the county of Limerick, and within 16 miles of the city. It would be a fine agricultural district, if managed in the English style. The vestiges of former grandeur remain in the ruins of castellated mansions, military strongholds, a Dominican monastery, and other ecclesiastical antiquities. A modern poor-house contrasts, yet not inappropriately, with the traces of the religious houses which formerly fed the hungry and the naked. When will the poor cease in the land? That the number of inmates of poor-houses is diminishing rapidly is certain, and a legitimate subject of congratulation; but that the condition of the rural labourers is much amended is very questionable, and this is one of the most surprising of the numerous anomalies which characterise Irish proceedings. The poor peasantry have been emigrating in shoals, and yet the wages of labour have not increased.* In the counties of Tipperary and Cork, for example, 8*d.* a day is the ordinary price of a man's daily work; the same pittance is his payment in Connaught. Though the average annual amount of emigration from Ireland during the last three years has been 250,000, yet no perceptible rise in wages has been the result, generally speaking. Two or three principal causes seem to have occasioned this:—

1. The great redundancy of labour in the market, relatively with the degree of actual employment, has not been even yet sufficiently reduced in the over-populous districts to cause any sensible difficulty among the employing classes in providing the necessary supply of labour.

2. The employing classes have been hitherto unable to pay for labour, under the depressing influences of poor-rates, &c., with little rent received to meet such demands, and debts almost necessarily accumulated under the late and long-continued calamitous condition of the country.

3. The consolidation of small farms on their surrender by the occupiers, and the tendency to convert arable into pasture land, from various and obvious influential agencies. Therefore, unless where a railroad is to be formed, or some great work, public or private, is to be executed, the demand for labourers is inconsiderable, and as yet easily supplied. But this state of things cannot continue; the home labour will be rapidly absorbed in the market, and even the orphan boys and girls of the union-houses will be objects of demand before long, in consequence of the unabated and perhaps increasing emigration to the States of America of the able-bodied labourers with their families. The short state-

* It is to be recollected that this tour was made in April and May last year.

ment of a single case within my own knowledge will tend to prove the high degree in which an Irish labourer's condition may be improved by emigration; and this admitted, it follows that a shrewd people are likely to benefit themselves still more extensively by such evidences, which are of constant recurrence. One of my friends had for many years an active, intelligent labourer, who, having an unthrifty and rather sickly wife, and some children, was always in debt and difficulties. He had 10*d.* a day and a cabin rent free. Deducting holidays and other interruptions to labour, his own yearly earnings could not have exceeded 12*l.* 10*s.*, and the profits on a pig, with the wages of a few weeks' labour by his wife in harvest, might have added 3*l.* more to this sum. His employer, finding him and his family a dead weight on him, lent him money sufficient to defray his passage to New York about two years ago, and allowed his wife and children to remain in their cabin, and struggle on as they best might, in the absence of any poor-rate allowance in Ireland to extern paupers. When I was with my friend I saw this poor woman, condoled with her on the little probability of her ever seeing her husband again, and advised her to go into the union house, as the last resource for the destitute. I had scarcely left the place when a letter from her unexpectedly faithful husband arrived to my friend, with a draft for 17*l.* 10*s.*, to pay the expenses of the transatlantic voyage for his family, and the amount of the money he had borrowed. This man had no doubt been well fed, well clothed, and well housed during his two years of labour in America, and has probably remitted only a portion of the capital he has already realised by his industry. It is notorious that a vast amount of money is arriving weekly in Ireland for similar purposes. If he had been in the enjoyment of decent comforts in Ireland he would not have emigrated; the love of country is keenly felt by the Irishman, even in his most isolated condition; the mere thirst of gold would not send him forth; but Providence, no doubt with wise and beneficent designs, is now rendering his semi-starvation, and flight from it, the foundation of much prospective good both to those who depart and those who remain to profit by the vacancies and opportunities that are and will be increasingly afforded to them.

Much apprehension is entertained by persons very competent to form an opinion on the subject, that the number of land cultivators is alarmingly diminishing through the process of emigration. Shortly before my arrival in Dublin, Doctor Ellis read an able and interesting paper before a section of the Royal Dublin Society on this subject. He has considered it in two principal aspects. First, the causes of the emigration. The famine and flight from starvation were of course the primary motives. He considers that if anything like the comforts and necessaries of life had remained within the poor Irishman's reach, he would not have left the land which he has so much loved; and even now it is not the pursuit of gold, as it is influencing the people of other countries, which carries such multitudes away—it is the desire of rejoining the relatives who are gone. This, no doubt, is a strong motive with the warm-hearted Irishman; but I may fairly ask, would he follow his people to the New World, or elsewhere, if there were not very decisive testimony that the preceding emigrants find comparative wealth and happiness there? and is it not desirable that these poor people should better their condition by the continued exodus? Dr. Ellis lays great stress upon another primary cause (arising no doubt from their experiences and disappointed hopes), which is very likely to be highly impulsive, viz., "want of confidence in the sufficiency of the soil to yield rent and support as long as the growth of the Potato crop continues to be precarious."

The counteracting influences which this gentleman would excite to revive confidence in the capabilities of the soil, are to show the small holder that by rearing animals for the market, in humble imitation of the landowners who are raising live stock as much as possible on the lands which they are taking into their own possession, instead of cultivating the precarious Potato, they may prosper. He would still have small farms as ameans of arresting the tide of emigration, and encourage the rearing of pigs and poultry at least, and the culture of such feeding materials as are suitable. Among these he places cattle Beet foremost. Turnips will keep pigs alive, but Mangold Wurzel fattens them, especially when mixed with a little meal or corn. This I have seen practised with great effect on the small farms of some Irish amateur cultivators, one of whom has a steam apparatus for the purpose of reducing the Beet to a pulp. But will the Irish peasant give up the culture of the Potato while there is a chance of success? Successful experience of the other system, just noticed, might induce him to do so. An intelligent man, says Dr. Ellis, arrived at the conclusion that "the quantity of Indian meal and other wholesome food which he could purchase by the sale of pigs fed from half an acre (? Irish) of Mangold Wurzel, would go farther in the support of his family than the quantity of Potatoes he could raise from the same extent of land even in the best seasons."

The Mangold Wurzel keeps well until July. Flax and Sugar Beet will also become staple products of the small holder's land. A system of tillage by which various feeding crops would be raised is, in the rational judgment of Dr. Ellis, far better than any exclusive system, as the chances of success from different kinds of produce are more equal; and, as a warning to landowners who would convert large arable tracts into pasturage (on the plea, I suppose, for I am now quoting Mr. Ellis from recollection, of dispensing with human labour, or avoiding the risks of insolvent or dishonest tenants), he refers to the epizootic diseases which in England and Holland have produced, as the disease of the Potato in Ireland, such ruinous consequences—30,000 cattle being destroyed within six months in a single county of England—Cheshire, and 200,000 in Holland. Great mortality among sheep has prevailed in Ireland within a short time. He recommends, then, a system of mixed agriculture, and the encouragement of small farms, but not in minute subdivisions. Yet for pasturage, with such artificial green and root crops for their support as will bear the storms and blights from the Atlantic on the western coast, should be the rule. Corn-growing there, as a part of the system, cannot succeed in such a climate; and fortunately there is not actual necessity for it for the sake of providing cattle-bedding. Heaths, Rushes, dry peat, mould, and seasand will, in many such exposed localities, afford the materials for littering cattle, and thus supply elements for the dung-heap; and the system of which Mr. Huxtable and others have for several years been the advocates and practisers, in substituting open-boarded floors without bedding for sheep and pigs, is a final and effective resource where the mixed system cannot be fully carried out; where grain crops cannot be successfully cultivated. The raising of Turnips, Rape, Cabbages, and Vetches, might be pushed to a vast extent in the ungenial and ruder parts of Ireland, where some spirited Scotsmen and others have already established themselves; but in the milder and properly arable portions, the combined system is certainly the most desirable; and this seems to prevail on the line from Dublin to Skibbereen, which was the extreme southern point of my journey and observation.

LIQUID MANURING.

[The following are the conclusions arrived at by Mr. Home on the subject, after examining sundry farms in which the practice had been carried out.]

In the previous reports, I have endeavoured to abstain from any intimation of my own opinions or impressions, desiring only to communicate such information as I procured when visiting the several farms referred to. It will be for the practical farmers of the club to say, whether the system of husbandry reported on, which so materially differs from anything known in Berwickshire, is one which should be encouraged, or whether it affords any hints for at least modifying our own practice. I shall listen with much interest to the opinions which may be expressed on these points, being assured that there are many present, who, from their experience and intelligence, are far more able than I to judge of the utility of the system which I have been describing. I confess that the impression formed on my own mind from what I saw and heard, during an inspection of the four farms which I have reported on, and from what I have since read of other places where a like system is practised, is favourable to its more general adoption; and but for that impression, I would not have brought the subject before the Club. But it is an impression only, and one which it would neither grieve nor surprise me, if I give up, after hearing the matter fully and fairly discussed at such a meeting as the present. With the view of giving a character of relevancy and precision to our discussion, I may conclude by mentioning the different points which, as it strikes me, are the most material to be considered.

I. On the one hand, account must be taken of the expense of the process, consisting of the wages of the persons employed to manage the distribution, the fuel necessary for working the engine, and the interest on capital. From what has been before stated in regard to Myremill, it appears that though the expense of irrigating by pipes and steam power is estimated by the Board of Health Commissioners at 14*s.* per acre, the amount should not be stated at more than 10*s.* or 12*s.* per acre; a conclusion which is confirmed by the fact that at the farm of Halewood, near Liverpool, containing 350 acres, the working expenses annually amount to 9*s.* 9¾*d.*, and that at Mr. Littledale's farm, near Birkenhead, containing 450 acres, the expense is only 9*s.* 0¾*d.* per acre.

II. The other side of the account, which shows the advantages of the system, may be divided into two heads—one connected with liquid manuring, and the other with stall feeding of sheep.

(1.) Under the first of these heads, account may be taken of the greater economy of transporting manure out to the land. It is shown very clearly in the Board of Health Report that the cost of transmitting liquid manure through pipes and hose is twopence per ton, within a distance of three quarters of a mile. Now what is the cost of conveying a ton of manure by carts and horses? To take it out by a water barrel, would be ruinous. But in the simplest way, which is in the form of farm-yard dung, the cost for half a mile, when filling and spreading are included, cannot be stated at less than sixpence a ton; so that for every ton there is a saving of fourpence by piping. Now it is stated in the Board of Health Report, that "one lot of Swedes (on the farm of Myremill) dressed with 10 tons of solid farm manure, and about 2000 gallons of the liquid having six bushels of dissolved bones along with it, was ready for hoeing 10 or 12 days earlier than another dressed with double the amount of solid manure without the liquid application, and were fully equal to those in a neighbour's field which had received 30 loads of farm-yard dung, together with 3 cwt. guano and 16 bushels of bones per acre. The yield was estimated at 40 tons the Scotch acre." The cost of manuring these Swedes by the pipes was, according to the above data, 6*s.* 6*d.* per acre; and by carts and horses 10*s.* in the one case and 11*s.* 6*d.* in the other—showing a saving therefore of from 3*s.* 6*d.* to 5*s.* per acre on the Turnip break. Had the manuring been heavier, or the transport farther, the economy of piping would have been proportionally greater. Applying these results to the farm of Myremill as an example, it will be remembered that there were this year 157 imperial acres of green crops, on the manuring of which by pipes instead of by carts and horses, there must have been a saving of 35*l.* 6*s.* There were 37 acres of Italian Rye-grass, which after every cutting has between 4000 and 5000 gallons applied to each acre. This is at the rate of 22 tons an acre, and supposing it cut five times, 110 tons per acre would be applied during the season, at a cost of 18*s.*; whereas if that quantity of manure had to be applied in the cheapest way by carts and horses, it would have cost 55*s.* per acre. On these 37 acres therefore a saving of 37*s.* per acre was effected, amounting to 160*l.* 19*s.*

(2). The next item for consideration is the quantity of produce raised. That the produce is greater, both of Grass and of green crops, seems to be scarcely deniable. The cause of this seems to be partly in the greater efficacy of manure when in a liquid form, and partly in the nature of the ingredients composing it. It should be remembered that the tank liquid contains a larger proportion of salts—particularly urea—than farm-yard dung. Of urea, Professor Johnston remarks that, "it is far richer in nitrogen than flesh, blood, or any of those other richly fertilising substances, of which the main efficacy is supposed to depend upon the large proportion of nitrogen they contain." My position is that 10 tons of farm-yard dung, and 10 tons of tank manure, form together a richer compound than 20 tons of farm-yard manure alone. Then there is this other consideration, that the liquid being soluble, the whole of it can at once be appropriated by the roots of plants. Hence there need be no surprise at the facts already referred to, which is stated in the Board of Health Report (p. 69), that 10 tons of farm-yard dung, with 2000 gallons of liquid manure, with 6 bushels of dissolved bones in it per acre, produced as good a crop of Swedes, as 22½ tons of farm-yard dung, with 3 cwt. of guano, and 16 bushels of bones. Without attempting to estimate the excess of the several crops of Turnips, Cabbages, Mangolds, and Carrots at Myremill, over those obtained by the ordinary system of manuring, I will assume that overhead the excess is equivalent to 10 tons per acre of Swedes on the whole green crop break, which at Myremill is 157 acres, and estimating the value of Swedes at 10*s.* per ton, which seems a very moderate price, especially when the nature of some of the crops is considered, the profit under this head will be 785*l.* In regard to the additional produce from the Grass break, my estimate is as follows:—About 40 tons of food per acre are raised, by sowing Italian Rye-grass, cutting and manuring it five or six times during the months of summer and autumn; whereas by raising ordinary Rye-grass and Clover about 16 tons are got—showing an excess therefore of 24 tons per acre, and which at the price of 10*l.* per ton would give 13*l.* per acre. But rom this return must be deducted the cost of cutting and carrying these 24 tons, and of manuring the land after every cutting. The cutting would probably amount to 4*s.* and the carrying to 6*s.* The cost of manuring depends on circumstances. At Enterkine Farm, as we have seen, where milk cows only are kept during the summer, Mr. Bell, to supply the deficiency of liquid manure, gives to each acre 16 cwt. of guano. But a feeding bullock gives a much larger supply of liquid manure—it is believed about 10 gallons daily; so that the seven bullocks which Mr. Kennedy says can be supported on 1 acre of Italian Rye-grass would during six months give altogether 12,600 gallons, which diluted with three waters amount to 50,400 gallons, being equal to what is required for the whole five cuttings in the course of the season. The only expense therefore is sending this liquid through the pipes, which at 2*d.* per ton is 1*l.* 17*s.* 6*d.* This, and the cost of cutting and carrying, amounting altogether to 2*l.* 7*s.* 6*d.*, leave a profit of 10*l.* 12*s.* 6*d.* for every acre of ground cropped with Italian Rye-grass, and yielding on the whole break 924*l.* To these items, there might be added, the larger crops of corn which are said to be raised; but as no precise data were obtained by me for estimating this item, I pass it over. The foregoing calculations are connected with the system of liquid manuring. Those which follow are dependent on the system of feeding sheep on sparred boards, and under cover.

(1.) The saving of manure is one item, which Mr. Kennedy estimates at 2*s.* 6*d.* per sheep, amounting to 57*l.* 10*s.* on 460 sheep. (2.) The additional weight and improved quality of the wool is another. An addition of 2 lbs. to each fleece would probably add to the value of each sheep 2*s.*, amounting to 46*l.* To these should be added, the improved health of the sheep, and their more rapid fattening, especially during the winter and spring months; but I am unable to put a money value on these. Putting together all the other items which I have attempted to estimate—

1. Economy of transporting manure			
For green crops	£35 0 0		
—— Italian Rye-grass	160 19 0		
		195 19	0
2. Additional produce			
From green crops	785 0 0		
—— Italian Rye-grass	924 0 0		
		1709 0	0
3. Sheep stall-fed			
From manure	57 10 0		
—— wool	46 0 0		
		103 10	0
	£2008	9	0

This sum, when divided by the number of acres on the farm, which is under the system referred to, give a return of rather more than 5*l.* to meet the expense of 10*s.* per acre. I owe an apology for even attempting to offer calculations which only a practical farmer can accurately make. I am quite prepared to have errors pointed out in them, as I pretend not to a personal knowledge of the prices and expenses which I have assumed. What is more, I shall feel indebted to the practical members of the club, if they will point out the errors which I have committed, being in this matter most sincerely desirous of expiscating only the truth, and of ascertaining whether the favourable impression I entertain of the system reported on, be or be not founded on sound principles. These calculations I ventured on as at all events the best way of indicating the point which, as it occurs to me, should be chiefly embraced in our discussion, and with the view of drawing out the practical members of the club on grounds which they are so well qualified to occupy. The tenantry cannot do a greater service to proprietors than by correcting their mistakes in such matters; and it is one of the peculiar advantages of such a club as ours, that it affords to both classes an opportunity of discussing in a free and friendly way subjects which are of the utmost interest and importance, not to them only but to the country generally. *Mr. Home's Report to the East Berwick Farmers' Club.*

AGRICULTURAL STATISTICS.

I WOULD suggest, as desirable, returns for each county of the kingdom, given in by farmers themselves to the Board of Trade, printed schedules and envelopes being supplied them, so that they have only to make the necessary extracts from the books (generally figures), insert them in the respective columns, and forward their returns to the London office, under the seal and stamp of the Board. Let this be done as soon as farmers can say with certainty the probable amount of their present crops. Let there be two sets of columns on each schedule, or two schedules, one for the statistics of the present crop (say 1855) by inspection, and the other for the actual statistics of the past crop (1854) after being threshed; and when a farmer forwards his returns to the office of the Board of Trade, let him then sign a declaration in some local office that he had complied with the demands of the statute, which would entitle him to a copy of the returns, when printed by government, *gratis*.

At first sight this double system, as it may be called, may appear superfluous in one sense, and inadequate in another; but a little inquiry into the facts of the case will show the contrary, for the report 1855 is required to enable corn merchants to make the necessary purchases of foreign corn in time, and 1854 to regulate corn averages, and the actual consumption of the country; while the two conjoined would check each other, requiring little more labour, upon the whole, than would the former alone, if not less. The amount of labour would not be more than is now demanded in the case of fiars prices in Scotland, and not one-fourth part of that required by the weekly averages of England, no longer required; while in neither case would it be more inquisitorial or liable to subject tenants to consequences; for the idea of a landlord going to the office of the Board of Trade to inquire after his tenant's statistics, for the purpose of screwing up his rent, is of too fictitious a character to deserve serious attention, as the door could easily be barred against him.

The statistics of old corn on hand are as necessary to be known at the commencement of every season as the produce of harvest, for unless they are so, the consumption and wants of the country cannot be ascertained. If the produce of harvest, for instance, is 5,000,000 qrs. short of that of last year, who can tell from this what the consumption is, or the stock on hand to meet it? for farmers and the corn trade may have 6,000,000 qrs. of old corn on hand more than they had last year. A country dependent upon foreign corn to the extent of 5,000,000 qrs. annually can never be in any great danger of having a stock on hand to this amount, and when we consider the profits realised when a short crop is harvested, as that of last year, it is not unreasonable to suppose that large stocks of this kind will generally be found in our stackyards and granaries after seasons of over-flowing plenty. For aught that can yet be said to the contrary, no more imports may be required, taking this year as an example, than were purchased last year, if so many. Much as has been said of the deficiency of crop in 1853, and the inadequacy of foreign resources to make up the balance, our imports, stackyards, and granaries may yet tell, as they did in 1847, that our dependence upon foreign agriculture is less than generally imagined. In short, the statistics of old corn on hand at the commencement of the season may have been such as would have quieted the public mind, and prevented much extravagant speculation in the markets of Europe and America, as to the prices to be realised in France and England, had they been known in time. In drafting schedules, therefore, provision must be made for collecting the statistics of old corn on hand, and it would be desirable to include the whole *et ceteras* of the home and foreign provision trade also. In other words, the food of man, of beasts, and of plants (manures), form distinct and separate branches of statistical science, yet so dependent upon each other and of so much importance to farmers and the public, that every exertion should be used in the construction of machinery for their immediate collection and control.

I might add many reasons for the double system of collecting statistics proposed, and also point out not a few difficulties in the way of its reduction to practice, until farmers learn to keep accurate books and form correct estimates of growing crops; but our limits will not permit us at present doing so. All that we can say on the present occasion is, statistical science demands facts which farmers, corn-merchants, &c., alone can give, not only in respect to corn averages, but also as to inspection returns of crops prior to being threshed or harvested, for corn fields require to be more closely examined than any other person but the farmer has a right, or even time and opportunity to do. Potatoes and Carrots, again, require to be dug up, while dairies, poultry-yards, piggeries and gardens, require daily examination, as also the consumption of corn and other produce by live stock before the most distant approximations can be obtained. Even were it possible for the most intelligent valuations to do so, what would be the value of their returns to corn merchants; for unless they had the actual returns of the previous crops, in order to enable them to judge what the consumption had been under certain circumstances, what the quantities farmers sold compared to what they grew, and what the difference between facts and opinions, or between inspection and actual returns determined by the balance and bushel, they could not arrive at satisfactory conclusions; and it is manifest, therefore, that farmers and the public must submit to a little schooling in accordance with the familiar old maxim of paying "an apprentice fee," and the sooner they begin the sooner they will finish their apprenticeships. *B.*

ON SOWING MACHINES.

IT is undoubtedly of great importance that the land be prepared for the seed in the most efficient manner—that, by the use of other machines, it be cleaned, tilled, and left in the state in which it shall be most economical of its own resources, and most active in appropriating those which atmospheric influences offer to its use; but it must not be forgotten that it is only as it is thus made an efficient nurse and mother of the growing plant, that the valuable qualities it has thus acquired are of any use to man. In order, therefore, that these qualities may best be utilised, the seed which is to benefit by them must be placed in the most fitting circumstances with reference to them. All the previous labours of the farmer go for nothing if the seed be not properly sown; and thus the necessity of efficient sowing machines obviously becomes greater, the greater the skill and the cost which have been spent upon the previous tillage of the land. Hence it will probably be found that no class of implements has been more abundantly multiplied in the land within the last few years. Mr. Smyth, who, contemporaneously with the late Mr. R. Garrett, was the original maker of the Suffolk drill, now has competitors in every county in the kingdom; and, while the extent of his own manufacture and sale in this particular class of implements is no doubt many times what but few years ago it was, we are told that that of Messrs. Garrett & Son amounts to nearly 10 a week. On a first consideration, it certainly appears that the ultimate position of the plants in the field ought to be equidistant—thus giving to each equal shares in soil, air, sunshine, &c.—and that they ought to be placed at such intervals that the number of plants in connection with the produce of each shall yield a maximum per acre. This is obviously enough correct in theory, and the determination for each class of circumstances, whether of soil or climate, of the exact distance for each kind of plant, at which neighbourhood shall, by increasing the number of plants, best compensate for the diminished produce per plant which it also occasions; at which, in short, this produce per plant, multiplied by the number of plants per acre, shall be a maximum, is a point of very great agricultural importance. But a theory which puts out of regard some of the most obvious facts in the farmer's experience, cannot lead to correct agricultural practice. Were the soil, the air, and the seeds of the wished-for crop the only matters claiming attention, the equidistant plan would be correct; unfortunately, however, seeds of many kinds exist self-sown in the soil, and these spring up, and, if allowed, will compete with the cultivated plants, to the great detriment of the latter; and thus it is that, in practice, and in order to facilitate the destruction of the natural produce of the soil, we generally modify this equidistance of the plants; so that, instead of each being in the centre of its own little square, they shall grow in lines, nearer to one another in those lines, but farther from one another across them; and thus, while their number per acre remains unaltered, the interlinear spaces give opportunity for the use of fallow implements, by which the land may be tilled and cleaned during the growth of the crop.

But the position of the seed *on* the soil is not the only point requiring attention; its position *in* the soil is of equal importance. If by broadcasting seed, which is still a common practice in the case of Grass seeds, Clover, and even the Cereal Grasses, we could insure a perfect equidistance of the individual seeds upon the surface, that would still be an imperfect result, not only because absolute equidistance in a weedy soil is not desirable, but also, and far more, because no method would then present itself of insuring the uniform covering of the seed. In practice, the farmer sows an additional bushel or more of Wheat, and even more of other grains per acre, when he sows it broadcast, than when he sows in rows, for he knows that the use of the harrow is a very imperfect plan of covering the seed—some seeds being thus buried too deeply, some not deep enough, and a good deal not at all; and for the additional risks it thus undergoes, a large margin has to be provided in the sowing.

An uneven sower should be provided with more seed than a good one will need, because the latter will, at all events, insure over the whole surface a tolerably equable distribution of seed; while the former, wasting his allowance in some places, will need an extra quantity for those which otherwise would not have their proper share; and a machine for sowing broadcast will require less than either, because it will scatter perfectly; but those machines, which not only place their seed upon the surface, but at the required depth beneath it, will evidently require less still, for with them uniformity in all respects is insured, and no waste by unevenness, and therefore occasional excess, either in surface distribution or in distribution through the depth, is incurred. Dibbling machines and drills are thus the most efficient and economical of our sowing machines. Their cost is, no doubt, considerable, but the saving of seed effected by them, and still more the vigorous growth of the seed they deposit with such uniformity, is more than a sufficient return for the investment.

In every sowing machine two contrivances are required, the one for taking successive equal portions, or a uniformly continuous portion from the store of seed; and the other, for distributing it evenly over the surface, or placing it properly beneath it. In ordinary sowing by hand, the first of these requirements is answered by the right hand, which, keeping time with the right foot, finds its way regularly to the seed bag hung at the left side of the sower; and the second is also answered by the practised skill of the sower, when, keeping time with the left foot, having cast back his right arm till it is at least square with the line of his progress, he regulates the opening of the hand, and the direction and force of its forward cast, so as to insure the even distribution of its contents over a space equal in one direction to two of his own paces, and in another (supposing him to go up one side of a perch-wide land and down the other), in effect to some two or three yards of breadth. The uniformity of all these movements, in reference to the time spent on them, is immaterial, provided it be preserved in relation to the space traversed during their performance; the sower may go fast or slow, but if, whatever the speed, his paces be of uniform length, and the other parts of the process be skilfully performed, the result will be the even distribution of the seed over the surface.

Now, just as every motion of the arm is made to depend on that of the leg of the sower, while the latter can easily be preserved uniform by a very little practical skill, so, in sowing machines, every step in the process of delivery, whatever its plan may be, is made dependent on the revolutions of the driving-wheel; and as these are necessarily of equal length as regards the space passed over, the uniform delivery of the seed in relation to space is preserved, whatever be the rate of motion at which the machine is driven. This, indeed, is not absolutely true in some of the modes of delivery which are adopted, because their efficiency is in some degree dependent on the rate of movement; but it is in practice true of such variations of rate as are likely to occur in the field, and it may be considered absolutely true in the case of the better methods of delivery.

I will [next week] describe some of the principal methods of delivery adopted, and then consider the various contrivances which have been devised for conducting the seed to its resting place, going over incidentally such illustrations of both as our different sowing machines afford. *J. C. M., in Blackie's Cyclopedia of Agriculture.*

AGRICULTURAL CHEMISTRY.

SESSIONAL EXAMINATION—ROYAL AGRICULTURAL COLLEGE.

[WE publish in a somewhat condensed form the replies of Mr. J. M. Davis to the following questions:—]

2. State the reasons why a mechanical and mineralogical examination of a soil is attended with greater practically useful results than a minute chemical analysis of a soil.

3. What is the reason that some marls possess much greater fertilising properties than others?

4. Give a short account of Professor Way's recent discoveries relating to the power of soils of absorbing manuring substances, and illustrate by some examples the practical tendency of this discovery.

5. From whence is the nitrogen in plants derived?

6. Is the proportion of nitrogen in the various feeding stuffs a sufficiently trustworthy guide for estimating their respective feeding values?

7. What are the advantages of preparing home manure in boxes?

8. What are the effects of nitrate of soda on plants, and to what crops and in what way is it most beneficially applied?

9. How do you ascertain the strength and commercial value of gas-liquor?

2. A mechanical and mineralogical examination of a soil is of much greater practical value than a minute chemical analysis, because it gives you the state of division of a soil, and the nature of the rock from whic

such soil was formed, which is of great utility; thus, on a soil formed from the decomposition of felspar, &c., certain manures would be unnecessary—their application would be an unnecessary expense, because the same purpose would be better effected by exposing the soil as much as possible to the action of the atmosphere, by means of which the felspar would get decomposed, and decomposition would furnish to the soil soluble alkalies. It is well known that the fertility of a soil is dependent upon the amount of potash, ammonia, and phosphoric acid, which it contains; hence, in analysing a soil, our object is to find out the relative quantities in which these constituents exist in the soil; this we attempt to do by chemical analysis, but it is not done in reality, as the limits of variation in the determination of those substances is greater than the whole amount present in the soil. Again, chemical analysis does not tell us the state in which substances exist in the soil—whether they are in a soluble or an insoluble form, &c.; hence, the utility of chemical analysis of a soil is not of so much importance as is generally given to it. But it has its advantages, as well as its disadvantages; thus, it enables you to recognise the presence of an excess of any poisonous substances in the soil, such as sulphate of iron, or an excess of common salt, &c., and also whether there is a superabundance of humus substances (organic matters) present in the soil, thereby showing whether the soil requires liming. It will also tell you whether a clay soil would be benefited by thorough burning, as this is dependent upon the silicate in the clay, many clays not containing much silicates of the alkalies would not be benefited by burning; whereas, others, in which they existed in an insoluble state in abundance, would well repay for burning, as by means of it the alkaline salts would be liberated in a soluble form.

3. Some marls possess much greater fertilising effects than others, because they contain more phosphoric acid; and also some red marls contain a good deal of silicate of potash, and the fertilising effects of marls is greater or less, according to the amount of the above constituent which they contain.

4. Professor Way was led to his discovery relating to the descriptive powers of soil by some observations made by Mr. Huxtable, and also by Mr. Thompson, who remarked that when liquid manure was passed through a soil, that it was deprived of its colour, smell, and also of its fertilising constituents. Prof. Way then inquired into this absorption, and to what substance it could be due; he thought that it might be due to the organic matters in the soil, or to the carbonate of lime in the soil, or to the clay itself, &c.; however he proved that it was not due to the organic matters, or to the carbonate of lime, but to the clay itself, or to some compounds contained in it; he also found that when he passed through a soil a solution of chloride of ammonium, that the ammonia was retained, and that the chlorine passed in solution in combination with another base, generally lime, being most frequently present in the soil. He also found that the same change was effected by merely shaking the soil with the solution of chloride of ammonium, or with a solution of caustic ammonia. He then traced this absorption to the double silicates in the soil; this he proved by preparing artificially, without the aid of heat, double silicates from felspar, by adding to a solution of this double silicate a solution of soda. By these means he obtained a double silicate of alumina and soda; and on passing a solution of caustic ammonia, or of some salt of ammonia, through a soil containing the silicate of soda, he found that the salt was decomposed—the ammonia displacing the soda and combining with the silicate of alumina, to form a double silicate of alumina and ammonia; and the soda in combination with the acid of the ammonia salt passed in solution. He also prepared other double silicates artificially, and found the same effect produced. Having tried a series of experiments, he discovered that there was a certain order in which these substances replaced each other; thus, silicate of soda, being the weakest, is displaced from its combination if lime is passed through a soil containing it. Again, a silicate of lime would be decomposed by potash, *i. e.*, the potash would displace the lime and enter in combination itself; and ammonia had the same effect on potash. Hence if placed in the order in which they would displace each other, putting the weakest first, it would be as follows:—Soda, lime, potash, ammonia. Lime will displace soda, potash will displace lime, and ammonia will displace potash. The practical tendency of this discovery is to prove that a farmer need not be particular as to the time he applies his manure to the land, provided his land is a clay and contains these double silicates; that winter manuring may be pursued with advantage, and without fear of any waste of manure; and that a system of irrigation is beneficial even to heavy land, if it is well drained, as the alkaline salts, &c., held in solution by the water would, in passing through the soil, be retained by the double silicates existing in such soils.

5. The nitrogen in plants may be derived from several sources, viz., from—

(1). The ammonia as well as free nitrogen in the atmosphere.

(2). The free ammonia, and also the ammonia obtained in decomposition of the organic matters in the soil.

(3). The nitrogen in manures.

(4.) The nitrogen in the seed.

There have been great disputes as to the sources of nitrogen in plants; with one view we find Liebig, and with another, Mulder, and with a third, old agriculturists and vegetable physiologists. Liebig says that the whole of the nitrogen in plants is drawn from the ammonia in the atmosphere, and he denies the use of ammonia manure in the soil. Mulder, taking a more moderate view, does not deny the use of the ammonia in the atmosphere, but he is also of opinion that the organic matters in the soil and the ammoniacal manures are also of great utility in furnishing plants with nitrogen. The organic matters are also of use, because in decomposition hydrogen is given off, which in a nascent state combines with the free nitrogen of the atmosphere to form ammonia, so that the free nitrogen in the atmosphere is a source of it in plants. Old agriculturists and vegetable physiologists were of opinion that the whole of the nitrogen in plants was derived from the ammonia in the soil, manures, &c. Of the various opinions as to the nitrogen theories, that entertained by Mulder seems to be most consistent with practical experience. Yet the views of Liebig are correct as regards certain classes of plants, as Mr. Lawes of Rothamsted has proved by his experiments that the cereals and Grasses only are benefited by the ammonia in the manures, and that leguminous plants, Peas, Beans, Clover, &c., are not benefited by the ammonia in manures, but that they derive it nearly altogether from the atmosphere; so that both views are correct, but with regard to different classes of plants.

6. The proportion of nitrogen in the various feeding stuffs is a guide as to their values only to a certain extent. It has been supposed that the richer in nitrogen any food was, the greater would be its feeding effects, but this has lately been shown to be a fallacy. The results of experiments made by Mr. Lawes at Rothamstead, and also by Dr. Voelcker, on the Royal Agricultural Society's farm last year, go far to prove that the value of food is not dependent upon the amount of nitrogen it contains, but upon the amount of carbonaceous matter it contains. And after a certain stage of the growth of an animal, it does not require much nitrogenised food, but merely enough to keep up the animal system; and if any more nitrogen than is sufficient for that purpose is taken into the system, it is rejected and carried off in the manure; therefore, much nitrogen in food does more harm than good, as it has to be rejected at the expense of the system. The carbonaceous food is by far the most valuable for feeding, as shown in the effect produced by oilcakes in feeding, and, no doubt, the value of a food for feeding is more dependent upon the amount of carbonaceous matter which it contains, than upon the amount of nitrogen. In Turnips, for example, the leaves contain more nitrogen than the roots, and yet they are not so good for feeding. However, the amount of nitrogen present in the form of albuminous compounds is, to a certain extent, a guide as to the value of the food, because it is the most expensive article in the food.

7. The advantages of preparing home-made manure in boxes are, 1st, That all the liquid manure is preserved—it is taken up by the straw of the litter and thus retained; 2d, That the manure is prevented from entering into fermentation by the continual soaking with liquid from the beast. And in boxes the liquid is preserved without losing any of its fertilising constituents; and as it is the most valuable portion of a manure, its relation in the manure very greatly increases the value of that manure.

8. The effects of nitrate of soda on plants seems to be chiefly in furnishing the plants with nitrogen in the form of nitric acid; it is most beneficially applied as a top-dressing for young Wheat, and also on Grass land, on both of which it has very stimulating action.

9. The strength and the commercial value of gas liquor are dependent on the amount of carbonate of ammonia which it contains. To ascertain this, take a quart or more of gas liquor, add to it hydrochloric acid, and evaporate on a water bath to dryness, and weigh as chloride of ammonia, and from this calculate the quantity of ammonia.

10. Oily or fatty matters not only have no fertilising effect as manure, but they have a decidedly injurious action, as they retard the decomposition of animal and vegetable matters in the soil, and do not themselves decompose for a long time; even if they did not retard the decomposition of sulsates in the soil, and if they decomposed rapidly, they would be of no use, as their only products are carbonic acid and water, which are not regarded as manure, as the atmosphere and water supply plants with both in abundance.

Home Correspondence.

The Flax Question.—The importance which the flax question has lately assumed is daily increasing by the existing state of our political affairs with Russia, upon which country we depend for two-thirds of our foreign supply of flax. The imports of flax of the different foreign States into the United Kingdom, during nine months ending the 5th of October, 1853, reach already 62,264 tons; and, as the imports of the last three months of each year are generally the most extensive, it may be stated, without exaggeration, that the imports during this year will, at least, amount to 100,000 tons; and, at the exorbitant price of 100*l.* per ton—to which the average price of foreign flax has already risen—will show a sum of 10,000,000*l.* which will be paid in cash for foreign flax fibre this year. Upon Russia we are also depending for half of our supply of sowing flax-seed. Already, 75,000 barrels have been shipped for us at the different Baltic ports, at the high price of 45*s.* per barrel, or 15*s.* per bushel. The imports of flax-sowing seed, crushing seed, and oilcake, will not amount to less than 4,000,000*l.* during 1853; so that the two above items will make a round sum of 14,000,000*l.*, which will go into the coffers of foreign nations, as they take nothing in exchange from us. The United Kingdom is the emporium of the four great textile manufactures of the globe—flax, cotton, silk, and wool—for the supply of the raw material of each of which we are depending upon foreign nations. With the two latter, however, we can be abundantly supplied from many countries; but not so with cotton, and much less so with flax; Russia, Belgium, and Holland, being the only quarters from whence it can be obtained to any considerable extent; and, consequently, if those supplies were intercepted, one of our great branches of national manufacture and commerce would be at a stand-still. Of all the aliments required for our four great textile manufactures, flax is the only one which our soil can produce in abundance. *F. Deman.* [Mr. Deman is about to publish the results of his experience in a work on the cultivation and management of flax. The above is extracted from a printed circular in which the contents and design of this work are advertised.]

Proper time to apply Lime and Manures.—How does lime answer, applied as a top-dressing to first year's Grass, say immediately on the removal of the white crop in September or October? This question is of great importance to Scotch farmers, and indeed an article on the proper time to apply lime in light as well as heavy soils would be of great interest and utility. That, and the question of when we ought to apply manures, whether on lea, with Turnips, or after them, are, in fact, the great practical problems of the north countrymen. Each system has its advocates, and some adopt all the three—manuring for lea crop, for Turnips, and after them; but this needs a long purse. If you can find time and space to give any information on these points, please give us experience to back science, otherwise some may sneer; not so—*Jock o' Scot.* [Will any of our friends in the north give us the experience here asked for? People must be guided by experience acquired in their own localities.]

Gorse Crushing.—Your correspondent "B. Blackburn," whose valuable suggestion on the application of the fibre of Gorse to paper making appeared in No. 17 of your journal, would confer a favour upon the subscriber, and perhaps upon others, if he would state what machine and what process he uses for reducing the Gorse into horse food; and, also, whether he cuts over the same Gorse plant annually, and with what implement or tool? These may appear to him trifling questions; but there is full evidence that the Gorse is a valuable fodder plant, if we can manage to use it economically. I have used it this winter for cows and fatting stock, by cutting it with a chaff-cutter into half-inch lengths, and then (adopting a suggestion of a correspondent of yours) spreading it upon uncut straw, and so passing it a second time through the chaff-cutter. In this form it was then incorporated in the mass of cut Mangold Wurzel, straw, chaff, cake, and meal, with which I usually feed, and was eaten without difficulty. But the process of chaff-cutting seemed to involve too much wear and tear, and too much labour; and I shall be glad to hear Mr. Blackburn's plan. *Alexander Hall Hall, Watergate.*

Notable Effects of the Frost of April 25.—Those who take interest in the meteorology of seasons can hardly have failed to notice the singular beauty of the weather during the four first months of the present year. There have been many and surprising contrasts, however, and among these was the extraordinary change of temperature which occurred on the night of the 21st. Previously, the mean heat of every day had been above the usual average, that of the 19th, 20th, and 21st being 14°, 13.6° and 11.6°. At 10 o'clock, P.M., my night thermometer was read off at 58.8° Fahr., the wind E.N.E. At that point or at N.E. it remained, and every day became colder. On the 24th I found the instrument at the freezing point, 32°, and on the 24th night it fell to 26° (*i. e.*, 6° of frost), but 1½° below Mr. Glaisher's register. In my long experience, I have frequently known and observed the effects of keen night frosts, but I never saw so much arbitrary damage done in a garden before. The catalogue might be extended very far, but as it is my object to confine my remarks to subjects chiefly connected with agriculture, I restrict them to one subject, and that is the present condition of the Oaks and Ash trees, as this has of late years been thought to furnish an index of the weather of the coming summer. Until the change of temperature on the 21st, the Oaks generally appeared to be in advance, the buds swelling, and in many cases having expanded; whereas, the Ash evidently lingered, though here and there one observed a few weak blossoms. After the 26th, the Oaks became perfectly deformed, the leaves burnt up, and the young shoots killed back. On the 13th inst. I had opportunity to inspect Oaks of several varieties in different localities. All had suffered; but while in many instances verdure had been reproduced, yet in others great torpidity prevailed. As to the Ash, it gave no signs. Life itself in several young trees might be supposed to be extinct. I cannot refrain from calling attention to that extraordinary and peculiar electrical condition of the earth and atmosphere, which must have prevailed at the point of time above alluded to. *J. T., May* 17.

Societies.

ROYAL AGRICULTURAL SOCIETY.

Lecture on Animal Development as Indicating Age, *May* 17: Mr. Raymond Barker, V.P. (chairman of the veterinary committee), in the chair. The secretary having announced a communication from the Earl of Clarendon, informing the Society that a French Imperial decree had been issued abolishing the export duty on the manure manufactured in Paris, under the name of *Poudrette*; and a present from the East India Company of a supply of fresh Deodara Pine seeds from the Himalayan district of India, well adapted for growing useful and ornamental timber on the poor hilly, or well-drained soils of this country; Professor Simonds, the Veterinary-Inspector of the Society, proceeded to deliver the first part of his Lecture on the Indications of Age, furnished by the structure of the teeth and the general developments of growth in cattle, sheep, and pigs. On this occasion he confined himself to the indications furnished by cattle, reserving for his second lecture the consideration of those connected with sheep and pigs. The discussion of the various points brought forward was of the highest interest in a scientific and practical point of view, and their elucidation strikingly promoted by the lecturer's continual reference to a great number of coloured diagrams on a large scale. He particularly alluded to two of the results of his own investigations on the tructure of the teeth, as being, he believed, perfectly new to physiologists. 1. After describing the dentine enamel and crusta petrosa as the constituents of the teeth, and also explaining the so-called ostro-dentine, he remarked that the latter substance did not fill the pulp-cavity in an old tooth of any of the domestic Herbivora. The obliteration of this cavity is effected by the pulp continuing to form dentine, and not by its ossification or conversion into ostrodentine, as stated by writers on the structure of the teeth. 2. In proportion as the pulp diminished, so was the supply of nutrition to the tooth cut off from the inside, and to provide for this the dentinal tubes in the fang became changed into bone-cells; or in other words, the crusta increased at the expense of the dentine, and thus the tooth drew its nourishment from the blood sent to the sockets in which the teeth are embedded.

In reply to a question by Sir John Johnstone, Professor Simonds had no doubt that the teeth of horses would, to a certain degree, be affected by the same general forcing system; but at that time, no data connected with that point had been collected, and he was consequently unable to give more than a general opinion of the probable result of the adoption of such a course in the case of the horse. On the motion of Mr. Towneley, seconded by Sir John Johnstone, the best thanks of the meeting were then voted to Prof. Simonds, for the very able and interesting discussion of facts he had submitted to them.—The Chairman announced that the concluding part of the lecture would take place at 12 o'clock on Wednesday next; and that Prof. Way's lecture, fixed for the 31st of May, would be postponed, in consequence of the Derby-day at Epsom falling on that date.

Farmers' Clubs.

Oxford, *May* 10: *The Geology of the District.*—The Rev. Mr. Clutterbuck, of Long Wittenham, delivered a lecture on this subject. Mr. Clutterbuck said it must be an interesting thing in Oxford, and among farmers, to remember that the first great laws of geology were discovered by the son of an Oxfordshire yeoman living in the neighbourhood of Chipping Norton. This was a person of the name of William Smith. The great leading principle by which the order and positions of the strata were determined was laid down by him in a way that could not be controverted. To his exertions might be said to be due that upon which the fame and fortunes of English geologists were built. The great law in English geology which he discovered, and which had not until then been ascertained or fixed, was this, that all the strata of the earth—those different bands or layers, as they might be called, whether of limestone or sand, or clay, lay upon each other in a regular order of succession. It was by the observation of this fundamental law, and being enabled to perceive how invariable it was, that they were enabled to lay down those great principles which made geology practically useful. Mr. Clutterbuck then referred to diagrams and sections illustrative of the geology of the district, describing the arrangement of the beds between the upper chalk and great oolite, comprising the greensand and gault and Kimmeridge clay, and the upper beds of the oolitic series. No county in England, perhaps, had a greater variety of geological formations than Oxfordshire, and this circumstance materially affected the character of the agriculture in different parts of it. Thus in the vale of Aylesbury they had the fattening of cattle, and the production of butter, carried on to a great extent, which was owing to that tract being upon the Kimmeridge clay and the Oxford clay. In another part of the county sheep farming prevailed extensively, which was owing to the healthiness of the Downs, and the oolite districts, which were naturally drained. If, therefore, a person asked why is Oxfordshire a great sheep-breeding county in one place, and a great dairy and butter-producing county in another, the answer would be, because the geological formations are adapted to this variety. Below the chalk he came to what was called the greensand formation, and there was none in this district more interesting than that. He thought it was perhaps the most fertile of all. The greensand formation was known in the district by the name of rubble. It contained an immense quantity of what was called the soluble silicate, which was quarried and largely used as a manure on the upper green sand formation at Farnham. It was found in that district which extended from the Chiltern Hills at Watlington to Ardington in Berkshire. Mr. Paine discovered that band of green to be a most fertile soil. He found he could grow Hops, Wheat, and most other crops upon it. This was due to the presence in it of phosphatic nodules containing phosphate of lime. He believed it was one of those formations which, if properly managed, would be found most valuable to the agriculturist. It extended, as he had said, from Watlington all down the vale of Berks. He thought it might answer very well to be used for mixing with other land in manuring. Passing on from that, they came to the gault clay; it was a good strong clay—and when properly cultivated had its advantages. The Nuneham gravel was found to be totally different from the gravel found on the Dorchester gault. That gravel covered a great portion of the gault clay. To pass on to the next soil, in the lower greensand, there was a feature ruled by geological conditions bearing strongly upon agriculture. Where the soil consisted of this lower greensand there was a disease of the Turnips prevalent, known as "fingers-and-toes." Why was that? It was because of the absence of lime. Now, he had before him some of the dirt which he gathered from the road as he came along that morning—it was produced simply by the pounding of the road. It had been found that the application of that road dirt, consisting of the gravel pounded up, did much towards curing the tendency of the lower greensand soils to produce the disease he had mentioned. The reason of this was obvious—it contained 50 per cent. of lime, and if put upon that land it cured the disease by affording the material in which the land was deficient. He had once told a farmer to put the whole of the road-dirt he could scrape together upon his land. If he were put anywhere in that country he could undertake to show where they would have that disease, merely because he knew the composition of the soil. The practical application was plain. If he were a young farmer, proposing to take a farm on land of that description, he would insist upon having an allowance on account of that tendency in the soil, or he would not take the farm. The importance of such knowledge was therefore very evident; for they all knew the value of the Swede crop. Those gravels were important, because they indicated that wherever they existed, persons would find the clay if they dug deep enough. But there was another question connected with the clays which ought to be borne in mind, because it was essential. He (Mr. Clutterbuck) was accustomed to write letters to the *Gardeners' Chronicle and Agricultural Gazette* touching any new point he might alight upon in the course of his investigations, merely putting his initials to his letters; and it sometimes happened that in this way a lengthy and interesting correspondence was elicited. Now, the point he was about to allude to was one upon which he had written to that paper, and his letter brought out an interesting and important correspondence on the part of Mr. Bailey Denton and Mr. Trimmer. It was found by Mr. Trimmer in his draining operations—and it was a point of which agriculturists should be well aware—that there was a wavy condition on the surface of the clays; in other words, that the clays were in waves. Mr. Trimmer had to drain land of that description in the Keythorp drainage. He found that it was necessary to cut across these waves—because if he did otherwise, if he drained lengthwise with the waves, he carried off only that water which was in their troughs, whereas, if he cut across them he had water from a number of channels flowing into the drain. All the clays covered by the gravel were wavy; therefore, if they did not make trial holes, to ascertain how the wayes lay, they might happen to be cutting along these waves instead of across them. Coming up by Rosehill this condition of the clay was plainly to be seen; it had the appearance as of a ditch which had been cut and filled up with gravel; he had seen it at Thame particularly; and he found it on his own land, where, if he cut in one direction, he drained only partially, while, if he cut in another direction, he drained all that was required. He had seen it on the Kimmeridge clay, and on the Oxford clay. It was remarked by Mr. Trimmer that the Oxfordshire great oolite, the stone brash and forest marble, and inferior strata, cropped out at different levels; that in fact there was a series of croppings out of these strata; and Mr. Trimmer said, that the influence of the rock formations on the agriculture of the county was here at its maximum; that is to say, agriculture was here more dependent upon the original state of the soil than upon any other cause; and this was owing solely to the breaking up and intermixture of the laminæ or bands of different soils or rock formations. They became rubbed up as in a mortar, and produced a tolerably good soil. That was the process continually going on in nature; and every man who had a farm in a district of this condition must have observed the variations, though he might not be aware of their value to the soil. Therefore the influence of the natural rock on agriculture was at its maximum where that variety and intermixture of soils prevailed; so that if there was any part where people should be *au fait* at geology, it ought to be there. It was there where Wm. Smith lived; it was there the great father of geology learnt his first lesson, as in a book, the leaves of which he had opened and studied; he saw all this cropping out and mixing of soils, and thus he arrived at the defining of those laws upon which the world was constructed.

Reviews.

The History of Wales. By B. B. Woodward, B.A. Virtue, Hall, & Virtue, London.

With much of this work, however interesting it may be to the antiquarian and admirer of legendary lore, we do not reckon that the readers of an agricultural periodical can have any very great sympathy. The origin of the Welsh, as a people distinct and almost alien to their Saxon neighbours—their numerous and arduous struggles, first to uphold, and, failing this, to regain their national independence — their final subjugation by Edward I. completed by Henry VIII. in his Act of 1536, professing to abolish all distinctions either of laws, customs, religion, and even language, between his English and Welsh subjects—the history of the bards and bardism; these and other topics, directly or indirectly connected with them, we pass over, contenting ourselves with a general reference to the work itself, merely premising that the perusal will amply repay the trouble to all who are curious in such pursuits.

The work opens with a description of the geographical and geological features of the country, the most conspicuous of which are its mountain ridges—"That of Snowdon covers nearly the whole of Caernarvonshire. It rises 3571 feet above the sea." (P. 2.) Various others follow, of heights fluctuating between 1500 and 3000 feet, the highest being found in North Wales, though there are instances in the South of considerable elevations; for instance, "one on the borders of Caermarthenshire of 2598 feet; and the Beacon of Brecon, 2862 feet high." (P. 3.)

We thought to have dwelt awhile on the geology of this very singular and interesting portion of the empire, but we find that, to do so with any effect, would occupy a larger space than we can devote to it; and therefore must leave Mr. Woodward to propound his own theory of the various formations in his own way. (See pp. 7—19.)

A few brief remarks on the agriculture of Wales occupy the concluding part of "the History." We could have wished this subject had formed a more prominent feature of the work, even at the expense of some of the legendary and somewhat obscure traditions therein narrated. In common with almost every one who has treated of the subject, our author speaks but slightingly of Welsh farming, and we fear with too much truth; for most certainly, as a general rule, it cannot be denied that "want of capital is perceptible at every turn; the farms generally small; * * * there are very many small landholders; and not only is the husbandry, generally, of the rudest description, but drainage, artificial manures, and improved implements, are almost wholly unknown." (P. 584.) Welsh mutton is justly appreciated by every epicure; and, whatever may be said of the wool, nobody will question the excellence of Welsh flannels, wigs, and mittens.

The neglect of, and even antipathy to, the most obvious improvements, if costing money (and what improvements do not cost money?) border upon the ludicrous; as, for instance, the objection to drainage by one sapient agriculturist, because it would rob him of Rushes for thatching! (P. 584.) Scotch and Norfolk farmers will stare at the following specimen of Welsh arable management—"Oats, Potatoes, Barley, with Grass or Clover, Oats, Potatoes, Barley, Oats, and then left to chance." (P. 584.)

It is useless, and not very agreeable, to expatiate on the sins of omission and commission but too often exhibited by our Cambro-British brethren of the soil; in justice to whom we are bound to observe that, as there are no rules without exceptions, so in Welsh farming, however imperfect it may be as a whole, we could adduce instances both in North and South Wales of an energy and skill in cultivation which would not disgrace our most celebrated agricultural districts. Our acquaintance with the principality is of more than 50 years' standing, during which period our opportunities of observation have been frequent. We do not therefore speak without book when we deliver it as our opinion, that a change for the better is slowly but surely going on; and that both in quality and quantity the crops, both of corn and Turnips, are often such as any farmer in any county might be proud of. Nothing surprised us more than the extension of the growth of Barley and the general excellence of the crops. The mowers and reapers of Wales may serve as models for those of far more enlightened districts; and there are many points in their harvest management well deserving the imitation of all practical farmers. We close our observations on this subject with a few words calculated, as we hope, to mitigate the severity of criticism on these matters, though we by no means seek to justify wilful ignorance or narrow prejudice. The farming tourist should take into account the natural disadvantages with which the Welsh, in common with the inhabitants of all hilly countries, have to contend. Not only is the expense of tillage much heavier than that of more level land, but the work cannot be so effectually performed. The required depth of soil can never be obtained, or, if obtained, is constantly liable to be carried off the hill-sides to the valley beneath, not only to the detriment of the field, but often to the partial loss of the crop itself. For this natural defect there can be no adequate remedy. Another annoyance to which the mountain farmer is

particularly liable is the superabundance of moisture in the atmosphere, occasioning not only present injury, but often deterioration by their backwardness in ripening. Even when rain is not actually falling, the hills are frequently enveloped in thick mist ("*niwl*," they call it), which penetrates one's clothing, and is often a serious impediment to the operations of the harvest*. This moisture will sufficiently explain the reason why Grass preponderates so largely over arable land. In drier and more level situations there is often as good farming as can be found in any district; but, then, it must be borne in mind that these spots are selected by men of capital and enterprise, leaving the mountain sides to the aborigines—men of but slender capital, and for the most part little above the condition of farm-labourers.

We have deemed it but fair to say thus much of the natural obstacles in the way of Welsh agriculture; and shall only add, in conclusion, our conviction that as railroads increase, and the influence and exertions of the Royal Agricultural Society are extended thereby, so will the progress of knowledge in rural affairs; and a general, though probably a very gradual, application of mechanical skill to the cultivation, even of mountain lands.

Farm Memoranda.

FARM OF MYREMILL.—[The following is the account of a visit paid by Mr. Home many months ago which appeared in the *Berwick Warder* of last year and which we publish now, as bearing upon the subject of liquid manuring, which has again come up for discussion.]—Visited this farm, and had the good fortune to find Mr. Kennedy at home. Spent several hours walking over the farm, and inspecting minutely all his arrangements for distributing liquid manure. Received also from him, most freely and frankly, information on every point which it occurred to me to put to him. The whole extent of his farm is about 800 acres imperial; nearly one-half is tilled, so as to be capable of being irrigated with liquid manure. Hydrants—one or more are in each field, to which he attaches a gutta percha hose, for distribution. He considers that there should be a hydrant for every two acres imperial. It is only to the part of his farm under irrigation, to which my remarks will apply; and to give practical farmers an idea of the nature of the crops grown on it, and of the stock which it supports under the above system, I may state the following particulars, kindly furnished to me by Mr. Kennedy:—

I. Corn crops	... ...	Wheat ...	125 imperial acres.
		Oats ...	187 do.
II. Green crops	... ...	Turnips ...	125 do.
		Cabbages	12 do.
		Carrots ...	12 do.
		Mangolds	6 do.
III. Grass	... ...	Italian Rye-grass	87 do.
		Clover, &c.	

The following are the quantities of these several crops in so far as I ascertained them:—Oat crop last year (1851), produced 10 quarters per imperial acre; Swedes last year 30 tons ditto; Cabbages last year 44 tons, this year 40 tons; Carrots last year 23 tons, this year 16 tons; Mangolds this year 25 tons per imperial acre. Mr. Kennedy mentioned, that last spring the weather was particularly unsuitable in Ayrshire, for both Carrots and Cabbages. The latter he would have lost altogether had not the land been piped. Italian Rye-grass yields a crop of about 40 tons per imperial acre—when there are six cuttings. This year, however, owing to the drought, he had only four cuttings. The following is his mode of management for this Grass. He sows from the middle of March to the middle of April—waiting till severe frosts are all over—at the rate of 4 bushels to the imperial acre. Mr. Kennedy allows his Italian Rye-grass to stand for two years, the second year's crop producing a larger and an earlier produce than the first year's. Immediately after every cutting, he gives to the land what he terms a slushing with liquid manure, at the rate of about 4000 gallons per acre, the manure being diluted. In regard to the preparation of the land for this crop, it is ploughed in the previous autumn, and dunged. Whenever the plant brairds, it is irrigated with tank manure. Mr. Kennedy had his first cutting of Italian Rye-grass this year on the 18th of April. On ground well prepared and well manured, he has seen this crop grow in the four summer months at the rate of 1½ inch per day.

IV. In regard to stock, Mr. Kennedy informs me, that at the time of my visit he had on the farm 376 cattle, 1000 Cheviot wethers, 400 clipped hogs, 1000 lambs, 300 ewes, 200 pigs. During the last two years he has fed and sold on an average 560 cattle and very nearly 3000 sheep. In regard to the mode adopted at Myremill for feeding stock, I may explain: 1. As to cattle, that most of them are tied up in byres—that there is a considerable number in boxes; two in each, and a few only in sheds with open yards in front. 2. As to sheep, that a certain proportion pasture in the usual way during summer on common Rye-grass and Clover, and a considerable number in pens, under covered sheds, there being 10 in each pen. I saw 460 in these pens. 3. As to pigs that they are in pens also under cover—there being a row of pens, both for them and the sheep, on each side of a long passage, from which food is conveniently put into their troughs or cribs. The cattle and sheep which are confined for feeding, are fed during the summer chiefly on Italian Rye-grass—a little Rape-cake being added for both. When the Rye-grass fails, which is the case about the middle of October, the Cabbages take their place; from the end of November to January the Globe Turnips are used—the Swedes succeed till March, and after them the Mangolds, till the Italian Rye-grass again commences the series. Mr. Kennedy considers Italian Rye-grass superior to red Clover, for feeding, not only as being more nourishing, but as never producing any coursing effects. The same remark applies to Cabbages. He considers them more valuable than even Swedes for both cattle and sheep; moreover, with them Rape-cake will be freely eaten by any animal when it would be refused with other things. A little molasses is occasionally mixed with the Rape-cake to make it palatable—when larger quantities are given. He mentioned that whenever Rape-cake is given to either cattle or sheep, water should be freely supplied. The cattle which are fattening off, are thus treated—During summer—besides the Italian Rye-grass which they get morning and evening—they have about mid-day, a compound of Rape-cake, Bean-meal, and molasses, at a cost never exceeding 5*s.* a-month for each animal, with hay or straw chopped and steamed. In winter each animal—weighing from 6 to 7 cwt. gets at 6 A.M. about 80 lbs. of roots; at noon, a feed (weighing about 16 lbs.,) of the above-mentioned compound, which is given warm, and afterwards some Oat-straw. At 8 P.M. they get another supply of Turnips, viz., 80 lbs. for each animal and more Oat-straw. The sheep are treated much in the same way; the maximum cost of fattening them is 1*s.* 2*d.* per month for each animal. Mr. Kennedy gave me some interesting particulars as to the quantity of stock which can be supported by an acre of Italian Rye-grass during the six months of summer and autumn. The result of his experiments has been to satisfy him that 1 Scotch acre of this crop will support seven bullocks, or five cows, or 70 sheep. One year he fatted 80 sheep from 1 Scotch acre, with the help of ½ lb. of Rape-cake daily to each. These results he ascertained by weighing the quantities given. During the early part of last summer, the 460 half-bred hogs which I saw in pens consumed each daily about 12 lbs. of Italian Rye-grass; during the next two months, 11 lbs.; and latterly, when they were getting fat, about 9 lbs. The total quantity thus obtained from the four cuttings during last season was, as already stated, found to be about 50 tons per Scotch acre. Mr. Kennedy informed me that, in the summer of 1851, he put sheep into his pens on the 1st June, and sold them fat in October with a good profit; and that this year the 460 which I saw, were put in about the end of May, having been purchased at a price of 19*s.* each. I have learned that he, about the middle of November last, had been offered for them 37*s.*, which he had declined, feeling satisfied that he would probably get 40*s.* for them. Mr. Kennedy considers that there is no part of his system so likely to yield a good return as the feeding of sheep under cover, and on sparred boards, through which the whole dung, both solid and liquid, falls into gutters. These are flushed from time to time with water, and thus the contents are swept into the tanks. He estimates the value of this manure at 5*s.* to 6*s.* yearly for each sheep. He believes that it contains more ammonia than the dung of other animals, as it ferments more rapidly in the tanks. As Mr. Kennedy feeds some of his sheep out of doors, he is able, and has endeavoured to ascertain precisely the points in which the one mode of management is superior to the other. One point is that already noticed, as to manure, a great part of which—about a half, he thinks, is lost when it is voided on the land in pasturing. Another point of superiority he conceives to be in the better health of the animals and their greater rapidity in fattening, especially during winter. If it be supposed that in summer, sheep would suffer from the heat by being confined under cover in pens, I may mention that Mr. Kennedy lost only one sheep last summer and autumn from inflammation, out of the 460 confined. Effectual means of ample ventilation are taken in the construction of the sheds. One very curious fact was stated to me, by Mr. Kennedy, that the fleeces of the sheep confined in these pens weigh on an average nearly 2 lbs. more than those which have pastured during the previous year out-of-doors; besides being improved in the staple of the wool; and he added, that Mr. Mangles, M.P., who had visited his farm, on the morning of the day when I was there, had informed him of his having ascertained the same thing, in his own experience, as he follows the plan in Essex, of keeping sheep under cover. Mr. Kennedy, I have said, pastures some of his sheep out-of-doors. He this year tried to discover how many sheep could be in this way kept on Italian Rye-grass. He put a certain number of half-bred hogs into a field, confining them by hurdles to a measured portion, until it was eaten bare, and then moved them with the hurdles to another portion. The result was that he found 20 sheep could in this way be fed by 1 acre. They were put into the field on the 1st of June, and were sold fat in the end of October. This experiment seems to prove that Italian Rye-grass when pastured, will yield nearly four times the amount of food which is generally afforded by our Rye-grass and Clover, but that when cut and taken to stock in the farmyard, it will yield more than 12 times what is generally afforded by our Rye-grass and Clover fields. I believe that the ordinary calculation is that 1 acre of our Grass land will support on an average only five or six sheep. In regard to the quantity and kinds of manure applied by Mr. Kennedy to produce the heavy green crops which I saw on his farm, I learned the following particulars:—For Cabbages, he prepares the land in the previous autumn by ploughing in about 18 tons per Scotch acre (or 30 loads) of farmyard dung. He also sows 3 cwt. of Peruvian guano, and 4 bushels of superphosphate of lime, followed up by several slushings of tank manure. Mr. Kennedy does not rear his own Cabbage plants; he buys them in spring wherever he can get them, paying at the rate of 2*s.* 6*d.* to 3*s.* for each thousand. They are dibbled in during the month of March, at a distance of 20 inches apart every way. For Swedes, Mr. Kennedy prepares the land by ploughing in 7½ tons per Scotch acre of farmyard dung, followed in spring by 6 bushels of superphosphate of lime, and about 3000 gallons of tank manure. Mr. Kennedy considers that the manuring thus given, may be extended, with the effect of increasing his root crops, in a degree which will more than compensate the outlay, and for this purpose he wishes to have additional tanks. His only fear is, that the subsequent corn crops may lodge from rankness and softness of straw; to obviate which, he intends to lay on the land a mixture of lime and salt, to be dissolved in his tanks with water, and distributed by means of his pipes. The only green crops which Mr. Kennedy has sold off his farm, are a portion of his Carrots; and he got for them last year 2*l.* a ton. Mr. Kennedy has four separate tanks, capable of holding about 75,000 gallons each. The object of having so many is to allow of the manure remaining long enough to undergo fermentation, before it is applied to the land, and also to keep the manure, till such time as the land is prepared for receiving it. The only other remark which I have to make in regard to Myremill, is as to the expense of irrigating; I called Mr. Kennedy's attention to a report recently published by the Board of Health in London, where it is stated that the capital required for these arrangements amounts to 3*l.* 19*s.* per acre. He remarked that this was made out by taking into account the whole expense of the steam-engine, which was not fair, as this engine performed many other things besides—such as threshing corn, cutting straw, slicing Turnips, &c. Moreover I may observe, that a considerable expense was incurred in bringing water to the homestead; it had to be raised from a burn situated 400 yards off, and 70 feet below the level of the steading, by very expensive machinery. Making due allowance for these items, the amount of capital which was really required for irrigation may be stated at 3*l.* 10*s.* per acre. In regard again to the annual expenses, the Report of the Board of Health states it at 14*s.* per acre; but the result is brought out by charging 7½ per cent. on a capital of 1586*l.*,—which is 86*l.* too much; by charging the whole wages of the farm servants, whereas only one-fourth should be imputed to the irrigation arrangements; and by charging the whole fuel for the engine instead of a half. If a deduction is made for those items, the annual cost per acre would be 10*s.* instead of 14*s.*, as alleged.

* A friend of ours once took a farm (a great prize as he thought it) in South Wales. He had splendid crops, but such difficulty in harvesting them that he was literally obliged to cut and run.

Miscellaneous.

Wheat Bran.—M. Mouriès has presented to the Academy of Sciences a memoir on the proximate principles contained in Wheat bran, and on the part they play in bread-making and in animal nutrition. Bran contains starch, azotised matter, and a coloured pellicle which is considered to be ligneous. Flour from which the bran has not been separated is known to furnish a sort of bread which many physicians prescribe in cases of habitual constipation, and where there is a tendency to congestions on the brain. It is also known, on the authority of Majendie, that dogs live when fed on brown bread, whilst they die when fed exclusively on white bread. What is the reason of this difference? What part does bran play in alimentation. It cannot be solely owing to the nitrogen of its proximate principles; for the relative quantity of the former is small compared with that found in the fine flour. M. Mouriès has discovered that the internal surface of bran contains several azotised principles, the characters and species of which are still to be determined. But these principles combined dissolve in tepid water, and, like diastase,* possess the remarkable property of liquefying starch, converting it into dextrine and sugar; it is therefore principally by inducing a sort of fermentation that bran acts in a peculiar manner in bread making, and afterwards in digestion. Let a certain quantity of common starch heated to between 104° and 113° Fahr. be divided into two parts. Let water in which bran has been steeped when the water was tepid be added to the first portion, and an equal quantity of distilled water to the second, it will be found that the greater part of the first half of the starch, that to which the bran water was added, will dissolve, whilst the second half will not undergo any change. Water containing iodine will colour the first portion purple, and the second blue. One thousand grains of starch in 15,000 grains of water, mixed with 1000 grains of water in which 200 grains of bran had been steeped when tepid, became liquefied in 20 minutes at the temperature of 104°. After two hours, the solid residue was 151.3 grains; and the water when evaporated left 850 grains of dextrine and sugar. The active matter of bran-water differs from that of Barley or of diastase, inasmuch as its action is destroyed when it is precipitated by alcohol; whereas that of diastase is not. Moreover, to produce the same effect on the former, a temperature of 167° is sufficient; whereas the latter requires

[* The substance contained in malt which converts starch into dextrine and grape sugar. It is said that 1 part of diastase will convert into sugar 2000 parts of starch.]

from 208° to 212°. The effect of bran in bread is in conformity with the preceding: for 130 parts by weight of this bread, supposed to be dry, pounded with 520 parts of water, readily divides, and at the expiration of three hours, in a temperature of 104°, the mixture assumes a milky appearance and may be filtered. The following are the proportions of soluble and insoluble matter contained in the brown bread :—

Soluble matter dried at 212°	59·25
Insoluble matter	6·75

One hundred and thirty parts of white bread, supposed to be dry, pounded with 520 parts of water, only form, after long trituration, at a temperature of 104°, a half solid mass, represented as follows :—

Soluble matter	9·03
Insoluble matter	12·25

It appears that the action of the bran on the fine flour commences when the paste is being formed, increases whilst the bread is being baked, and is only completed in the stomach. The experiments of M. Mouriès, therefore, explain the difference between brown and white bread by the action of the bran on the starch, the bran being present in the brown bread, and absent in the white bread. *Comptes Rendus, Nov.* 21.

Calendar of Operations.

MAY.

FORFARSHIRE GLENS. *May* 9.—The winter has passed over with less than average severity. The storm which commenced at Christmas continued unabated until January 16, when a thaw set in with a westerly wind: during the remainder of the winter the weather was unusually fine, generally breezy, often blowy with several heavy gales, the direction of the wind generally westerly. All spring phenomena appeared unusually early: frogs were abroad by the middle of February, and immigratory birds generally anticipated their ordinary time of returning by several weeks. Vegetation came also considerably in advance. fertile spots began to wear a verdant aspect by the beginning of March, and everything both in field and garden bore testimony to the mildness of the season. Last year, up to March 25, all surrounding objects were cold and white as a winding sheet. Field operations are in a forward state; sowing of Oats commenced about the second week of March, and was generally concluded by the end of the month. Here, the crops which follow a March seed time are both best matured and best secured; the time from sowing to ingathering is seldom less than between five and six months, and when the seed time is cast back into April, the harvest is generally into October. With the day short, and the night long and cold, the corn is imperfectly ripened, and there is but little drought to prepare the sheaves for the stackyard. April was a dry month, and favourable for sowing Barley, planting Potatoes, and preparing Turnip land. Since May began the weather has been more genial, showers frequent, and vegetation progressing. Winter provender has, with the utmost economy, been barely sufficient to bring forward the usual stock, but Grass appearing early was a relief, and had an animating effect upon the spring markets. Fed stock, both cattle and sheep, still command high prices, and, notwithstanding the reiterated assertions of some crack farmers to the contrary, do pay; in fact here, the live stock is by many considered the best paying department of the farm; but we do not give oxen 8, 10, or 12 lbs. of oilcake daily at 1*d.* per lb., besides other food, and expect that to pay, while the increase of the animal is not more than 1 lb. of beef during the same period. They are allowed as much straw, or hay and Turnips, as they can consume, and sometimes, but not generally, a little bruised light corn for a few weeks before being turned off: and cattle so fed, the pure Angus *doddies*, seldom fail to command the highest prices in the London markets. Here also we can make pigs and poultry to pay, but we do not feed them upon marketable produce, but keep them in the position which they are obviously intended to occupy, viz., the scavengers of the farm: as such, if their numbers are kept in due proportion to the other parts of the establishment, they will always be found profitable. The flocks have come well through the winter; for three weeks they had little but whins, but where there is plenty of that kind of food a storm of short duration is considered advantageous rather than otherwise, causing them to take to the rougher herbage, which otherwise would be neglected. The dead list is shorter than usual: where ordinary care has been bestowed, none have fallen victims to poverty: the season of braxy has also passed over with much less than the usual mortality. The lambing season commences about April 9, the greater proportion being dropped between the 15th and 30th. A few lambs have fallen after being eight or ten days old, from some unknown cause, but ewes being in good condition, and other circumstances generally favourable, the crop is likely to be fair. The season has been highly favourable for heather burning, yet but little advantage has been taken of it: few tenants are now allowed to burn at will. Sportsmen finding their game generally among long heather, have rather rashly concluded that the more heather the better sport, and therefore when it can be prevented, do not allow the necessary amount of burning. When a wide district is left for a series of years unburned, the grouse invariably leave it: and for good reason, although they have abundance of cover, they have no food. In the arrangements of Providence, the interests of one class of animals are never opposed to those of another; and, as might be anticipated, what is best for the flocks is also best for the grouse, namely, to have a fair proportion of the moors burned every season: and were that always attended to, neither sport nor pasture would ever be wanting. The young heath and the small Fescue Grass afford the principal food of the grouse, as well as of the sheep, upon high districts, and both are in greatest perfection on newly-burned ground. *S.*

Notices to Correspondents.

FOOD: . We should prefer oilcake at 10*l.* and Beans at 11*l.* per ton to Oats at 10*l.* and Barley at 9*l.* 12*s.* 10*d.* We have had no experience of Indian Corn, but should not be inclined to buy it at 8*l.* 12*s.* per ton, when good oilcake was to be had at 10*l.* You will see boarded floors for cattle at Tiptree, near Kelvedon.

MANGOLD DRILL: *Chilwell.* We do not remember having received a question on the subject. We believe the best way to plant Mangolds is to send the Turnip drill up the rows, so as to make a furrow along the top of each ridgelet, and dibble the seed in these furrows, employing a stick about 14 inches long to mark the intervals, and to move the earth sufficiently to make a place for the seed.

TANKS: *J. M. A.* It depends on the quantity of liquid you collect in a week. A large sunk cask might be as good as any, and if baled out once a week and thrown upon a heap of vegetable matter, charcoal, &c., close by, the whole would be absorbed, and ready for use at any time.

TURNIP HOE: *H. W.* We have heard nothing further of the revolving horse hoe: we look upon it as not likely to be a generally successful implement. If any of our readers have had any experience we should be much obliged for it. It is made by Garrett and Son, Saxmundham. The catalogue says that the inventor hoed 120 acres of Turnips with it last year. We presume that the most it can do is to "bunch" the plants. Sawdust is perfectly good and satisfactory litter for cattle. We have seen it used in a house of 60 or 80 cattle with perfect success.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London, removed from Oxford Street.

LADDERS, BARROWS, ETC.

G. ELL invites the attention of Agriculturists, Builders, and Decorators, to the large stock of LADDERS, EXCAVATORS, BRICKMAKERS, AND GARDEN BARROWS, TRESTLES, STEPS, &c., he has always on hand at a very low scale of charges. A list of prices will be forwarded on application.—Manufactory, 3, Tottenham Court New Road, opposite Hampstead Road.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.

Extracts of Testimonials and references to persons using it.

"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*

"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*

"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*

"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bedicott, Oxon.*

"Has been working every day."—*T. Cardus, Barwell, Surrey.*

"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*

"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*

"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"

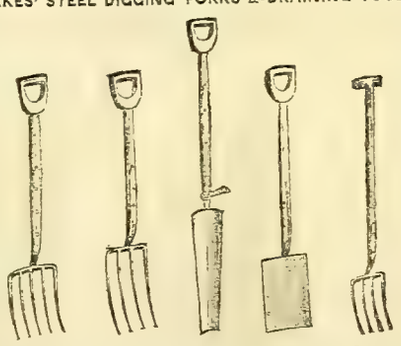
"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*

"Been digging all the week; the *champion* of all implements in England; should be very sorry to be deprived of it."—*Thomas Lawrence, Thurlaston, Dunchurch.*

"Well satisfied last year. Turnips were a superior crop."—*C. Brickwell, Overthorpe, Northamptonshire.*

Price 24*l.* 10*s.*, the general purpose size; and 27*l.* 10*s.* large size, Cash; at the Works, Banbury.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

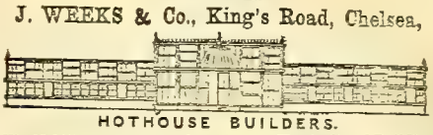
ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work: free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

JOHN WEEKS AND CO., HORTICULTURAL BUILDERS, King's Road, Chelsea, think it now necessary to inform the Nobility, Gentry, and Public in general, that they have NOT HAD ANY CONNECTION WHATEVER with the Edward and Alfred Weeks who LATELY carried on business at Chelsea. May 20th.

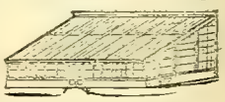
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Building or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

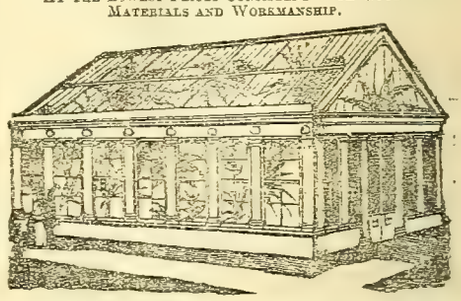
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings: also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

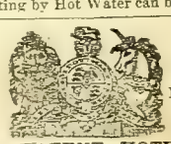


GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT



E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent: these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON AND BUILDER, PIMLICO MARBLE AND STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

OPENING OF THE CRYSTAL PALACE.—The Opening of the Crystal Palace is definitely fixed to take place on SATURDAY, June 10, on which occasion her MAJESTY has graciously signified her intention of honouring the Inauguration with her presence.

SEASON TICKETS.—Season Tickets may now be had at the Palace; at the Offices, 3, Adelaide Place, London Bridge, and 14, Regent Street; at the Brighton Railway Terminus, London Bridge; at Sams', 1, St. James's Street; Mitchell's, Bond Street; Gunter's, Lowndes Street; Westerton's, Knightsbridge; Keith, Prowse, & Co., Cheapside; Brill's Royal Baths, Brighton; Mr. Wm. Brooks, of No. 2, High Street, Southampton; and at Messrs. Smith & Son's Book Stalls on the Railway. Tickets, to include conveyance by Railway, can be had only at the Office of the Secretary to the Brighton Railway, London Bridge, and at 14, Regent Street.

HOLDERS of SEASON TICKETS ONLY will be admitted to the Opening of the Palace.

OPENING OF THE CRYSTAL PALACE, 1854. It is intended to OPEN the CRYSTAL PALACE and PARK on the 10th of JUNE, after which they will be open daily, Sundays excepted.

The following are the arrangements for the Admission of the Public:—

FIVE SHILLING DAYS.—On Saturdays the public will be admitted by payment at the doors, by tickets of 5s. each, and by tickets to include conveyance by railway.

HALF-CROWN DAYS.—On Fridays the Public will be admitted by payment at the doors, by tickets of 2s. 6d. each, and by tickets to include conveyance by railway.

SHILLING DAYS.—Mondays, Tuesdays, Wednesdays, and Thursdays will be 1s. days. At the gates, a payment of 1s. each will admit the public, or tickets entitling the holder to admission to the Palace and Park, and also to conveyance along the Crystal Palace Railway, from London Bridge Station to the Palace and back, will be issued at the following prices:—

Including first class carriage	... ...	2s. 6d.
Including second ditto	... ...	2s. 0d.
Including third ditto	... ...	1s. 6d.

CHILDREN.—Children under twelve years of age will be admitted at half the above rates.

HOURS OF OPENING.—The Palace and Park will be opened on Mondays at 9 o'clock, on Tuesdays, Wednesdays, and Thursdays, at 10 o'clock, a.m., and on Fridays and Saturdays, at 12 o'clock, and close every day an hour before sunset.

SEASON TICKETS.—Season Tickets are now issued at two guineas each, to admit the proprietor to the Palace and Park on the day of opening, and on all other days when the building is open to the public, up to the 30th April, 1855.

No Season Ticket will be transferable or available except to the person whose signature it bears.

FAMILY SEASON TICKETS.—Members of the same family who reside together have the privilege of taking Season Tickets for their own use with or without Railway conveyance on the following reduced terms:—On two tickets a discount of 10 per cent. on the gross amount; three tickets, a discount of 15 per cent.; four tickets, a discount of 20 per cent., and five tickets and upwards a discount of 25 per cent. Families claiming the above privilege, and desiring to avail themselves of it, must apply in a prescribed form, which may be had at the Office, 3, Adelaide Place, and at the other offices for tickets. These tickets will be available only to the persons named in such application.

Railway Season Tickets, including conveyance along the Crystal Palace Railway from London Bridge to the Palace and back, are issued by the London and Brighton Company, at their Offices, London Bridge. Single Tickets, 4l. 4s. each; Family Tickets at the same reduction as above.

SPECIAL REGULATIONS AND BYE-LAWS.—All the General Provisions and Regulations mentioned above are to be understood as being subservient to such Special Provisions, Regulations, and Bye-Laws on the part of the Railway Company and the Palace Company as may be found necessary to regulate the traffic, and to meet special occasions and circumstances which may from time to time arise.

By order of the Board,
G. GROVE, Secretary.

Adelaide Place, London Bridge, May 20, 1854.

NOTE.—Applications for Single or Family Season Tickets must be addressed to the Secretary, and accompanied by a remittance for the full amount of the Tickets asked for, according to the above Schedule, in favour of GEORGE FASSON, 3, Adelaide Place. Cheques must be on a London Banker, and be crossed with the words "Union Bank of London."

And no application, unless so accompanied, will be attended to.

THE EDUCATIONAL EXHIBITION will OPEN at ST. MARTIN'S HALL, the last week in JUNE. Parties intending to exhibit should apply forthwith for space and particulars to the Secretary of the Society of Arts.

(By order.) P. LE NEVE FOSTER, M.A., Sec.

Society's House, Adelphi, London, May 20.

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.

THE CHOLERA

PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts, 2s.; Pints, 1s.; Half-pints, 6d. Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

ASTROLOGY.—Persons residing in London or elsewhere can send any Address, Christian and Surname, and Age, in a letter containing 13 postage stamps, to Professor MELVILLE, Prince's Road, Lambeth, London (the only Acrostic Astrologer in the universe), and they will receive by return of post, special Poems on their names, in which their destinies will be revealed.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 29, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2l. 14s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s; Bronzed Fenders complete, with standards, from 7s. to 3l.; Steel Fenders from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s.; Fire-irons from 1s. 9d. the set to 4l. 4s. Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

TEA URNS, OF LONDON MAKE ONLY.—The largest assortment of London-made TEA URNS in the world (including all the recent novelties, many of which are registered) is on Sale at WILLIAM S. BURTON'S, from 30s. to 6l.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 17s.; Portable Folding Bedsteads from 12s. 6d.; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21s.; and Cots from 21s. each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2l. 19s. to 13l. 13s.

PAPIER MACHÉ AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Gothic Papier Maché Trays,

per set of three	... ...	from 20s. to 10 guineas.
Ditto, Iron ditto.	... ...	from 13s. to 4 guineas.
Convex shape, ditto.	... ...	from 7s. 6d.

Round and Gothic Waiters, Cake and Bread Baskets equally low

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads, and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.

HEAL AND SON'S Stock comprises a large assortment of handsomely Japanned and Brass-mounted IRON BEDSTEADS, CHILDREN'S CRIBS and COTS of new and elegant designs; MAHOGANY, BIRCH, and WALNUT-TREE BEDSTEADS, of the soundest and best manufacture, many of them fitted with Furnitures, complete; and every variety of SERVANTS' and PORTABLE BEDSTEADS. They have also a large assortment of

BED-ROOM FURNITURE, comprising WARDROBES, both in Japanned Wood and Mahogany, from 4 feet to 8 feet long, fitted with every variety of arrangement; DRESSING TABLES and GLASSES, WASH-STANDS, DRAWERS, and every article for the complete furnishing of a Bed-room.

HEAL & SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced List of Bedding, containing designs and prices of upwards of One Hundred Bedsteads (representing a stock of upwards of One Thousand), sent free by post.

HEAL & SON, 196, Tottenham Court Road, London.

TYLOR AND PACE have removed from 313, Oxford Street, to larger and more commodious premises, 104, New Bond Street, which will enable them to keep a much larger stock in all the different branches of their manufacture, including a very extensive assortment of Iron and Brass Bedsteads, Children's Cots, Portable Bedsteads, and Chair Bedsteads, with suitable Bedding and Mattresses. A Large Show Room is entirely appropriated to the exhibition of Baths and Toilette Ware of every description, all at the most moderate prices. An increased assortment of Venetian and all other Window Blinds, Outside Blinds, and Transparencies. Illustrated Catalogues of Bedsteads, Baths, and Window Blinds, are published separately, and will be forwarded post free on application by naming the description of article required.

TYLOR & PACE, 104, New Bond Street, London.

QUALITY THE TEST OF ECONOMY.—First Class DRESS COATS, 3l.; BOY'S SUIT, 11d. per inch, according to height, &c. The Best Article the Cheapest. The well-known VENTILATING WATERPROOF LIGHT OVERCOAT, 45s. W. B. trusts the established character of his business for half a century will prove a satisfactory guarantee.—W. BERDOE, 96, New Bond Street, and 69, Cornhill (only).

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton, Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand London," is impressed upon the Government stamp.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

This day, Seventh and Cheaper Edition, with numerous Illustrations, 2s. 6d.,

J. Matthews, 5, Upper Wellington Street, Covent Garden London.

BY WILLIAM KIDD, OF HAMMERSMITH.

KIDD'S SONG BIRDS: THE CANARY.—This beautiful little volume, price only 6*s.*, profusely illustrated and bound in cloth of gold, is now ready. It forms a complete Domestic Encyclopædia in all that appertains to the Canary as a Cage, Open Air, and Chamber Bird, and is the only practical work on the Rearing, Breeding, Feeding, Taming, Keeping, &c., of this universal Pet ever published. For less than the cost of a common Canary, it discloses all the secrets of a long life of the most attentive observation. The Nightingale, Blackcap, Skylark, Woodlark, &c., will follow shortly.

Groombridge & Sons, 5, Paternoster Row, London.

CREATLY REDUCED IN PRICE.

PAXTON'S (Sir J.) MAGAZINE OF BOTANY and Flowering Plants. A complete set of this elegant and valuable work from its commencement, embellished with upwards of 700 splendid engravings, beautifully coloured from nature, 16 large vols., royal 8vo. Half morocco, gilt leaves, new, price only 14*l.* 14*s.*—Published at 28*l.* 15*s.*

The advertiser having purchased, on favourable terms, from the proprietors, the few remaining copies of the above beautiful and esteemed work, begs to call the attention of the public to its present reduced price. As the number for sale is very small, early application is desirable.

The merits of this work are so well known that it seems only necessary to call attention to the fact of its containing articles from the first writers on Botany, Floriculture, Horticulture, Arboriculture, Landscape Gardening, Natural Science, Rural Affairs, and every other subject connected directly or indirectly with the vegetable creation.

G. Willis, Great Piazza, Covent Garden.

Now publishing, Part V., containing the genus Epidendrum, with nine large and beautifully coloured plates, price 5*s.*

ILLUSTRATIONS of ORCHIDACEOUS PLANTS, comprising figures of the most interesting and beautiful Genera, Popular Descriptions of all the Cultivated Species, and Directions for their Cultivation. Edited by T. Moore, F.L.S., Curator of the Botanic Garden, Chelsea.

Part I. Genus Stanhopea. Part II. The genus Odontoglossum. Part III. The genera Coryanthes and Sarcopodium. Part IV. The genus Vanda. Each containing five large and beautiful plates, rice 3*s.* 6*d.* per part.

"The genera in this work will be published nearly in the order in which they occur in Dr. Lindley's 'Folia Orchidacea;' so that the book may be considered as exhibiting illustrations of that important publication."—*Hooker's Journal of Botany, Jan.* 1854.

London: G. Willis, Great Piazza, Covent Garden.

ON MARRIAGE.

Just published (to be had free, by enclosing 1*s.* or Twelve Postage Stamps, to Mr. Watson, Clerical Agent, Robert Street, Adelphi, London).

MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

Just published, New Edition, price 1*s.*; or, by post, for 1*s.* 6*d.*

THE SCIENCE OF LIFE; Or, How to Live, and What to Live For. With ample Rules for Diet, Regimen, and Self-Management; together with Instructions for securing perfect health, longevity, and that sterling state of happiness only attainable through the judicious observance of a well-regulated course of life. By a Physician.

Also, by the same Author, price 2*s.* 6*d.*; by post, 3*s.* 6*d.*,

A MEDICAL TREATISE ON NERVOUS DEBILITY AND CONSTITUTIONAL WEAKNESS, with Practical Observations, illustrated with Anatomical Plates, on Health and Disease.

This work, emanating from a qualified Member of the medical profession, the result of many years' practical experience, is addressed to the numerous classes of persons who suffer from the various disorders acquired in early life. In its pages will be found the causes which lead to their occurrence, the symptoms which indicate their presence, and the means to be adopted for their removal.

London: James Gilbert, 49, Paternoster Row; Hannay, 63, Oxford Street, Mann, 39, Cornhill; and all Booksellers.

CRYSTAL PALACE, 1854.

These Books, written in a popular style, with a strictly instructive and educational aim, are to be published separately at a very low price, in order to bring them within the reach of all visitors.

Advertisements for one or all of these publications will be received, from this date, by Messrs. Bradbury and Evans, Printers and Publishers to the Crystal Palace Company, at their Office, 11, Bouverie Street, Fleet Street, where all necessary information relating to these works may be obtained.

POPULAR WORKS ON BOTANY BY DR. LINDLEY.

SCHOOL BOTANY; or, THE RUDIMENTS OF BOTANICAL SCIENCE.

400 Illustrations. 8vo. Price 5*s.* 6*d.* half-bound.

Bradbury & Evans, 11, Bouverie Street.

Lately Published,

THE ELEMENTS OF BOTANY, Structural and Physiological. With a Glossary of Technical Terms, and numerous Illustrations. 12*s.* cloth.

This completes the series of Elementary Botanical Works by Professor Lindley, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of The Elements of Botany, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12*s.*

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5*s.*

Bradbury & Evans, 11, Bouverie Street.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14*s.*,

MEDICAL AND ŒCONOMICAL BOTANY; or An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'Vegetable Kingdom' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable: firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

Bradbury & Evans, 11, Bouverie Street.

THE HORTICULTURAL JOURNAL and FARM and GARDEN ADVERTISER. (Garden Department by Mr. Glenny.) Every Saturday. Price 2*d.*; Stamped, 3*d.*

Communications and Advertisements to F. Dillon, at the Publishing Office, 14, York Street, Covent Garden, London.

DEPARTMENT OF SCIENCE AND ART, 10th May, 1854.

HANTS.

WANTED, a FARM, of about 100 Acres, with comfortable House and suitable Out-buildings, in the neighbourhood of Andover, Winchester, Basingstoke, Alresford, or thereabouts.—Address W. F., 45, George Street, Ryde, Isle of Wight.

OVERTON, HANTS.

TO BE LET, for a Term of Years, COURT FARM, 500 Acres, subject to Tithe Commutation Rent Charge. Near to the celebrated Annual Sheep Fair in Overton, and within a quarter of a mile from a Railway Station to London and the West of England. It consists of Arable, Water Meadow, and Pasture, and is well known as a sound Stock and Corn Farm. —Tenders for the same, stating amount of yearly Rent, to be forwarded to LAMB, BROOKS & Co., Solicitors, Basingstoke, Hants, on or before the 14th day of June next.

TO GENTLEMEN'S GARDENERS.
VILLAGE INN, WITH 10 ACRES OF LAND.

TO BE LET, a VILLAGE INN, situated near Great Yarmouth, with large Garden and pretty Grounds (2½ acres), besides Arable and Meadow Land, &c. (7½ acres). The House, which a few years ago was a gentleman's residence, is capacious and well arranged, and in excellent repair, with Stables, Coach-house, Sheds, &c. Possession at Michaelmas next. The above is eminently adapted for a gentleman's gardener desirous of retiring from private service, with a small capital. Unexceptionable references required.—Apply to the Rev. T. G. F. HOWES, Bolton Rectory, Great Yarmouth, who desires it to be understood that applications which remain unanswered are declined.

TO BE LET, a good DWELLING HOUSE and NURSERY GARDEN, with Greenhouses, and stocked with the best kinds of Plants, Shrubs, and Fruit Trees, to be taken at a valuation. Immediate possession. Rent reduced from 65*l.* to 40*l.* per annum.—Apply to WILLIAM HARRIS, Gardener, 23, Montpellier Walk, Cheltenham.

TO BE SOLD, THREE GREENHOUSES, and PLANTS to be taken at a valuation or private contract, with sundry other useful articles—Frames, Pit Tools, and Mould; with House and Fixtures, 28*l.* a year, with three years' agreement.—For further particulars apply at 6, Alpha Road, Regent's Park, London.

TO BE LET, a FLOUR MILL, worked by Steam, driving Five Pair of Stones, newly built, upon the most approved principle of machinery, situate about 20 miles from London, close to a Railway Station, and adjoining a Canal.—Further particulars of Messrs. REE and SON, Estate Agents, Ware, Herts.

TO PIG AND CHICKEN FEEDERS.—Good Greaves may be had at 10*l.* per ton, upon application to TAYLOR & PEARS, 8, George Yard, Lombard Street, City.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

CHICKENS, POULTRY AND EGGS, to be disposed of by an Amateur.—First-rate Brahma Pootras, Silver, Cinnamon, Lemon, White, and Black Cochins, pure White Poland and Silver Pencilled ditto, Guinea Fowls, Dorking and Aylesbury Ducks, and some very curious Silk Fowls; splendid large young Grey Turkeys (Cambridgeshire), also pure Black Norfolk, White and Buff, all still laying. Some Hens with broods of young Chickens; of these birds, also February Chickens of first-rate Brahmas, Grouse, Lemon and White Cochins. Several sittings of the Eggs of these first-rate birds, which may be strictly relied upon as good in every way.—To be had on application to M. M. M., care of Mr. W. HAWES, Poulterer, 4, Wade's Place, Hackney Road.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

EGGS FOR SITTING, of the Choicest Varieties.—Most of the Birds have taken Prizes at Winchester, Southampton, Surrey Gardens, and Salisbury Exhibitions. White and Black Cochins, White Polands, and Ptarmigans, 21*s.* per dozen; Pure Buff Cochins, 15*s.* per dozen. Post-office Orders payable to FREDERICK FLIGHT, 72, High Street, Winchester.

EGGS AND EARLY CHICKENS.—Brahma Pootra, Dorking, White-faced Spanish, Cochin China (white and buff), White Spanish (Andalusian), Hamburghs, and Bantams; all from prize and selected Birds.—Apply to Mr. SAUNDERS, Cowes, Isle of Wight.

DORKING EGGS, from the produce of Prize Birds, at 7*s.* 6*d.* the setting; Chickens 10 weeks old, from above, 10*s.* the pair.—Address W. DINGLEES, Sand Fields, Charlton Pershore, Worcestershire.

Sales by Auction.

CLAPHAM NURSERIES.
THE STOCK OF PLANTS OF THE LATE MR. JOSH. FAIRBAIRN.

MR. J. C. STEVENS is instructed by the Administrators to announce for Sale by Auction, on the Premises, on MONDAY, 22d; TUESDAY, 23d; and THURSDAY, 25th May, at 12 for 1 o'clock, without reserve, the first portion of the valuable Stock of Plants at the above Nurseries; it includes the Collection of Heaths, for which this establishment has been so long celebrated; fine specimens of Azaleas, Aphelexis, Epacris, and a general selection of Greenhouse Plants, all of which are cultivated in the best possible manner, and are in excellent health. They will be lotted to suit the Trade and private buyers. —May be viewed on Friday and Saturday before the Sale, and Catalogues had on the premises, and of Mr. J. C. STEVENS, 38, King Street Covent Garden; if for the country, by enclosing four postage stamps

ORCHIDS—FROM THE BRAZILS.

MR. J. C. STEVENS begs to announce that he is instructed by Mr. De Jonghe, of Brussels, to announce for Sale, on an early day, which will be named in the next number of the *Gardeners' Chronicle*, a CONSIGNMENT OF ORCHIDS received per last mail steamer, from his collector in the Brazils, including three species of Burlingtonia (two new), five or six species of Cattleya, amongst them C. Leopoldi, and new Coryanthes, Epidendrums, Oncidiums, and other novelties from the Provinces of St. Paul and St. Catherina.

Important Sale by Auction of the whole of the remaining copies of that splendid national work, known as "FINDEN'S ROYAL GALLERY OF BRITISH ART," THE ENGRAVED PLATES OF WHICH WILL BE DESTROYED during the progress of the sale, and in the presence of the purchasers.

SOUTHGATE AND BARRETT have received instructions from Mr. HOGARTH of the Haymarket, to sell by Public Auction at their Fine Art and Book Auction Rooms, 22, Fleet Street, London, on WEDNESDAY Evening, June 7th, and following Evenings, the whole of the remaining copies of the very celebrated work, known as FINDEN'S ROYAL GALLERY OF BRITISH ART, consisting of a limited number of artists' and other choice proofs, and the print impressions, which are all in an exceedingly fine state. The work consists of 48 plates, the whole of which are engraved in line by the most eminent men in that branch of art, and the pictures selected will at once show that the great artists—Turner, Eastlake, Landseer, Stanfield, Webster, Roberts, Wilkie, Maclise, Mulready, and more than thirty other British Masters, are represented by the works which established and upheld them in public favour, and by themes which appeal to universal sympathy and happiest affections, or which delineate the peculiar glories of our country, and commemorate its worthiest and most honourable achievements. The attention of the public is also particularly directed to the fact that all the engraved plates from which the impressions now offered have been taken, will be destroyed in the presence of the purchasers, at the time of sale. By thus securing the market from being supplied with inferior impressions at a future time, and at a cheaper rate, the value of the existing stock will be increased, and it will become the interest of all who wish to possess copies of these eminent works of art, at a reduced price, to purchase them at this sale, which will be the only opportunity of obtaining them. Under these circumstances, therefore, SOUTHGATE and BARRETT presume to demand for this sale the attention of all lovers of art—the amateur, the artist, and the public;—believing that no opportunity has ever offered so happily calculated to promote taste and to extend knowledge, while ministering to the purest and best enjoyments which the artist conveys to the hearts and homes of all who covet intellectual pleasures. Frame Copies of the work can be seen at Mr. Hogarth's, 5, Haymarket; Messrs. Lloyd, Brothers, and Co., 22, Ludgate Hill; and at the Auctioneers, 22, Fleet Street, by whom all communications and commissions will be promptly and faithfully attended to. *** Catalogues of the entire sale will be forwarded on receipt of 12 postage-stamps.

Sale by Auction of the Stocks of extremely Valuable Modern Engravings, the engraved plates of which will be destroyed in the presence of the purchasers at the time of sale.

SOUTHGATE and BARRETT beg to announce that they will include in their Sale by Auction of "FINDEN'S ROYAL GALLERY," and other valuable Works of Art of a similar character, to take place at their Fine Art and Book Auction Rooms, 22, Fleet Street, London, on Wednesday Evening, June 7th, and seventeen following Evenings (Saturdays and Sundays excepted), the whole of the STOCKS OF PROOFS AND PRINTS of the following highly important engravings, published by Mr. HOGARTH and Messrs. LLOYD and Co.:— "Ehrenbreitstein," painted by J. M. W. Turner, R.A., engraved by John Pye. "Ecce Homo," from the picture by Correggio, engraved by G. T. Doo. "The Dame School," painted by T. Webster, R.A., engraved by L. Stocks. "Eton Montem," two views illustrative of, from pictures by Evans of Eaton, engraved by Charles Lewis. "Portrait of Mrs. Elizabeth Fry," engraved by Samuel Cousins, A.R.A., from a picture by George Richmond. "Portraits of Eminent Persons," by George Richmond and C. Baugniet. "Portrait of W. C. Macready, Esq., as Werner," painted by D. Maclise, R.A., engraved by Sharpe. Flowers of German Art, a series of 20 plates by the most eminent engravers. Cranstone's Fugitive Etchings, 17 plates. Turner and Girtin's River Scenery, 30 Plates. "Cottage Piety," painted by Thomas Faed, engraved by Henry Lemon (unpublished). "See Saw," painted by T. Webster, R.A., engraved by Holl (unpublished). "Village Pastor," painted by W. P. Frith, R.A., engraved by Holl. "The Immaculate Conception," painted by Guido, engraved in line by W. H. Watt. "Harvey demonstrating to Charles the First his Theory of the Circulation of the Blood," painted by Hannah, engraved by Lemon. "The Origin of Music," printed by Selous, engraved by Wass. "The First Step," painted by Faed, engraved by Sharpe. "The Prize Cartoons," published by Messrs. Longmans and Co. And numerous other highly interesting and valuable works of Art. All the engraved plates of the above-mentioned engravings will be destroyed in the presence of the purchasers at the time of sale, which will thereby secure to the purchasers the same advantages as are mentioned in the advertisement given above, of the sale of the remaining copies of "Finden's Royal Gallery." Framed impressions of each of the plates can be seen at Mr. Hogarth's, 5, Haymarket; of Messrs. Lloyd, Brothers, and Co., 22, Ludgate Hill; and at the Auctioneers, 22, Fleet Street, by whom all communications and commissions will be promptly and faithfully attended to. *** Catalogues of the entire sale will be forwarded on receipt of 12 postage-stamps.

The very extensive, highly important, and extremely choice Stock of Modern English and Foreign Engravings, Water-Colour Drawings, and expensive Books of Prints of Mr. Hogarth of the Haymarket.

SOUTHGATE and BARRETT will Sell by Auction at their Fine Art and Book Auction Rooms, 22, Fleet Street, on WEDNESDAY Evening, June 7th, and seventeen following Evenings (Saturdays and Sundays excepted), in the same sale as the "FINDEN'S ROYAL GALLERY OF BRITISH ART," this extremely valuable and highly interesting Stock. Amongst the engravings will be found in the best states of artists' and other choice proofs, nearly all the popular plates that have been published during the last quarter of a century; also an Important Collection of Foreign Line Engravings in the best states; a large variety of Portraits and other subjects after Sir Joshua Reynolds, some very rare; an extensive series of Prints by Hogarth, in early proofs and with curious variations; a most complete series of artists' proofs of the Works of George Cruikshank, including nearly all his early productions, many unique; a number of scarce Old Prints, and a series in fine states by Sir Robert Strange. The Stock is peculiarly rich in the Works of J. M. W. Turner, R.A., and comprises artists' proofs and the choicest states of all his important productions, and matchless copies of the England and Wales and Southern Coast. The Collection of High-class Water-Colour Drawings consists of examples of the most eminent artists, (particularly some magnificent specimens by J. M. W. Turner), as well as a great variety of the Early English School, and some by the Ancient Masters; also a most interesting Collection by Members of the Sketching Society. Of the Modern School are examples by—Absolon, Austin, Barrett, Cattermole, Collins, C. Fielding, Holland, Hunt, E. Landseer, Leslie, J. Lewis, Liverseege, Maclise, Muller, Nesfield, Prout, F. Tayler, Uwins, Webster, Wilkie. Catalogues of the entire sale will be forwarded on receipt of 12 postage stamps, and all communications and commissions promptly and faithfully ttended to. 22, Fleet Street, London.

TO TULIP FANCIERS AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by Mr. Staines to sell by Auction, on the premises, Culley's Nursery, near the New Globe Tavern, Bow Road, Middlesex, on MONDAY, May 22d, at 2 o'clock, his superb collection of TULIPS, including about 400 varieties, and most of the choicest in cultivation, together with Seedlings of his own raising, not to be found in many other collections.—May be viewed three days prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO TULIP FANCIERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Goldham to submit to public competition, by Auction, on the premises, Hynder Cottage, Merton Lane, Mitcham, Surrey, on FRIDAY, May 26th, at 1 o'clock, a portion of his costly and unrivalled collection of TULIPS. No comment on this magnificent stock will be equal to an inspection of its striking beauties, for which an opportunity is now offered to the Amateur Florist, &c. New Flowers, Breeders, and Seedlings of Mr. Goldham's raising, the result of more than 30 years' successful cultivation and competition. May be viewed two days prior to the sale; Catalogues may be obtained, 1*s.* each (returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex. N.B. Those gentlemen who may desire to view Mr. Goldham's Tulips, grown at Forest Hill, Sydenham, Kent, the parent bulbs of those about to be sold by Auction, at Mitcham, Surrey, are informed that the same may be seen on the Monday and Wednesday previous to the day Sale, between the hours of 11 and 6 o'clock.

BOW.—10,000 GREENHOUSE AND BEDDING PLANTS.

MESSRS. PROTHEROE AND MORRIS will submit to an unreserved sale by Auction, on the premises, Mile-end Nursery, Bow Road, Bromley, Middlesex, near the Bow Railway Station, on TUESDAY, May 23d, at 12 o'clock, a collection of GREENHOUSE PLANTS, consisting of fine Show and Scarlet Geraniums, Genista, Cactus, Hydrangeas, Myrtles, Calla, Fuchsias, Verbenas, Heliotropium, Salvia, Calceolaria, Petunia, Mimulus, Nierembergia, Lobelia, Erinus, Phlox, Cuphea, Ageratum, Gaillardia, Chrysanthemums. Intermediate Stocks, Tropæolum canariensis, Cobæa, &c.—May be viewed three days prior to the sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY, May 24, at 12 o'clock, a first-rate collection of Dahlias, Fuchsias, Verbenas, Geraniums, and other plants in bloom, with a large assortment of plants for bedding. On view the morning of sale.—Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS beg to intimate that they have received instructions from the executors of the late Mr. Samuel Dark, deceased, to sell by Auction, without reserve, on the premises, North Street, East India Road, Poplar, on THURSDAY, May 25th, at 2 o'clock, a very rare and costly collection of TULIPS, the study of 40 years of the deceased's life, whose judgment and taste were universally admitted; also a choice collection of Ranunculuses, Rose trees, Gladiolus, Chrysanthemums, Pinks, Carnations, Lilies, &c.; together with the Iron-work Fittings, Netting, Canvas, Fencing, &c.—May be viewed the morning of Sale; Catalogues had of Mr. Year, Park Road, Old Ford; at the White Swan, West Ham; City of Canton, East India Road, Poplar; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AMATEURS, ETC.

MR. WILMER will sell by Auction, on THURSDAY, May 25, at 1 o'clock, without reserve, a collection of TULIPS, the property of Mr. C. Woolnough, now growing in the garden Grounds of Mr. Selby, New North Road, Hoxton; also the Tulip Stage, with Iron Roof, Top Cloth and Rollers, Boxes, Irons, &c. Among the flowers are Shylock, General Jackson, Pompe Funebre, Man of Kent, Archer's Unique, Lucullus, Polyphemus, Mehemet Ali, Marshal Soult, Coronation, Walker's and Dixon's Dukes of Devonshire, Franklin's Superb, Glory, Invincible, Lord Brougham, Ariadne, Victory, and Favourite; Rose Camuze, Camuze de Craix, Greig's Rose, Bacchus, Emily, Goldham's Mary and Maria, Reine d'Espagne, Violet's Quarto, Precoce, Cook, Louis XVI., Godet Parfait, La Vandyke, Brulante Ecletante, Osiris, Timandra, Duc de Bordeaux, &c.—May be viewed two days previous and morning of sale. Catalogue on application to Mr. Tebbutt, Hoxton Nursery, New North Road; Mr. Tons, Swan Inn, West Ham; C. Woolnough, 6, Bateman's Row, Shoreditch; and of the Auctioneer, Sunbury, Middlesex.

Desirable Freehold Farm for investment or occupation, 4 miles from the Higham Station on the Newmarket and Bury St. Edmund's Railway.

MESSRS. DAVIES AND VIGERS are directed by the Executors of the late Stephen Spencer, Esq., to SELL BY AUCTION, at the Mart, on TUESDAY, June 6, at twelve o'clock, the EASTYWOOD FARM, situate in the parish of Wickham-brook, Suffolk, eight miles from Newmarket and Bury St. Edmund's, on the high road between these important market towns. It comprises 251*a.* 1*r.* 0*p.* of level arable, pasture, and wood land, in convenient enclosures, and lying well for game, with a commodious cottage residence, pleasantly and conveniently situate beside the high road and in the centre of the farm, suitable farm buildings, and six labourers' tenements. The ponds afford fishing, and the situation is favourable for all kinds of sporting. The late owner occupied the farm to the time of his decease, and made it most desirable for occupation. It is now farmed by the executor, who is willing to rent it, or immediate possession will be given. The estate may be viewed on application, and particulars and conditions of sale, with plans, may be had of Mr. Cawston Stutter, at the farm; of Wm. Salmon, Esq., solicitor; and at the Old Bell Inn, Bury St. Edmund's; at the Rutland Arms, Newmarket; at the Mart; and at the Auctioneers' Offices, 3, Frederick's Place, Old Jewry.

CHOICE AND VALUABLE COLLECTION OF TULIPS.

TO BE SOLD by Auction, without the least reserve, on the premises, Cooper's Lane, Leyton (near the Church) on MONDAY, May 29, at 1 o'clock, comprising among Bizarres Marcellus, Strong's King, Pompe Funebre, Everard, Apelles, Vivid, Sphynx, Willison's King, Norman's Royal Albert, Achilles, Sir E. Knatchbull, Sir George Whitmore, Alexander's Monarch, Emperor, Rembrandt, Charles Baron, Coftan, Charles Jeffrey Kossuth, Paganini, Waterston's Midas, Grisewood's Grace Darling, Morning Star, Headley's King Richard. The Byblœmens comprise Pandora, Salvator Rosa, Rutley's Queen, Brown's Magnificent, Duke of Northumberland, Dixon's Democrat, Parmegiano, Byzantium, Nora Creina, Lord Bloomfield, Thalia, Louis XVI., Godet Parfait, Patty, Zuill's George Glenny, Flora, Father Gavazzi, Reid's Duke of Argyll, Thomas Maxwell, Lord J. Russell, Sir H. Smith, Wylie's Rob. Wylie, &c. Among the Roses are Rose Lac, Sans Égale, Camuse de Craix, Brulant Ecletant, Dixon's Arlette, Bion, Alexander's Gem, Jenny Lind, Jeffrey's Elizabeth, Maid of Honour, Village Maid, Flora M'Donald, Mary Lamb, Miss O'Neil, Mrs. Zuill, John Waterston, Munroe's Mount Hecla, &c.; also many new flowers only in this collection the property of Mr. James Alexander.—May be viewe two days prior to Sale; Catalogues had at the Mart; of Messrs Dawe, Cottrell, and Benham, Seedsmen, Moorgate Street; White Swan, West Ham; on the premises; and of Mr. Henry Alexander, Auctioneer, Shacklewell.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

THE "ECONOMICAL" MANURE,

SO CALLED, BECAUSE

1¼ to 1½ cwt. per Acre, costing 15s. to 18s., is ample, and fully equal to 3 cwt. of the best Peruvian Guano; thus saving at least 50 per cent., besides Carriage, &c.

THIS quantity is quite sufficient, and must on no account be exceeded, as injury instead of benefit arises if more is used, the Manure having been purposely manufactured in a highly concentrated state. It will be seen from the Testimonials below—

1. That "at a cost of 12s. per acre the Turnips were a most extraordinary crop."
2. With 1½ cwt. per acre they (the Turnips) "are equally as good as where I applied 3½ cwt. of superphosphate of lime per acre."
3. An expense of 23s. per Scotch acre for this manure produced Turnips "equally as good as those growing in the same field with 6 cwt. per Scotch acre of guano, at 10s. 6d. per cwt.;" making three guineas against 23s.
4. "I can see little difference in the two, where 1 cwt. per acre of this Manure was used against 3 cwt. of guano."
5. 7½ cwt. to 6 acres gave "a splendid crop of Turnips" from the Economical Manure alone, which cost 15s. per acre.
6. "The effect has been surprising on Turnips."
7. "Where I applied it the Turnips are much finer than usual."
8. "The fly has not taken them (the Turnips) so much as where guano was used."
9. On Mangold Wurzel, 1 cwt. per acre produced "the best crop I ever have grown."
10. In 1½ cwt. per acre against 3 cwt. of superphosphate, "the 'Economical' was superior."
11. Where guano and the Economical Manure were used, "it is impossible to tell one from the other."
12. "My Swedish Turnips are capital—the best, people tell me, in the whole parish."

N.B.—The following few Testimonials from the Company's pamphlets are given, because they are considered to embrace almost all parts of the United Kingdom, and although they refer only to the use of the Manure for Turnips and Root Crops, it has produced the most wonderful results last year on every kind of crop, and on all soils, far surpassing the expectations of the purchasers; and no one reading the Company's pamphlet can doubt its being by far the cheapest of all manures, as in fair comparative trials with guano, dung, and other long recognised fertilisers, it will be seen the "ECONOMICAL" was superior; that it is most valuable for fruit trees, shrubs, and garden purposes, and produces the most astonishing effects upon manure heaps, applied in solution, decomposing in 15 days all vegetable matter, peat included, and that it is a perfect deodoriser for liquid manure, besides enhancing its fertilising properties.

It is a chemical compound in a highly concentrated state, providing the plants with a large proportion of ammonia, which it has the property of attracting from the atmosphere and fixing in the soil, as well as the carbonic acid—two of the most energetic agents of vegetation. It is sold in a dry powdered state, and is the result of many years' labour of an eminent Foreign Agriculturist, the Director of the Government Schools of Agriculture in his own country, and of high reputation as a chemist. It is patented, and is one of the most useful and greatest discoveries of the day.

PRICE 12*l.* PER TON, Packages included, and delivered free on Rail or Wharf in London.

A pamphlet, containing further Testimonials (more cannot be given here), including those from France, Belgium, and Spain, with directions for use, samples, and all particulars, to be had at the Offices of the British Economical Manure Company, 10, Mark Lane, London; or sent gratis on applying to BENJAMIN COVENEY, Manager.

TESTIMONIALS.

Mungalhead, Falkirk, Stirlingshire, N. B., Oct. 14, 1853.
I used the Economical Manure as follows:—I weighed it out at the rate of 210 lbs. per Scotch acre (a Scotch acre is about one acre and one-fifth English), bruised it very small, then properly mixed it with, say twice its bulk of light earth, the land a good loam, cleansed and ready for drilling; the mixture was then sown broadcast, the land drilled up double; we then sowed the Turnip seed, which brairded well, and they are now equally as good as those growing in the same field sown with 6 cwt. of guano per acre, at 10s. 6d. per cwt. What I would suggest is, if you think proper, that you insert an advertisement in our local papers, and refer to the Turnips now growing at Mungalhead, for inspection of the merits of the Manure. I think any one seeing its effects should be satisfied. WM. MOBBISON.

Cublington Madley, Hereford, Jan. 2, 1854.
I used the Economical Manure for common Turnips, planted the first week in June; it was sown broadcast on the flat, and afterwards ridged up 20 inches wide. I put about 1½ cwt. per acre, and on the other parts of the field 3 cwt. of superphosphate, and I am of opinion, with most persons who have seen the crop (which is a very good one), that the Economical is superior to the phosphate. GEORGE PYE.

Little Genoch, by Glenluce, Wigtownshire, N.B., Dec. 9th, 1853.
I applied about 4 cwt. of Economical Manure in a liquid state to about 60 cart-loads of farm-yard dung, which I used along with a small quantity of bones to my Turnip crop, and found the crop to be superior to that to which I had applied guano and bones. The Turnips are all grown in the same field alongside of each other. JAMES M'MASTER.

Carlisle, Dec. 5, 1853.
Mr. John Graham, farmer, Beaumont, near Carlisle, has a splendid crop of Turnips, grown entirely from the Economical Manure. He used 7½ cwt. to 6 acres, mixed with three parts earth to one part Manure. The mixture lay three days before it was put upon the ground. THOMAS BLACKLOCK.

Soham, Cambridgeshire, Oct. 4, 1853.
I used your Manure for Mangold Wurzel, broadcast; it was about the first week in May. I put about 1 cwt. per acre mixed with earth. I have the best crop I ever have grown, they looked so strong and growing all through the season. WM. C. PEEK.

Albion Foundry and Iron Works, Rugeley, Staffordshire, July 1, 1853.
I got a friend to test some on a Turnip crop against guano, and he says that his Turnips look best in that part of the field where he sowed the Economical Manure, and that the fly has not taken them so much as those where guano was used. He is a person well known in the neighbourhood; and when this becomes known I have no doubt I shall succeed in selling a good quantity. THOMAS HATFIELD.

Alwalton Lodge, Peterborough, Northamptonshire, Nov. 30, 1853.
Relative to the Economical Manure, I have to observe that I have not noticed it sufficiently to speak definitely as to the attendant results. The season was unfavourable, and I did not get the whole I ordered applied to my Turnips; but where I did apply it they are much finer than usual. The remaining portion I have sown broadcast on Wheat. I am so well satisfied as to its utility, that I shall be a customer on a rather larger scale another year. JOHN POLES.

Cairnsmore, Newton Stewart, Wigtownshire, N.B., Oct. 21, 1853.
I used your Manure for Turnips. I sowed at about 1 cwt. per acre, together with about 20 bushels of bones, and about 3 cwt. of guano, with the same quantity of bones in the same field, and I can see little or no difference between the two.
JAMES CARFRAE, Farm Manager to James Stewart, Esq.

Bodrhyddan, Denbighshire, N.W., Oct. 13, 1853.
I used your Manure for Turnips about the 20th of May. I applied 1½ cwt. per acre, together with about 2 tons of farm-yard manure. I likewise applied on every 20 alternate rows 2 cwt. of Peruvian guano, together with the above-mentioned quantity of farm-yard manure. The result in both cases is an excellent crop, and as near equal as I can judge. I may add, the land is a mixture of gravel and sand. WILLIAM BELL.

Cleves Cross, Durham, Oct 11, 1853.
I have used the Economical Manure on nothing except Turnips. I sowed about 1½ cwt. per acre alone, and about 2½ cwt. of Peruvian guano in the same field, and I cannot perceive much difference in the two. The soil is limestone gravel.
THOMAS THOMPSON.

Stoke Golding, Leicestershire, Dec. 10, 1853.
I tried the Economical Manure for Turnips, and the effect has been surprising. I manured some land equally with rotten dung, upon one part of which I put the Economical Manure. Where I did so, the Turnips are very large, while on that part which received the dung I have scarcely any Turnips at all. I consider the Manure most valuable. My crop will well repay for the extra outlay in the Economical Manure. S. LAW.

Shelford Manor, Bingham, Notts, Nov. 8, 1853.
Through the recommendation of Mr. E. S. Gisborne, Land Agent, Derby, I was induced to try the Economical Manure on a Turnip crop; and, for the purpose of giving it a fair trial, I selected a field of 30 acres, in a good state of cultivation and equal quality. This field I divided into three lots; one third was dressed with the Economical Manure, at the rate of 1 cwt. per acre; one third with kiln-dust of equal value; and one third with soot of equal value. I now have the pleasure of stating that the Turnips on the portion dressed with the Economical Manure are a most extraordinary crop, and surpass in size and vigour in a remarkable degree those on the land dressed with kiln-dust and soot. JOHN HASSALL,
Agent to the Right Hon. the Earl of Chesterfield.

Plascoch, Ruthin, Denbighshire, N. W., November 2, 1853.
I sowed 1½ cwt. of the Economical Manure to the acre, for Turnips on the flat, afterwards ridged up for sowing; but before it was covered the weather changed, and it lay exposed I dare say for a week, which no doubt would have a very injurious effect upon it. The Turnips, on some patches of it, are very strong; I have no doubt, had I been fortunate in its application, it would have answered well. I have a very good opinion of it.
FRANCIS CLARKE.

North Walsham, Norfolk, October 26, 1853.
I used your Economical Manure upon half an acre of land for Turnips (1 cwt. of it), and my Swedish Turnips are capital—the best, people tell me, in the whole parish. EDWARD MEADE.

Penkridge, Staffordshire, December 8, 1853.
Although the season has been very unfavourable for the trial of manures, I am quite satisfied that the Economical Manure is a valuable manure. The roots of the Turnips grown by it are equal to any I have grown this season with artificial manure.
CHARLES STUBBS.

Barley, near Royston, Herts, December 16, 1853.
The Economical Manure I ordered did not arrive in time to be used upon Swedish Turnips; I therefore used it upon Greentops. The way I tested it was this: the 12 cwt. was mixed with 80 bushels of cinder-ashes, and 4 quarters of malt-chimes, and that was put upon nearly 8 acres, making the expense, including carriage, &c., about 29s. per acre. There was no other manure used, except some burnt ashes from the Grass, &c., round the field; and there is a fine crop of Turnips. There is no doubt about the manure being good, as the difference of the deposit between the up and down-hill works plainly shows its utility.
T. C. WALBY.

West Bilney, Swaffham, Norfolk, October 13, 1853.
I applied your Economical Manure as a top dressing for Barley, at the rate of 1½ cwt. per acre, mixed with 20 bushels of burnt earth, and sown broadcast. I was quite satisfied with the result. I likewise drilled the same quantity for Turnips and find they are equally good as where I applied 3½ cwt. of superphosphate of lime per acre, at a cost of 1*l.* 1s.
R. H. WALPOLE.

Chilvers Coton, Warwickshire, Dec. 12, 1853.
I beg to say that the Economical Manure has given me great satisfaction. I used some for Turnips, and the result has been most satisfactory. I have no doubt it will be in great use here as soon as its good qualities become more generally known.
JAMES HANKINSON.

Hafod-y-Green, near Denbigh, N. W., Nov. 7, 1853.
The following is the manner in which I applied the Economical Manure:—A portion of a Turnip field was manured with about 20 tons per acre of the best stable and cattle dung, made during the winter; upon the remainder I put about the same quantity of inferior stuff, such as road-scrapings, cinder-ashes, &c.; to this I added about 1 cwt. of your Manure to the acre, hoping to equalise the crop; and at this time there is no difference to be seen in the field. I therefore consider your Manure made up the deficiency. The soil is a cold wet clay; but the crop is quite equal to my expectations. C. H. (Bailiff to J. Blew, Esq.)

Antingham, near North Walsham, Norfolk, Oct. 3, 1853.
I feel satisfied of the utility of your Economical Manure, in promoting the growth of Turnips. HENRY WRIGHT.

Lyde, Herefordshire, January 14, 1854.
I used one barrel of the Economical Manure for common Turnips, planted in July: it was sown broadcast on the flat, and afterwards ridged up 20 inches wide; about 1½ cwt. per acre. I perceived very little good for the first six weeks; afterwards the Turnips progressed very fast. But the land was not drained, and was very wet; yet I find them a fair crop. I have no doubt if the land had been drained I should have had double the quantity.
RICHARD EDWARDS.

Cosby Lodge, Lutterworth, Leicestershire, Dec. 15, 1853.
I used your Economical Manure at the rate of 1½ cwt. per acre, to a crop of Swede Turnips. I applied it broadcast, and ridged the soil up afterwards with a small quantity of farm-yard manure. I am perfectly satisfied with the result, having a very good crop. Should I live till next year, I intend using it again.
JOHN DEAYCOTT.

Witton, North Walsham, Norfolk, November 1, 1853.
I used your Manure against two others, on the 30th of June, for Turnips, and have a splendid crop, beating both the others.
THOMAS CUBITT.

Moorgate House, East Retford, Notts, February 14, 1854.
I have been over to Mr. Johnson's, a large farmer in this neighbourhood, and find that in his Turnips, where guano and the Economical Manure were used, to the same amount in money, it was impossible to tell one from the other; in fact, neither he nor I could tell which was which, the crop from both being extraordinarily good. W. BOWER.

The Company have the satisfaction to state, that they are in receipt of most favourable reports of the effect of the Manure this year; two or three are subjoined:—

Cambridge, May 15, 1854.
I applied some of your Economical Manure to various crops this spring:—on two different fields of Wheat, a piece of Barley, 2 acres of Clover, and on some Autumn-set Cabbages. All I can say (and as it is the first year of my using the article), all I ought to say, is, that so far, the improvement in all the crops is most manifest, more especially in the Clover. But even on the Wheat and Barley, although applied invariably where the crop was weakest, its effects are so striking, that a person riding along the road cannot but perceive it. I have used it for Mangold Wurzel, and shall do so for Turnips, but as yet, in the former instance, the Mangold is not up, and therefore nothing can be said of it. It is but fair also to add, that I have applied it to two compost heaps; in reducing Twitch, Cabbage Stalks, and such like, to a useful compound for the land, with layers of horse dung, and with the exception of the windward side of the heaps, where the Couch Grass or Twitch was laid quite on the outside, the heaps, in three weeks, became excellent manure. So far, I have never expended 18s. per acre on any crops, after 40 years' experience, with so much effect. I think the agriculturists to whom I am known will give me credit for not intentionally misleading them. I write only the result of my own experience. You will immediately send me another ton, for my own use, and one for a neighbouring farmer. P.S.—I find 2 heaping bushels per acre of the manure, with the like quantity of ashes, seems to cost about 18s. per acre, and in this manner we have so far used it.
WILLIAM BENNETT.

[This gentleman is the well-known and practical Agriculturist, formerly of Lewsey, Bedfordshire.]

Manea, near Chatteris, Cambridgeshire, May 17.
I beg to inclose an order for 24*l.* 19s., the amount of your account against me for Manure. I should have forwarded this a little earlier, but having used the manure on 12 acres of Hemp, I waited to see if it had any immediate visible effect. I am happy to say I think it has, as the plant is vigorous and strong.
MICHAEL L. SEARS.

Halvergate Mills, Acle, near Norwich, May 18.
I am happy to give you an excellent account of the Manure. Mr. Smith, of Reedham, top-dressed a field of Wheat in the beginning of April, it was very thin and weak; he did not expect a quarter of a crop. The other day he was telling me it was wonderfully improved, and he did not think there was any in the parish looking better: so well satisfied is he with it, that he has given me an order for half a ton more for top-dressing Barley, also an order for a friend of his. You are quite at liberty to advertise this, as you cannot speak too highly of it. I shall require 2 tons instead of 1. JOHN HEWITT.

GOOD AGENTS WANTED.—AN ALLOWANCE TO THE TRADE.

HORTICULTURAL SOCIETY OF LONDON.—The QUEEN having been graciously pleased to name Saturday, June 10, as the day on which her Majesty will open the Crystal Palace, Notice is hereby given that the Meeting of this Society, announced for the same day, will be held on SATURDAY, JUNE 3, instead of Saturday, June 10, as previously intended. All Tickets issued for June 10 will be available for June 3.—21, Regent Street.

VALE OF TAUNTON DEANE HORTICULTURAL AND FLORICULTURAL SOCIETY.—The FIRST EXHIBITION of the above Society will be held in the Vivary Park, Taunton, on WEDNESDAY and THURSDAY, the 21st and 22d days of June next. HANDSOME PRIZES will be awarded to Nurserymen.

The Society have resolved to hold, in conjunction with the same, a GRAND POULTRY EXHIBITION. Upwards of EIGHTY PRIZES will be given. Schedules for both Exhibitions and all further information may be obtained of the Honorary Secretary, Mr. JOHN KINGSBURY, 10, Hammet Street, Taunton, Somersetshire.

CHELTENHAM GREAT EXHIBITION, HORTICULTURAL SECTION.—The days appointed for the British and Foreign Exhibitions are TUESDAY and WEDNESDAY, the 20th and 21st of June, when upwards of £62. will be offered in Prizes. Notice of space required by Exhibitors must be given on or before Tuesday, June 6. *Judges.*—Mr. GORDON, Chiswick; Mr. C. M'INTOSH, Dalkeith Palace; Mr. IVISON, Syon Gardens; Mr. GLENDINNING, Chiswick; Mr. EDWARDS, Wace Cottage, Holloway; Mr. DAVIDSON, Shrubland Park; Mr. KIMP, Rockbier.—THOMAS VOILE, Hon. Secretary; HENRY J. COCHRANE, Secretary.

Committee Room, 128, High Street.

MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.—The Second Exhibition of PLANTS, FLOWERS, FRUITS, and VEGETABLES, will be held at the Society's Gardens, Old Trafford, on Wednesday next, May 31.

Orders for the Admission of Ladies and Strangers may be had from any of the Members, or at the Office of the Secretary, 40, Princes Street, Manchester.

By order of the Council,
May 27, 1854. JOHN SHAW, Secretary.

MR. GEORGE USHER, formerly of South Dalton, if he will communicate with his brother, Mr. J. USHER, of Appleby, will hear something to his advantage.

EXHIBITION OF PELARGONIUMS, ETC.

JOHN DOBSON begs to announce that his Annual Exhibition will take place on THURSDAY next, June 1, when his unrivalled collection of the above will be arranged the same as at the exhibitions at Chiswick. A military band will be in attendance. Admission free, by tickets only, which may be had on application at the Nursery only. Applications enclosing one stamp will be attended to. Trains from Waterloo station to Isleworth a few minutes after every hour.

Woodlands Nursery, Isleworth.

EXHIBITION OF AMERICAN PLANTS AT KNAP HILL NURSERY, WOKING.—The American plants at this Nursery are now in bloom, and may be seen daily gratis. The Knap Hill Nursery is within an hour's ride of London, by South Western Railway to Woking, where all trains stop, and from whence capital conveyances may be obtained.—WATERER & GODFREY, late HOSEA WATERER.

EXHIBITION OF SPECIMEN PLANTS.

J. AND J. FRASER beg to invite the attention of the Nobility and Gentry to an inspection of their fine collection of Specimen CHINESE AZALEAS and other plants, which are now in bloom. The plants are so arranged in various Greenhouses as to have a similar effect to that produced at the Metropolitan Flower Shows. The collection comprises those specimens which have been exhibited so often at the Regent's Park and Chiswick Gardens, at which places they have taken the leading prizes.

The Nursery is about 15 minutes' walk from the Lea Bridge Station on the Eastern Counties Railway. Trains leave London at 9 a.m., 9.30 a.m., 10 a.m., 10.40 a.m., 12.30 a.m., 1.40 p.m., 2.30 p.m., 3.20 p.m., and 4.45 p.m.—Admission Gratis.

Lea Bridge Road, Essex, May 27, 1854.

NEW VARIEGATED GERANIUMS, ATTRACTION AND SILVER KING.

JOHN AND CHARLES LEE are now sending out strong plants of these elegant novelties, which they can recommend as surpassing anything of the kind hitherto introduced.

ATTRACTION has a decided crimson horse-shoe, on a finely variegated foliage, which greatly enhances its beauty. The flowers are light scarlet. Price 10*s.* 6*d.* each.

SILVER KING is of a dwarf free habit, the leaves perfectly flat, with a very broad silver margin; flowers intense scarlet. Price 7*s.* 6*d.* each, or 70*s.* per dozen.

Nursery and Seed Establishment, Hammersmith, near London.

NEW TURNIP SEEDS DIRECT FROM THE GROWERS.

WILLIAM E. RENDLE AND CO. have this season a very superior stock of all kinds of TURNIPS, and they recommend all who are in want of the best varieties to procure their "Farming Price Current and Agricultural Directory," to be had in exchange for six penny stamps.—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

RENDLE'S IMPROVED SWEDE TURNIP.—*The Stock of this excellent Swede has been grown for us this season by R. H. Watson, Esq., Dorsley, near Totnes. It is a most hardy and valuable variety. Price* 1*s.* 6*d. per lb. For further particulars and testimonials of its excellence see* "FARMING PRICE CURRENT," to be procured from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

THE CRUICKSFIELD HYBRID SWEDE.

MESSRS. SUTTON AND SONS, SEED GROWERS, Reading, have much confidence in recommending this new Agricultural Root, both for early and late sowing.

It partakes of the nature of the Kohl Rabi in its extreme hardiness, capability of enduring summer drought, and may be transplanted while young, if required to mend other crops. Sheep prefer it to other Swedes.

The cultivation is the same as common Swedish Turnips. This is the first year of its being offered to the public. Price 5*s.* per pound. Three pounds of seed sufficient per acre.

THE LARGEST AND BEST TURNIP FOR EARLY SOWING.

SUTTON'S LINCOLNSHIRE RED GLOBE TURNIP.—A superior variety, presented to us by Philip Pusey, Esq., being more solid and larger than any other. Price 1*s.* 6*d.* per lb., or 9*s.* per gallon. Carriage free.

From Mr. Albert Edmonds, Steward to Philip Pusey, Esq., November 22d, 1853.

"By the desire of Mr. Pusey, I beg to inform you that he had a very fine crop of the Red Lincolnshire Turnip, weighing 30 *tons* 10 *cwt.* 1 *qr.* 24 *lbs. per acre."*

From Mr. T. Chandler, Liquid Manure Drill Maker, Aldbourne, November 11th, 1853.

"The Lincolnshire Red Turnip seed of which I had from you, has produced the finest crop I ever grew."

JOHN SUTTON AND SONS, Seed Growers, Reading, are receiving many orders daily for this Turnip Seed, with similar remarks to the above, relative to last year's crop. *Orders will be executed in rotation, in strict accordance with priority in our receiving them.*

TURNIP SEEDS! TURNIP SEEDS!

CARRIAGE FREE.

B. PAGE AND CO.'S Genuine Stock, saved from the finest transplanted Bulbs, will, as heretofore, gain the greatest number of Prizes at Root Exhibitions.

SEEDLING VERBENAS.

W. J. EPPS has great confidence in recommending the following Seedlings, raised by Mr. Philpot, of Aldington, being without exception the most distinct and splendid flowers in their class yet offered to the public. The following are the opinion and description given by Mr. Neville, editor of the *Gardeners' Record;* they were exhibited at Ashford open Show, in September last, and received first-class certificates.

No. 1. SULTAN.—Dark velvety maroon; large white eye; petals stout; pip, full size; truss, medium; a beautiful variety.

No. 2. BLUE BELL.—Dark velvety blue, with white eye; truss very large and well formed.

No. 4. INDIAN CHIEF.—Crimson puce, very rich in colour; yellow eye; very attractive.

No. 5. DELICATISSIMA.—Pale lavender, with large primrose eye; very beautiful and novel; petals, stout; pips, well formed; truss, medium.

No. 8. RUFUS.—Plum colour purple; velvety texture; dark disc; with a clear white margin; immense flower and trusser.

No. 20. DISTINCTUS.—Cherry lavender grey disc; distinctly margined with dark crimson purple; fine bold truss and large flowers.

The whole of the above are exceedingly free flowering, and excellent habits — well suited for bedding or other purposes: 12*s.* 6*d.* the collection.

SEEDLING PHLOXES.

These are, without exception, the most lovely things in their way possible; they have been much admired by all who have seen them, and have merited the high opinion of the editors of the leading floricultural works. The following is the description from the *Gardeners' and Farmers' Journal*, Sept. 21st, 1853:—

"SEEDLING PHLOXES.—The collection of Seedling Phloxes received is remarkable for novelty and superiority of form.

No. 1. MARIA.—Rose peach, with white eye.
No. 3. ASTROSANGUINEA.—Fine crimson.
No. 4. DISTINCTUS.—Light purple, white eye.
No. 5. CARMINATA.—Deep rose, white eye.
No. 7. SPLENDENS.—Large lilac, white eye.
No. 8. CONSPICUA.—Very deep rose, white eye."

10*s.* 6*d.* the collection.—Nurseries, Maidstone.

GERANIUMS.

WILLIAM HUSSEY begs to offer the under-named Collection for 14*s.*, fine flowering plants, package included, viz., Cuyp, Emily, Chloe, Lavinia, Constance, Guielma, Magnificent, Belle of the Village, Major Domo, Nectar Cup, Rosamond, Conspicua, Symmetry, Governor, Generalissimo, Fair Maid of Perth, Lalla Rookh, Alonzo, May Queen, Lord Mayor.

Horticultural Gardens, Norwich, May 22, 1854.

CINERARIA SEED.

EDWARD GEORGE HENDERSON & SON, Wellington Nurseries, St. John's Wood, London, are now prepared to forward, by post, newly saved seed of 1854, which, if sown now, will give strong plants for winter flowering. More care than usual has been bestowed in gathering the seeds from the finest named sorts, even the newest varieties sent out last year, and all pale coloured flowers have been destroyed, so that the most brilliant colours may be expected.

N.B.—Orders for the Calceolaria seed can now be booked for sending as soon as ready.

VANDA CŒRULEA.

MESSRS. MAULE AND SONS having received, the two last seasons, from their collector in the district of the Khasia Hills, a good supply of this most beautiful and charming Orchidaceous Plant, which stands unrivalled amongst the family of Vanda, from its abundant blooming, easy culture, great length of flower spike, and large number of blooms, which are of the most brilliant sky blue, lasting a long time in beauty, flowering from September until January, and in every respect is a first-class Plant of the justly admired tribe of Orchidaceous Plants. There is little doubt that this Plant after cultivation will flower at almost every season, as V. suavis, tricolor, &c. They have also received other esteemed kinds from this of Flora's favoured district of India, which they at the same time offer.

ARTHUR HENDERSON AND CO. take the earliest opportunity of informing their friends and the public, that their CATALOGUES No. 3 and No. 6 are now ready and can be had, post free, upon application.

No. 3 contains descriptive lists of Geraniums, Verbenas, Fuchsias, Calceolarias, Cinerarias, Chrysanthemums, &c., amongst which will be found all the best novelties of the season, also the choicest selections from former years.

No. 6 contains descriptive lists of all the newest and best Stove, Greenhouse, and Hardy plants, amongst which will be found many new and desirable plants.

The following new plants are now on sale:

SEEDLING GLOXINIAS.

ELEANOR.—Ground colour pure white, blotched with rose, and shaded with purple.
ELEGANTISSIMA.—Ground colour French white, of great substance, centre pale lavender, spotted with buff.
EUGENIE.—Ground colour rosy pink, centre creamy white, spotted with rose.
EXQUISITE—Ground colour pure white, with broad belt of puce, throat creamy white, spotted with puce.
MAGNET.—Ground colour clear rose, with blotch of purple in the throat, flowers large, of fine form.
PRINCE OF WALES.—Ground colour white, shading off to lavender.
SIR C. NAPIER.—Ground colour deep rosy crimson, throat blotched with intense rose, dwarf habit.

The above seven Gloxinias will all be found to be fine varieties, with large well-formed flowers standing well up above the foliage. 7s. 6d. each, or 42s. the set.

CINERARIA EVA.—Ground colour pure white, with narrow margin of purple, dark disc, fine form and substance; received a Certificate at the National Floricultural Society. 10s. 6d.

GERANIUMS.

DIADEMATUM REGINA.—Ground colour deep shining rose, upper petals veined with dark purple and white, with blotch of bright orange crimson; very dwarf habit, and abundant bloomer; a fine variety for bedding. 7s. 6d.
DIADEMATUM SIDONIUM MULTIFLORUM.—Lower petals rosy purple, shaded with crimson; upper petals orange crimson, veined with dark maroon; trusses large, habit dwarf and compact, abundant bloomer; a fine variety for bedding. 10s. 6d.
PRINCESS.—Ground colour blush white, veined and shaded with carmine, dark horse-shoe foliage, large globular-shaped trusses, and most abundant bloomer. 7s. 6d.

CETERACH MARANTA (syn. Nothoclena maranta).—A new hardy Fern from the Alps of Switzerland; fronds bipinnate, about 8 inches in length, densely coated with golden brown scales on the under side. 15s.
Pine-apple Place, London, May 27.

Verbenas, of the choicest kinds, including all the most approved of the Continental varieties, 4*s.* and 6*s.* per dozen.

Petunias, of the best kinds, 4*s.* to 6*s.* per dozen.

Oxalis rosea, one of our prettiest rose-coloured hardy bedding plants, of dwarf habit, and nearly always in flower, 6*s.* per doz.

Œnothera riparia, a pretty trailing plant, of dwarf habit, quite hardy, producing a profusion of canary-coloured blossoms throughout the year, 6*s.* per dozen.

Heliotropes, in fine variety, 6*s.* per dozen.

Anagallis rubra grandiflora, fine for bedding, 4*s.* per dozen.

Cuphea platycentra, 4*s.* per dozen.

Lobelia racemoides and lucida, 4*s.* per dozen.

Antirrhinums, of the finest kinds, 6*s.* and 9*s.* per dozen.

Pentstemons, do. do., 6*s.* per dozen.

Gorteria pavonia, a fine hardy plant, of trailing habit, producing throughout the year a gorgeous display of orange-coloured flowers, spotted with black, 9*s.* per dozen.

Campanula corallina, an extremely pretty dwarf hardy bedding plant, of compact habit, bearing a profusion of light-blue bell-shaped flowers from May till November; 6*s.* per dozen.

Neirembergia filicaulis, 6*s.* per dozen.

PHLOXES.—The following fine varieties, 9*s.* per dozen :—Spenceri, Imbricata, Abdel Medschid Khan, Anais, Captivation, Elegantissima, Eliza, Hydrangæformis, Imperialis major, Roi Leopold, Macrantha, Madame Courcelles, Madame Poivre, Napoleon, Nelsoni, Princesse de Cleves, Speciosissima, Villaret Joyeuse, Princesse Marianne, Speculum, &c.

Potentillas, of the handsomest varieties, by name, 6*s.* per dozen.

Mimulus Colei and purpurea maculata, two fine hardy varieties, forming bushy plants, 1½ ft. in height, the former producing bright red flowers, with dark maroon centre; the latter purple flowers, with crimson centre; 6*s.* per dozen.

Daisies, new Belgian, in 50 fine varieties; 4*s.* per dozen.

Salvia oppositifolia, 4*s.* per dozen.

Silene maritima plena, fine double white, very compact habit, 9*s.* per dozen.

Statice maritima rosea, a fine hardy plant, of dwarf habit, producing throughout the year numerous heads of bright rose pink flowers, 6*s.* per dozen.

Dielytra spectabilis, 9*s.* per dozen.

Funckia grandiflora, 2*s.* 6*d.* each.

Rockets, double white, 3*s.* per dozen; purple, 4*s.* per dozen; crimson, 1*s.* 6*d.* each.

Calystegia pubescens (double rose-coloured Convolvulus), quite hardy, 9*d.* each, or 6*s.* per dozen.

Herbaceous Plants, in fine variety, 25*s.* per 100.

FUCHSIAS.—Possessing a fine stock of the following new varieties, we offer them at 12*s.* per dozen, viz.:—Duchess of Lancaster, England's Glory, Incomparable, King Charming, Perfection, Globosa perfecta, Glory (Banks), Model, Premier, Commodore, Bride, Ariel, and Henderson; fine kinds of the older favourites, 6*s.* per dozen.

CARNATIONS AND PICOTEES.—Beautiful selections from our extensive collection, at 18*s.*, 24*s.*, and 30*s.* per dozen pairs; fine mixed, for borders, 9*s.* per dozen pairs. True Old Clove Carnation, 12*s.* per dozen pairs.

PANSIES.—The following choice kinds, at 10*s.* per dozen varieties :—Alba Superba, Androcles, Blanche, Cæsar, Calysto, Caroline, Commander-in-Chief, Crystal Palace, Drusilla, Duchess of Rutland, Elegant, Emma, Euphemia, Glory, Helen, Heroine, Indian Chief, Isabella, Junius, Lady Carrington, Lady Franklin, Lady Harding, Lord Jeffery, Marchioness of Lothian, Masterpiece, Miriam, Miss Talbot, Mrs. Beck, Penelope, Polyphema, Post Captain, Prince Arthur, Princess, Queen of England, Rubens, Sambo, Smolensko, The Rajah, Uttoxeter Hero, Viceroy, Yellow Prince.

CHRYSANTHEMUMS, comprising the very best of the new kinds of large flowering and Pompon varieties, in strong plants, 9*s.* per dozen.

☞ Less quantities than those named above supplied at the same prices. Orders of 2*l.* and upwards are delivered Carriage Free to London, Hull, Newcastle-on-Tyne, or to any Railway Station within 150 miles of the Nursery.

YOUELL & CO., Royal Nursery, Great Yarmouth.

BEDDING PLANTS.

BASS AND BROWN have a large Stock of the following, VERY STRONG and FINE :—

VERBENAS, in 50 choice varieties, 30*s.* per 100; 3*s.* 6*d.* per doz.
" 20 best new varieties of 1853, 20*s.*
PETUNIAS, 32*s.* per 100, in 30 choice varieties; 4*s.* per dozen.
" 10 best new, of 1853, 10*s.*
FUCHSIAS, 32*s.* per 100, in 50 choice varieties; 4*s.* to 6*s.* per doz.
" 15 best new varieties of 1853, 35*s.*
ANAGALLIS GRANDIFLORA, COCCINEA, AND CÆRULEA, 35*s.* per 100; 4*s.* per dozen.
HELIOTROPES, 4*s.* per dozen, or, in 9 fine varieties, 6*s.* per doz.
DWARF ROCK CISTUS, 24 splendid new varieties, 15*s.* per doz.
ANTIRRHINUMS, in varieties, very fine and select, 7*s.* 6*d.* p. doz.
PENTSTEMONS, in 6 very fine and select varieties, 7*s.* 6*d.* p. doz.
PHLOX, 50*s.* per 100; 50 choice hardy varieties, 6*s.* to 9*s.* per doz.
" 6 fine new varieties of 1853, 12*s.*
CHRYSANTHEMUMS, 42*s.* per 100; in 100 choice large flowering and Pompone varieties, 5*s.* to 7*s.* 6*d.* per doz.
" 10 best new large flowering varieties, 10*s.*
" 21 best Pompone new varieties, 20*s.*, or 12 for 12*s.*
HERBACEOUS PLANTS, 100 fine and showy varieties, 30*s.*
" 100 varieties, including new, 50*s.*
ROCK PLANTS, 25 fine varieties, 12*s.*
HARDY CLIMBING PLANTS, fine varieties, 12*s.* per dozen.

GERANIUMS.—SEVERAL THOUSANDS OF THE BEST IN CULTIVATION, VERY FINE AND STRONG.

We beg to refer purchasers who wish to make their own Selection to Advertisements in the GARDENERS' CHRONICLE *of March 27th, page* 179 ; *and April 8th, page* 210, *of these and many other new Plants :—*

18	Best new of last season ...	...	...	...	66*s.*	0*d.*
12	" " ...	...	...	...	44	0
30	Very choice, of previous date ...	...	...	...	45	0
12	" " ...	...	...	...	18	0
	Fine vars., 6*s.* to 12*s.* per dozen.					
6	Best Fancy vars. of last season	...	...	...	18	0
12	Very choice of previous date ...	...	...	...	18	0
	Fine vars., 9*s.* to 12*s.* per dozen.					

Complete Catalogues free by post for six penny stamps.

Goods Carriage free (not under 20*s.) to all the London Termini and all Stations on the London and Norwich Colchester Line ; and Plants added gratis with orders of* 40*s. and upwards.*

Post-office Orders payable to BASS & BROWN, or to STEPHEN BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

FUCHSIA DUKE OF WELLINGTON.

J. MOORE AND SON beg to offer a few fine young plants of the above, which are from 1½ to 2½ feet high, well furnished with branches, and calculated to make fine specimens for the July Exhibitions. Price, 15*s.* to 21*s.* each. Also smaller plants, at 10*s.* 6*d.*, with usual discount to the trade.

Perry Barr Nursery, near Birmingham, May 27.

The Gardeners' Chronicle.

SATURDAY, MAY 27, 1854.

MEETINGS FOR THE ENSUING WEEK.

FRIDAY, June 2—Botanical ..... 8 P.M.
SATURDAY, — 3—Horticultural Gardens..... 2 P.M.

COUNTRY SHOWS FOR THE MONTH OF MAY.—29th: Hunslet.—30th: Truro.

WE beg to direct attention to the announcement in our advertising columns that in consequence of the QUEEN having been graciously pleased to name Saturday, June 10, as the day on which Her Majesty will open the Crystal Place, the next meeting of the Horticultural Society at Chiswick, previously announced for the same day, will be held on Saturday, June 3, instead of Saturday, June 10.

FEW circumstances occasion greater annoyance in gardens than OBSTRUCTIONS produced IN DRAINS by the roots of trees or other plants. After great expense has been incurred in leading off water, and all possible precautions taken to secure the permanance of the action, it is suddenly discovered that the drains refuse to draw. Pipes of considerable diameter are choked up, water is dammed back, and land thought to be secured against any possible inundation threatens to become a swamp once more.

Of this a striking example has just occurred at Florence Court, the seat of the Earl of ENNISKILLEN, in consequence of the intrusion of the roots of a large tree of Salix alba, which in the short space of 18 months did its work most effectually. The pipe-tiles of 4-inch bore were laid in a drain 4 feet deep, and covered up in July 1852; in January of the present year the drain was observed not to be acting, and was in consequence opened; the pipe was completely choked with roots, to the distance of 51 feet, and the mass of roots so interwoven as to resemble a thick rope.

Two circumstances more especially deserve notice in this case. In the first place, the pipes were collared; that is to say, each joint in a line of pipes was secured by an external short pipe. Hence it appears that collaring does not offer an effectual barrier to the passage of roots into drains. Secondly, the position and distance of the Willow tree in question seemed to render the introduction of its roots improbable. It stood upon the top of a bank between 6 and 8 feet above the level of the drained ground, while the drain that was choked was sunk 4 feet below the level, and was 9 feet in a direct line from the tree. Nevertheless, the roots, after passing 7 or 8 feet perpendicularly down the embankment, and then travelling somewhat obliquely 9 feet further, reached a depth of 4 feet, and then having insinuated themselves into some crevice, in 18 months spread above 50 feet further, filling in their course a 4-inch bore as completely as if they had been rammed into the space.

This will be a warning not to trust the white Willow anywhere in the neighbourhood of drains. The tree before possessed a very bad reputation, which the present case will not assist to clear.

An extract from the second edition of the "Theory of Horticulture," now passing through the press, may be taken to illustrate further this phenomenon.

"Roots being furnished with the power of perpetually adding new living matter to their points, are thus enabled to pierce the solid earth in which they grow, to insinuate themselves between the most minute crevices, and to pass on from place to place as fast as the food in contact with them is consumed. So that plants, although not locomotive, like animals, do perpetually shift their mouths in search of fresh pasturage, although their bodies remain stationary.

"Many examples of this might be adduced. The following are, however, sufficient. In a garden at Turnham Green, a Populus monilifera (Canadian Poplar), was found to have sent a root 30 feet horizontally, including its dip beneath the foundations of a wall, and then to have passed into an old well to the depth of 18 feet, having then broken up into a mass of fibres so finely divided as to resemble yarn. In another case, a root of the Deciduous Cypress was found by the author, 11 feet long, which had passed nearly to that length without division in search of water.

"Mr. TYSO, of Wallingford, mentions the case of a Mignonette plant which had penetrated through several courses of bricks, and descended far into a wine cellar. Over the cellar, which was outside the dwelling-house, was a brick pavement, between the joints of which Mignonette seed had been sown from year to year. At the extreme end a small portion of soil was allowed, and here a plant or two grew more vigorously than the rest, though not so luxuriantly as is often found in a common border. The roots of these plants had penetrated through 18 inches of brickwork, and some of them were hanging inside the arched roof, nourished by the damp atmosphere only. A few, more favourably situated, were attached to the end wall of the cellar, and had descended 5 feet 5 inches down the wall into the decaying sawdust of the wine-bin. Others were beautifully spread over the wall, with a thousand ramifying rootlets, bespangled with minute crystal-like damp drops, and extending over a space of 5 feet in width. It was difficult to trace the brittle roots that had penetrated the sawdust, but he measured some upwards of 7 feet below the surface of the brickwork on which the plants were growing. It is this peculiarity which renders it so difficult to keep drains or wells in working order where roots have access. A well 6 feet wide has been known to be filled with roots by a common Laurel bush. Turnips and Mangold Wurzel, as well as mere weeds, have great power in this way. PATRICK NEILL mentions an instance of a plant of Ragwort (Senecio Jacobæa) which had insinuated the point of its roots into a drain, and had then extended them so much as to fill the drain completely for about 20 feet. And thus it is seen that it is by the point that roots extend, with an indefinite power of branching, and that the finest thread once introduced into a drain-pipe will rapidly become the origin of most extensive mischief, provided the plant is perennial. A still more remarkable case is mentioned in the *Gardeners' Chronicle* for 1849, of a line of pot pipes from 40 to 50 feet long, socketed and cemented, and thought to be perfectly closed, having become so choked by roots as to be unserviceable in 15 years. In the side of one of the pipes there had been *one* mere chink; and through that chink some tree had insinuated the point of some root. Once inserted, the point lengthened and divided, and lengthened and divided over and over again, till at last the drain-pipe was filled by an entangled mass of fibres, which had pressed so firmly against each other as to form in some places a tolerably perfect mould of the cavity.

"Roots lengthen, as already stated, not by extension, but by perpetual additions of very soft cellular matter to their points. That matter is, in fact, in the beginning mere mucilage, capable of organisation. A small portion of this mucilage finds itself in contact with a minute cleft; conditions, the real nature of which is unknown, cause the mucilage to press against the

cleft; the mucilage is introduced, it organises, solidifies, and the point of a root is established in the cleft. The point forms more mucilage in advance; that also solidifies, and a further lodgment is made; and thus the growth goes on, through all the sinuosities of the narrow passage that it traverses."

The great question as to how and where more materials are to be procured, on the one hand for dispensing with Russian Hemp, and on the other for the manufacture of Paper, is apparently approaching a solution. The specimens of textile substances from British colonies, for a knowledge of which the mercantile community is mainly indebted to Dr. Royle, show conclusively that the Russian trade in hemp may be annihilated for ever if we have but spirit and sense enough to employ our own resources. Come what may of the present war, this at least seems certain, that it will do us the service of compelling our merchants and manufacturers to transfer their trade to the tropical possessions of the British crown, instead of contributing to the luxury of Russian nobles.

The Rheea fibre of Assam can be sold cheaper in London than Russian hemp, and is far more fit for all purposes of strength. Nor do we despair of seeing it some day quoted among the staple products of South-Western Ireland, in which country we observe with satisfaction that trials of its culture are actually in progress. To the quantity of Pine-apple fibre of all degrees of fineness, from what will make a cable for the Royal Albert, to such as is fit for a cambric handkerchief, there is no assignable limit. The wild plant swarms in every part of the tropics; although a native of South America, it already overruns the forests of humid Africa, and every island in the Indian Ocean. Specimens of its fibre were produced last Tuesday before the Horticultural Society, by Dr. Royle, from Madras, Singapore, Java, and Celebes, the whiteness and fineness of some, and the toughness of all of which attracted great attention. We observed a tent-making acquaintance pulling at the delicate threads of fine yarn with equal surprise and satisfaction. With this valuable material the Pine-apple leaf is filled; and there is no difficulty in the separation. If merchants do not acquire this and similar materials in such abundance as would satisfy every demand of commerce, it will be owing to their own *laissez aller* system, and to nothing else.

Among the novelties produced on the occasion referred to, was one from Joseph Budworth Sharp, Esq., of 44, Myddelton Square, Pentonville, which more especially deserves mention. There is no more common plant in the hot damp parts of the tropics of America, growing wild and forming impenetrable thickets, than what botanists call the Bromelias Penguin and Karatas, with some other allied species. These plants furnish fibre in even more abundance than the Pine-apple itself. We have now before us a portion of bleached yarn prepared by Mr. Sharp, which appears to possess scarcely less strength than the Rheea or China Grass itself. The plants that yield it are to the tropics what Thistles and Docks are to our own ill-cultivated fields. They are to be had for the gathering, and are in all senses mere waste productions; no skill is wanted to cultivate them, and no more labour to gather them than can be performed by women with long-handled sickles or a Scotch bill. Colonists must be uncommonly blind to their own interests if they do not speedily bring them on the English market, provided they can find a broker who knows how, or cares, to escape from the narrow routine of selling sugar, coffee, cocoa, rum, and molasses.

As regards paper, the anticipations in which we and others have ventured to indulge as to the fitness of the Musa or Plantain stems for that manufacture are already realised. Mr. Sharp produced on Tuesday both first-class writing-paper and coarse packing paper, the quality of which cannot, we venture to believe, be approached in the market. The first was all that could be desired in whiteness, and for face even photographers would admire it; while both possessed the toughness of vellum rather than of paper. We had the pleasure to be informed, in addition, that this Plantain stuff can compete advantageously in price with rags, and that enormous quantities may be soon expected in England,—a fact which we respectfully submit to the paper manufacturers, for whose convenience we have given above the address of Mr. Sharp himself.

VEGETABLE PATHOLOGY.—No. XXI.

91. As the parenchym of the leaf is confluent with the young green bark, so the cuticle is a continuation of that of the bark, though by no means constantly of the same duration. The rapid growth of the latter, in many instances, soon causes the cuticle to be ruptured, and then the immediate contact of the exposed tissues with the external atmosphere favours decomposition, in consequence of which the cuticle is liberated or destroyed, and is never renewed. The cuticle of leaves is seldom ruptured except by accident, but in the species of *Diospyros*, lately figured in this journal as illustrative of MM. Huc and Gabet's tree of ten thousand images, such a rupture had taken place from some peculiar condition of the parenchym. It is this comparative indestructibility of the cuticle of leaves which enables many to survive more than a single season, but even in those whose duration is confined to a few months, the decay does not arise from the undue admission of external elements, but from the vitality of the cells which compose the parenchym being exhausted, consequent on the consummation of their especial functions.

92. It is probable that the true cuticle is, in most cases,* quite impervious to both air and moisture, which can act in consequence only by the intervention of the stomates. By these, both air and moisture, whether combined with the air or in a fluid state, are brought into direct contact with the walls of the cells, in consequence of which a reciprocal action takes place, which, by reason of some vital phenomena, varies greatly in energy according to attendant circumstances. The perspired moisture is, in most cases, in the form of invisible vapour, which is readily condensed against the cold walls of a bell-glass covering the plant; but, in many instances, the discharge of fluid is so energetic that it does not assume the form of vapour, but drips from the tips of the leaves on their serratures, as from those of Canna, or the common Vine. In all cases where perspiration is extremely active, the plant must suffer materially, if the root, with its ramifications, does not bear a due relation to the foliage. Hence, in many cases, injudicious root-pruning, or excessive destruction of the foliage, are equally injurious.

93. This perspiration is not a mere evaporation arising from atmospheric or other evident physical causes, but must be regarded as due, in a greater or less degree, to vital agency. It is very materially increased by direct exposure to solar light, and comparatively small where light is feeble; and, as the health and nutriment of a plant depend very greatly on the rapidity and completeness of the perspiration, and other concomitant phenomena dependent on the presence of light, it follows that, with certain exceptions, plants cannot exist in a healthy state in a dark shady situation, or except in species peculiarly constituted when immersed in water, which must entirely prevent perspiration.

94. Newly transplanted vegetables must not therefore be too rapidly exposed to the direct rays of the sun, even where moisture can be supplied without stint, and hence the advantage of covering young cuttings with a shaded bell-glass, securing at once a moist atmosphere, especially where the bell is double, and a feeble light. That the moisture is really absorbed by the stomates seems almost demonstrated by the beneficial effects of syringing, especially when the air is dry, for the benefit is scarcely due to decreased perspiration arising from the depression of temperature incident to the contact or evaporation of the water sprinkled on their leaves.

95. Where, however, a plant is in full vegetation, defect of light from this cause, and from another to be mentioned presently, is sure to cause a dropsical and debilitated state of the health, and it is the difficulty attendant on the due regulation of light, heat, and moisture, which in some cases, as in the Melon, makes even the best cultivation so uncertain. Some plants, however, will not thrive when exposed to the sun, and therefore a northern border is the situation in which alone they can be expected to flourish. Whether this impatience of light is due to any peculiarity of the cuticle, or to an extreme irritability of the tissues of the leaf, does not appear at present to have been ascertained. *M. J. B.*

* Aquatic plants probably absorb moisture by their whole surface, and are therefore far more rapidly withered when exposed to the air than other vegetables. In some cases, where there are no stomates, and in many cryptogamic plants, water certainly penetrates extensively by the outer surface, but frequently causes those parts only to revive with which it is in immediate contact.

TABERNÆMONTANA CORONARIA FLORE PLENO.

Although this fine stove shrub has long been common in well-managed collections, it is not so generally cultivated as it deserves to be. Its large white flowers are hardly inferior to those of the Gardenia in fragance, and last longer in beauty, and are produced very thickly under proper management.

Being a native of the East Indies, it requires a warm moist temperature while growing, with a liberal supply of water at the root, but when the wood is formed, from which flowers are expected, it must be subjected to a period of cool dry treatment, to thoroughly ripen the wood, which is essential if a good display of blossom is wished for. By the exercise of a little forethought and attention, to get the wood properly ripened, and allow the plant a period of rest, it may be had in bloom at any time from March to November, as properly ripened wood will never fail to produce flowers.

Young plants should be placed in a moist growing temperature of about 65° by night, and 75° by day as early in spring as circumstances will admit; and if they can be afforded a bottom-heat of about 85°, this will greatly assist in promoting active growth. At this season the plants should be kept near the glass, and afforded all the light possible, admitting air whenever the state of the weather will permit, in order to prevent long-jointed weakly growth. If dwarf short-jointed plants have been selected, the points of the shoots may be pinched out, tying the latter down to induce the lower buds to start, but if the plants are straggling they had better be sufficiently cut back to secure a close habit. Shifting must be attended to as soon as the pots are moderately well filled with healthy roots, using pots one or two sizes larger, according to the vigour of the plants. If in bottom heat, great caution will be necessary, for a fortnight or so after potting, to apply water properly; for when the pots are plunged, it is not so easy to judge of the state of the soil as when they are exposed; and so little is required in this case, that beginners are very apt to water too frequently, and many a promising plant is thus ruined. Care should always be exercised to ascertain the state of the soil before giving water, and there should be no dribbling, or mere surface watering, but enough should be given to thoroughly moisten the ball, giving no more until it is absolutely wanted. As the season advances, it will probably be necessary to afford a slight protection against bright sunshine, but only a thin shade should be used, and this as sparingly as can be safely done. As soon as the pots are found to be well filled with roots, give a second shift, unless that should not be the case until towards the end of the growing season, when it will be better to avoid shifting till the following spring. Maintain a thoroughly moist atmosphere, and syringe the plants over-head on the mornings and evenings of bright days in summer; and also keep the shoots regularly tied out and stopped, as may be necessary to secure a compact bushy habit; but in the case of plants intended to bloom the following spring, stopping must not be practised later in the season than will allow of getting the young wood properly matured before winter. If the plants can be placed in a pit or house where the temperature may range about 55°, this will form a suitable situation for them in winter, and if proper care has been exercised to get the wood well ripened in autumn, the night temperature may be allowed to fall as low as 45° in hard weather. Give very little water to the soil at this period, only just sufficient to preserve the roots in a healthy state, but draw the syringe over the foliage occasionally on the morning of a bright day, so as to clear it of dust, &c. If it is intended to grow large specimens before allowing the plants to flower, place them in a moist temperature of about 65°, by fire heat, as early in spring as circumstances will permit, and afford them a brisk bottom heat, to induce a vigorous root action. See to the state of the roots, and shift before these suffer for want of pot room, also keep the shoots tied out and stopped as may be necessary to secure bushy growth, and otherwise treat the plants as recommended for last season. While in bloom the specimens may be placed in a cool house, but they must be carefully guarded from damp in the atmosphere, and after flowering they should be cut back as may be required, and re-potted, but with an occasional watering with manure water during the growing season, they may be kept in good health for several seasons without re-potting. For soil use good fibry peat and loam, in the proportion of three parts of the former to one of the latter, adding a sufficient quantity of silver sand to ensure a free percolation of water through the ball after the decay of the fibre. Cuttings of moderately young wood soon root if planted in sandy soil, covered with a bell glass, and afforded a sharp bottom heat of 80° or 90°. *Alpha.*

EFFECTS OF THE WINTER AT BIDDULPH GRANGE.

About the middle of February, I had drawn up a short paper with the above heading, but withheld it, in consequence of a wish expressed in the *Gardeners' Chronicle* that all such contributions should be postponed till the middle of May. The wisdom of such postponement is strongly borne out by my own experience, for several plants returned as alive in the former paper must now be numbered with the dead. I would observe, at the outset, that Biddulph Grange is about 30 miles in a direct line from the sea, and about 300 feet above the sea level; the situation rather exposed, and the climate cold and damp.

Conifers (none of these received the slightest protection), the following killed: — Pinus Russelliana, P. Llaveana, P. patula, P. Teocote, some specimens of P. insignis and P. californica (others have escaped), P. Pinea; Abies Brunoniana, Juniperus tetragona, Cupressus elegans (this, I believe, is the same as C. Knighti of some nurseries), C. funebris, C. torulosa, C. Uhdeana, and C. thurifera.

Among varieties that have escaped with slight injury I am happy to be able to reckon Fitz-Roya Patagonica, Saxe-Gothæa conspicua (the former with me is the tenderer of the two) and Libocedrus chilensis. The following are quite unscathed:—Abies Jesoensis, A. orientalis, A. grandis, A. nobilis, A. Nordmanniana (no Abies is so late in pushing, and therefore so secure of injury from late frosts as this) Pinus Massoniana (a fine species from Japan), P. Lindleyana (a most lovely kind, and quite distinct from the next, with which it is frequently confounded) P. Montezumæ, P. Hartwegi, P. Fremontiana, P. Benthamiana, P. cembroides, P. Lambertiana, P. monticola, P. ayacahuite, P. muricata.

Cryptomerias have stood well, especially such as face the north (those to the south are browned). C. Lobbi is a decided improvement on C. japonica, for it has retained its fresh green colour unimpaired through the winter; and this, too, by the side of plants of C. japonica which have turned perfectly brown.

Cephalotaxus Fortuni (male and female) has proved

21—1854.] THE GARDENERS' CHRONICLE. 341

itself perfectly hardy—withstanding, not the winter only, but the pinching frost of the 24th ult., although its shoots were then much advanced. This promises to be a great ornament to our Pinetums. C. Harringtoni and C. drupacea are also unharmed.

Araucarias were uninjured by the winter, but some of the young shoots have suffered slightly from the terrible April frost.

Berberis Darwini, perfectly hardy and flowered freely, though some of its blossoms were cut by the April frost.

Libocedrus chilensis hardy and highly ornamental, though some of its later autumnal growth is slightly injured.

Juniperus drupacea, which will, I think, prove a beautiful species, is uninjured; as is also the lovely Chinese plant known in the nurseries under the absurd name of J. oblonga pendula, a species which bids fair to rival C. funebris, even in localities where the latter will thrive. But of all the Junipers, I most admire the blue Juniper of the Himalaya, plants of which are here already assuming something of the character portrayed by Dr. Hooker, in one of those exquisite vignettes that adorn his "Journals," and to which allusion has been already made in your pages. One of my plants has nuts or berries upon it of the size and colour of green Gooseberries.

The mention of Dr. Hooker and the Himalaya necessarily brings to mind the phalanx of extraordinary Rhododendrons that he was so fortunate as to discover in Sikkim; of these I only ventured to expose two, viz., R. glaucum and R. niveum, both of which have stood the winter well. R. glaucum has even retained its flower buds in spite of January and April frosts. All these plants should, I am convinced, face the north, and should be planted at the foot of walls, or—which is much more in character—perpendicular faces of rock. In the latter position I am now turning out about 20 species, and hope to report progress next year. I think it is not generally known that Mr. Nuttall, that veteran botanist and traveller (now of Rainhill, near Liverpool), has in his possession living plants of many perfectly new Rhododendrons, collected by his nephew, Mr. Booth, in the Bhotan Alps, some of which promise to rival, if not to surpass, even Dr. Hooker's most brilliant discoveries. R. eximium, which stood the last winter without any protection, has leaves 2 ft. long! R. Nuttallii has larger heads of flowers, and the flowers individually are larger, than those of R. Dalhousiæ! This is probably the finest plant of the tribe; but it requires the protection of a cool greenhouse. While upon this subject, I cannot avoid remarking that a rich Rhododendron harvest probably still awaits the adventurous traveller in Nepaul. If you look at the map of India you will find Sikkim occupying nearly the centre of the vast Himalayan range. Here Dr. Hooker discovered about 30 new species. On the right of Sikkim come the Bhotan Alps, where Mr. Booth detected nearly 20 species distinct from those previously discovered in Sikkim by Dr. Hooker. But if Bhotan on the right of Sikkim be thus rich in new Rhododendrons, why should not Nepaul on its left have an equal amount of novelty in store for the first botanical collector who explores the interminable valleys of its interior?

Among miscellaneous plants, I am glad to report Laurus regalis (the Californian Bay), as quite safe; the common Bay having nearly perished. The lovely little Mexican Gaultheria (G. nummularia) is scarcely touched, and is now shooting freely; the Koordistan Oaks stood the winter bravely, but were pinched by the April frost. They are now, however, pushing again most vigorously.

Cordyline (Dracæna) indivisa has been killed down to the ground, but is throwing up suckers. In former winters I have secured this plant from harm by merely tying up its leaves in a bundle, and so preventing snow or wet from lodging in its heart. The Pampas Grass is pushing freely. Garrya macrophylla in a sheltered situation is uninjured. Quercus sclerophylla killed to the ground. The Koordistan Oaks quite safe, and now breaking freely, although slightly affected by the April frost. The following Lilies have got well through the winter without any other protection than wooden shutters open at the ends, and a few coal-ashes strewed over their roots:—L. giganteum, L. venustum, L. testaceum, L. colchicum, L. Thomsonianum, L. tenuifolium, L. Catesbæi, L. sanguineum, L. lancifolium, L. californicum, &c. Lilium Wallichianum appears to be more tender, it having died under the preceding treatment. *J. B., Biddulph Grange, May* 23.

Home Correspondence.

Woods and Forests.—Being one of those who see the great value of the reports written by Mr. Brown, on the public forests, and who feels disgusted by the treatment which he has received at the hands of the underlings of the Treasury, through an intrigue unworthy of the English character, I beg permission to inform you that Mr. Brown's abilities and unblemished character are valued by those who act from purer motives than the Treasury, and that Mr. Brown has been instantly sought for, and taken into the employment of a noble lord, with emoluments more advantageous to him than if he had remained in the employment of the Woods and Forests. The Treasury will speedily discover that injustice and low intrigue cannot prosper, and public resentment will overtake those tapers and tadpoles who exercise enormous power, to the infinite injury of the public interests. *A Spectator, near Gloucester.*

Rain Gauges.—The following are all weights of rain taken from the large gauge when none was obtained from the other. The large gauge is made of thin lead, resting upon wood, and I do not think that the weight of metal it contains is greater than that in the small gauge, the area of one being taken as 226¼ more than the other. I have, besides, but little doubt that if the small gauge and bottle were weighed in accurate scales, before and after a damp night, or after a very slight rain, that it would give a distinct increase. The object I had in view in putting up the large gauge was not to ascertain the relative accuracy of large and small gauges; but to catch a large quantity of pure rain-water for the purpose of analysis; and while doing so I thought I might as well test the accuracy of the common rain gauges.

Weights of Rain in Pounds, Ounces, and Tenths of an Ounce, during One Year, taken from Large Gauge when none was found in Small One.

freezing point, and on the 24th of April, when it fell 13°. *P. Frost.*

Melons.—Can any one inform me, through your journal, the cause of my Melons not swelling their fruit? Having grown them with remarkable success for these last 16 years, I am now at a loss to know the cause. The plants in question are grown in a 3-light pit, and heated with dung under the plants, with a hot water pipe all round, to keep the pit to one temperature. I duly fertilise all the female flowers, of which upwards of 150 have been done, and out of that number I have only four Melons swelling. The plants are in the best possible health; neither have I observed a single insect on the leaves. I allowed the Vines to reach the sides of the pit before I stopped them; and now I give them plenty of air, and keep them rather dry; but as soon as the flower closes, the fruit turns yellow. The plants are not too luxuriant (as is so often the case with young hands), mine being planted in some nice maiden loam, the same kind as I have always grown them in. *G. Batchelor, Castle Malwood, near Lyndhurst, Hants.*

M'Adam's Anti-Blight Composition.—I, as well as some of my neighbours, have used this composition with very great success; but to attain the desired end some care is undoubtedly necessary in applying it, as it is important that all the foliage and fruit should be thoroughly wetted with it, otherwise a partial failure will probably ensue; for unless you bring all parts affected with the mildew under the direct action of this, or indeed of any other remedy, you have a source from which, sooner or later in the season, mildew will in all probability be again developed. This, indeed, was the case to a certain extent in my own Vinery last year, in which the blight got so diffused before I happened to observe it, that by penetrating the half grown and partly closed bunches of fruit (the berries not having been properly thinned), some of the mildew had doubtless got beyond reach; the consequence was, that several times during the season I observed traces of it again in the Vinery; but, to use your correspondent's expression, "a vigorous syringing" with the mixture promptly destroyed the fungus, which, I am satisfied, may always be easily kept under in this simple way. I believe, however, notwithstanding the undoubted property M'Adam's sulphuretted solution has in destroying Grape mildew, if carefully and diligently used, it will be found more valuable as a preventive. It should be applied by a good syringe in the early part of the season, before the Vines come into bloom, and should be continued at about monthly intervals throughout the growing season, so that the action of the composition may be sustained; for if the slight sulphuretted deposit (or whatever else the solution may contain) is allowed to pass off entirely by evaporation before another application of the liquid takes place, its preventive properties may not, I think, be so effectual. I have adopted the plan of monthly syringing with this mixture myself this season, and have not discovered a trace of mildew in my Vinery, although other houses in the neighbourhood have certainly been attacked by it. There is one recommendation also in M'Adam's directions respecting the syringe, which, although simple, may be useful when a powerful jet is required, and which is obtained (the rose of the garden engine being preferred) by filling up all the outer apertures of the rose with white-lead or wax, leaving open only two or three in the centre; by adopting this contrivance I find that a very powerful and continuous stream is obtained, fully sufficient for the purpose, and with so little exertion that a lady may use the engine this way without the slightest fatigue. *Vigneron, Torquay.*

Laburnum Sports.—Having some time since noticed in your columns remarks on the sporting freaks of the purple Laburnum, I am inclined to add another notice of (I believe) a more rare occurrence than the appearance of the Cytisus Juniperus. I have this week been amused at seeing flowers of the yellow Laburnum appearing high up among the tufts of Cytisus Juniperus, which have from time to time shown themselves on the purple Laburnum. Is this usual? [Yes.] *E. T. W., Chepstow.*

Late Spring Frosts, &c.—The frost of the 24th and 25th ult. was much more destructive in its operation than that of the 2d and 3d of January. The thermometer in the night of the 24th stood at 23°, on the night of January 2d, at 5°. The only thing particularly injured by the first of these frosts were—Benthamia fragifera, Garrya elliptica, Colletia spinosa, Cupressus torulosa, Photinia serrulata, Quercus suber, Vaccinium Myrsinites; Aloysia citriodora killed, though it has stood five years. By the last frost the following have severely suffered—Azaleas, Box edgings, Laburnums, Paulownia imperialis, Pavia rubra and macrocarpa, Tulip tree, Rhododendrons (early sorts), Spiræa Lindleyana, S. barbata (nearly killed), Wistaria (all the flower buds killed). The summer Roses are dropping nearly all their buds, and the young shoots of most of the forward trees are black and dead. Of herbaceous plants, the two Funckias Sieboldi and cærulea are very much injured; but I think they are the only two of what I class as hardy that have suffered. Now, of things which are untouched, I must say somewhat, for I think this more worthy of record:—Eccremocarpus scaber, in the open ground, without even a covering of ashes, is shooting strongly. Unhurt are—Caprifolium longiflorum and C. Youngi, Cistus formosus, Erica mediterranea, Forsythia viridissima, Buxus balearica, Quercus Turneri (an excellent evergreen Oak), Rhododendron campanulatum hybridum, quite uninjured; Weigela rosea and Lonicera splendidissima. Of herbaceous plants unhurt are—Chilian Alstrœmerias, Dianthus fulgens, Epimedium colchicum, E. violaceum, E. Muschianum, E. macranthum, E. grandiflorum, E. pinnatum elegans, Silene Schafta, Spigelia marilandica, Tritoma media, and T. uvaria. Against a wall, unhurt, are—Clematis azurea grandiflora, Cistus ladaniferus, and Jasminum nudiflorum. Looking over my lists again, I find I have omitted, as killed by the January frost, Veronica Lindleyana and Armeria formosa. And by the late frost are much injured—Cedrus Deodara, Dielytra spectabilis, cut to the ground; Campanula pyramidalis, injured in the leaves; Jasione perennis, Agapanthus umbellatus, under a south wall, but coming up again strongly; Lilium lancifolium rubrum and L. testaceum, lower leaves browned, but plants not much hurt; L. superbum and L. venustum, uninjured. Cherries and Plums are all destroyed. Pears and Apples will give, I think, a moderate crop; Currants and Gooseberries plentiful; Strawberries safe, except the blooms which were open. The thermometer was at 30° on the night of the 16th of May. *A. R., Bromley, Kent.*——The frost on the night of the 24th ult. was a trifle in comparison with the one we had last Thursday night, which was full 6°. The Potato crop is quite cut down; I saw a field of 10 acres black. All the newly bedded-out plants and Dahlias are quite destroyed. The havoc is disheartening in the extreme. *Charles Hudson, Saundby, near Retford.*

Collodion.—Can any of your correspondents inform me of any way of recovering the adhesive properties of spoiled collodion? I purchased a bottle of a respectable chemist, and the price of half a pint of collodion is of some consideration, but upon attempting to use it for horticultural purposes I found it totally useless. I have myself spoiled some before by too frequently redissolving it in fresh ether; but he assured me it had never had any fresh ether put to it since he had it from London, so I thought I was safe, especially as it looked as good as any I ever saw. But *fronti nulla fides.* It is worthless. Can it be restored? *Iota, Alford Vicarage.*

Societies.

Horticultural, *May* 23.—J. R. Gowen, Esq., Treasurer, in the chair. J. T. Brooks, Esq., E. Akroyd, Esq., J. Blyth, Esq., J. Vickers, Esq., and Mr. Alderman Muggeridge, were elected Fellows. Two general collections of vegetables were contributed: one of foreign growth from Mr. Lewis Solomon, of Covent Garden Market; the other from Mr. Smith, gr. to Mrs. Reay, of Wanstead, Essex. Mr. Solomon had a bundle of excellent looking white Asparagus, 75 heads of which weighed 9 lbs. 13 oz.; very fine Kidney Potatoes, green Peas and French Beans, four beautiful large Cauliflowers, Globe Artichokes, admirable Early Horn Carrots, and a punnet of large and highly coloured Tomatoes. For these a Silver Knightian Medal was deservedly awarded. A similar award was also made to Mr. Smith for the English collection. The latter, though, as a matter of course, very inferior to the foreign produce just mentioned, was a good example of skilful gardening, considering the very unfavourable winter and spring we have experienced. Of Plants, Messrs. Ivery, of Dorking, sent some charming Azaleas, for which a Certificate of Merit was awarded. Three of them—Beauty of Reigate, Barclayana, and Iveryana, were white, with some of the flowers stained and spotted with pink. The others were Gem, a glowing rosy kind, and Novelty, a salmon-coloured sort. The same firm also contributed two seedling Cinerarias, a Calceolaria, and a hybrid Rhododendron called ponticum coccineum, for which a Certificate of Merit was awarded. This variety had the deep crimson flowers of the red tree Rhododendron, which was evidently one of its parents, and the foliage of R. ponticum, which it resembled in all respects except in colour, thus uniting the brilliant flowers of the tender Indian kind with the hardy vegetation of the Black Sea. Of Orchids, Lady Dorothy Nevill, sent the rare Odontoglossum cordatum, a Guatemala species, for which a Certificate of Merit was awarded.—Half a dozen Royal George Peaches and as many Elruge Nectarines were furnished by Mr. Hill, gr. to R. Sneyd, Esq. A Banksian Medal was awarded for the latter, which were highly coloured, and very fine fruit for the time of year. From W. Everett, Esq., of Enfield, came a new garden implement, which, it was stated, might, in some cases, form a substitute for a rake. It had a long handle, on the end of which was a small roller or revolving cylinder, in which knives, or rather blunt plates of iron, were set lengthwise all round it, about 2 inches apart, and protruding from the roller about an inch. These were said to break clods quickly, and leave the ground in small ridges fit for sowing; it was mentioned that the rollers could be made of any length that might be most useful.—The Hon. W. Fox Strangways contributed specimens of an anomalous development of the wood of Arbutus Unedo, which looked exactly as if that species had been grafted near the ground on A. Andrachne. The stem had bulged out at the place in question till a large round excrescence had been formed; the health of the tree became impaired, and ultimately it was cut down, when, on splitting the part affected down the middle, the two distinct kinds of wood presented themselves; and what was most remarkable, the wood of A. Andrachne was evidently formed *below* that of A. Unedo. —From the garden of the Society came a well-flowered plant of the Chilian Mitraria coccinea, and an example of the Sikkim Primrose, a singular form of Cowslip found in that district of the Himalayas by Dr. Hooker. It has long slender stalks, surmounted by bunches of pale-yellow sweet-scented flowers. Among other plants, the same establishment also furnished two kinds of Cacti, both crosses between the flat-stemmed C. crenatus and the well-known C. speciosissimus. The effect of this cross has been in the one case to substitute the violet-shaded red of C. speciosissimus for the white colour of C. crenatus; and in the other, to replace it with pale salmon; while both have the advantage of possessing a very hardy constitution, which renders them easy to manage. Examples of Myatt's Linnæus Rhubarb also came from the garden, and some Lettuces, which were sent to show that sowing this kind of vegetable in autumn, and wintering it in frames, is not so advantageous as sowing it early in February in heat, hardening it gradually off, and planting it out in the end of March. Of the kinds thus treated, the spring sown ones were nearly twice as large and far more succulent than those sown in autumn. The attention of the meeting was now directed to some examples of textile materials furnished by Dr. Royle. They chiefly consisted of bundles of threads or prepared fibre from the leaf of the Pine-apple, from which it was stated the beautiful Manilla Muslins are made, and which was shown to yield fibre readily of great length and strength, and in any quantity. Of the specimens exhibited, some of which came from Madras and other places, one of the whitest and best came from Singapore. There was also shown some fibre prepared by Mr. Sharp from the long leaves of Bromelia Penguin, a plant plentiful in tropical America; and two specimens of paper, one white and of most beautiful quality, the other coarse and intended for packing, both manufactured for Mr. Sharp from the fibre of the West Indian Plantain or Musa.

Royal Botanic, Regent's Park, *May* 24.—This Society had an excellent exhibition on this occasion, and the day, although showery in the morning, kept dry in the afternoon. The effect of the new arrangement of placing the plants on Grass terraces, as described by us at p. 271, was very good, more especially in the morning, before the company entered; but, after the place had become full of people, the more striking features were very much lost, and the continually crowded state of the terrace-walk kept the persons below from seeing the plants above it. Nevertheless, the alteration must certainly be looked upon as a move in the right direction.

Stove and Greenhouse Plants, in collections of 16, were produced by Mr. May, gr. to H. Colyer, Esq.; Mr. Green, gr. to Sir E. Antrobus, Bart.; Mr. Speed, of Edmonton; Mr. Gillham, and Mr. Rhodes. In Mr. Colyer's group we remarked an excellent plant of the Willow-leaved Ixora (I. salicifolia), with foliage not drooping so much as usual, and covered with handsome orange flowers; also a very fine Clerodendron Kæmpferi; a large Everlasting, a capital example of the charming Cape Heath called E. tricolor Wilsoni, two Azaleas not over-abundantly flowered, Boronia pinnata, and a well-grown Dillwynia rubra sanguinea.—Mr. Green had admirable plants of Acrophyllum venosum and Franciscea confertiflora, the latter one of the very best of the genus, and the former a favourite with everybody. The beautiful Gardenia Fortuni, which was shown so fine at Chiswick, was still in good condition, the half-decaying flowers having assumed a delightful yellow hue; the little, slender-growing, yellow Gompholobium grandiflorum, and some excellent examples of Heaths, Everlastings, and Azaleas.—Mr. Speed sent the Java Ixora, beautifully flowered and finely grown; the blue Leschenaultia, in equally good condition; a well-bloomed Stephanotis, Azaleas lateritia, variegata, and Gledstanesi, all united in one plant, the different colours producing a fine effect; and an example of the very pretty, though rarely seen, pink-flowered Hypocalymma robustum.—The more striking plants from Mr. Gillham were Stephanotis floribunda, Rhynchospermum jasminoides, Clerodendron splendens, Gardenia Fortuni and Statice macrophylla. Mr. Rhodes had Stephanotis floribunda, and the buff-coloured Erica Alberti, in unusually good condition.

Stove and Greenhouse Plants, in collections of 12, were furnished by Messrs. Fraser, Rollisson, Clarke, and Pamplin. In Messrs. Fraser's group, which contained well-grown medium-sized plants, were two nice Everlastings, Azalea optima, Leschenaultia Baxteri, and Pimelea Nieppergiana, the latter a handsome white-flowered species, very suitable for persons of limited accommodation. Among Messrs. Rollisson's plants were Cyrtanthera magnifica, a gay Justicia-like plant, each shoot terminating in a showy head of rosy flowers. Acrophyllum venosum, Adenandra fragrans, the Oleander-leaved Allamanda, and Erica ventricosa magnifica, which is universally considered to be one of the handsomest of its class. In one of the other two groups we remarked a charming example of the pretty Erica tortuliflora, a Heath which must ever remain a favourite.

In Collections of 10 Stove and Greenhouse Plants there were no fewer than nine exhibitions. These were contributed by Messrs. Dingle, Carson, Williams, Clarke, Barter, Peed, Morris, Jarvis, and Hamp. Mr. Dingle, who is gr. to A. Lawrence, Esq., of Bath, sent two good Everlastings, Azalea rosea punctata, quite a pyramid of flowers; Acrophyllum venosum, in good condition; also the Cavendish Heath, Pimelea Hendersoni, and Franciscea calycina, the latter beautifully flowered. Mr. Carson produced a good Allamanda cathartica, Adenandra fragrans, conical in shape and well grown, but insufficiently in bloom; Gardenia Fortuni, and very conspicuous plants of the Azaleas variegata and lateritia, the former representing, as it were, a column of

bloom some 5 feet in height, the latter equally full of blossom, but more spreading. Mr. Williams (gr. to Miss Traill) showed good plants of Azalea Murrayana, a glowing crimson-flowered kind; a very large Erica Cavendishi; also Franciscea acuminata and Pimelea decussata, the latter handsomely grown, but insufficiently in bloom. In the other groups we remarked Clerodendron Kæmpferi and splendens, Pimelea spectabilis; the yellow flowered New Holland Hibbertia Cunninghami, Ixora coccinea, Javanica, and Griffithi, all well flowered; various Polygalas, Euphorbia splendens, different kinds of Azalea, a very highly coloured Erica, Westphalingia, Hoya imperialis, and the charming little Hoya Paxtoni; the Oleander-leaved Allamanda, and Medinilla Sieboldi.

Groups of 6 STOVE and GREENHOUSE PLANTS were shown by Messrs. Taylor, Roser, and Over. Mr. Taylor had Ixora crocata in a young state, and not more than a foot high; but, nevertheless, covered with orange flowers; Erica elegans in good condition, and a Leschenaultia. Mr. Roser contributed some well-grown Azaleas, Heaths, and Everlastings; and Mr. Over furnished a small but good Hoya imperialis.

AZALEAS were shown in great quantities; but they were scarcely so fully in flower as they were at Chiswick. Collections of 3 plants came from Messrs. Lane, Fraser, and Green. The lion of Messrs. Lane's group was undoubtedly his noble plant of Perryana, whose thickly set, large, well-formed, glossy flowers commanded universal attention. Messrs. Fraser also showed a good plant of the same variety; a specimen of Double-red, badly coloured; variegata, violacea superba, and magniflora, all well grown and flowered. The most striking of Mr. Green's plants were the Chinese yellow and Iveryana, the former of which was a magnificent specimen, quite covered with bloom. Groups of six plants were contributed by Messrs. Carson, Barter, Taylor, and Gillham. Among these were good examples of variegata, sinensis, Double-red, Murrayana, exquisita, præstans, a semi-double sort, of a striking purple colour; Smith's Broughtoni, and Minerva, a fine kind, and very brilliant. Plants in 11-inch pots were contributed by Messrs. Roser, Fraser, and Taylor. The first group consisted of alba magna, Aurora, variegata, and lateritia, united in the same plant; optima, variegata, and formosa. The other collections contained Gledstanesi and variegata in the shape of standards, semi-duplex maculata, Iveryana, delicata, and Broughtoni. Mr. Ivery, of Dorking, reproduced the plants described in our report of the Horticultural Society's meeting in another column.

Some tall Cacti were shown by Messrs. Green and Gillham, but we did not find that the varieties were very different from what were exhibited at Chiswick.

Of RHODODENDRONS Messrs. Lane contributed plants of delicatum, delicate pink; aureum superbum, a good yellow; carneum, buff slightly suffused with pink; Javanicum, and Sabinianum, the latter in the way of, but not so good as delicatum.

ORCHIDS.—Collections of 20 were contributed by Mr. Williams and Mr. Woolley. The former had two Cattleyas, three species of Aerides, the charming Saccolabium præmorsum, Vanda tricolor and V. suavis, Dendrobium Pierardi, Trichopilia suavis, beautifully flowered; and large and fine plants of the Wallich Phaius, and the Veratrum-leaved Calanthe. Mr. Woolley produced the same Dendrobium Farmeri which he had at Chiswick, but this time in better condition; also Barkeria spectabilis, and Vanda suavis, scarcely so highly coloured as Mr. Williams' plant; the singular looking canary-coloured Peristeria cerina, and Cattleyas Skinneri, Mossiæ, and intermedia.

A group of 16 plants came from Messrs. Rollisson, in which were examples of Arpophyllum giganteum, a small plant, poorly flowered; Anguloa Ruckeri sanguinea, the yellow Cattleya citrina, Cypripedium caudatum with two flowers, each furnished with very long tails, Odontoglossum nævium, two large Sobralias, a beautiful Phalænopsis grandiflora, a Cymbidium, and Dendrobium moschatum.
